Ammonia. Uses of.	261
Androscoggin Sporting Club circular proposing a State Tournament.	395
Angling. Lore and Literature. Ancient—Wilkinson	18
A. Macle Virtue on.	58
Angling. Science of.	138
Angora Goats in Guadalupe.	398
Answers to Correspondents. "By Ollipod Quill."	
Cabbage worm. How to kill.	373
Cucurlo on the Plum.	389
Elm Flea.	405
Fig Tree. Where it will grow.	405
Gooseberry Caterpillar. How to exterminate.	405
Moss. How to eradicate.	405
Potato bug. How to destroy.	405
Scale insects.	373
Worms in plant pots.	373
Answers to Correspondents.	
Adirondacks to. Best route from Washington.	343
D. C.	311
Board for a Boy. Cost.	391
Blue Mountain Lake.	391
Can a boat be hired in without a guide?	279
Fishing. Best points for.	375
Maps. The best.	295
Region. Best for fly-fishing in.	215
Alligators. How to transport.	183
Andaman Islands. Latitude and Longitude of.	71
Aquarium. Green deposits on sides of. How to prevent.	103
Atlantic City. Expense per day of shooting in.	23
Barnegat for bluefish. Where to stop.	231
Bass, black and pickerel. Where to find.	120
Bass, black of Kalamazoo and the fly.	215
Bass, black for stocking ponds. Where to get.	7
Bass, black. Where to procure for stocking a fish pond.	71
Bay of Fundy. Where to lodge.	375
Bird lime. How to make.	135, 167
Birds for scientific purposes. Right to shoot in the close season.	135
Birds. How to stuff. A concise work showing	103
Birds. Skins of. How to preserve.	151
Black flies. Preventive.	311
Boat or canoe transportation. Cost of.	120
Boating. Single scull race for a man weighing 160 lbs. Dimensions for.	199
Boats. How to make them waterproof.	167
Boys. Where to camp out.	295
Brass shells. How to cleanse.	407
California, quail and pinnated grouse in.	87
Camp stove. Where to buy.	247
Canoes, bass wood. Builders of in Ontario.	263
Caribou hide. Use of.	55
How to dress.	135
Caribou shoe packs. Where to procure.	120
Collingwood to Sault St. Marie. Table of distances.	279
Colorado. A two months' trip. Cost of, with other questions and answers.	231

For Forest and Stream.
A RETROSPECT.

WHERE the Androscoggin rises,
'Mid the waving pines of Maine,
Rushes o'er its pebbly bottom,
Swelled by spring and autumn rain,
Three charming lakes of wide expanse,
Lie sheltered by the leaf-clad hills,
Whose sparkling waters gather strength,
From coolest spring and clearest rills.

Beneath their waves the wary trout,
Cleave the clear water as they play,
Or, tempted by the bright winged fly,
Dart to the surface for their prey.
The screaming loon betok'ning storm,
Swift cuts the air in stately flight,
Or proudly sailing with the breeze,
Dives deep to escape the fowler's sight

On the green banks the lofty trees
Fling out their branches to the sky,
Now sighing with the morning breeze,
Now echoing to the cuckoo's cry.
The air is filled with sweet perfumes
Of fragrant mosses and of vines,
Mingled with odors grand and full,
From hemlock, balsam and the pines.

Charming retreat from haunts of men,
And city's busy, bustling strife,
I long to tread thy shores again,
There to renew my "lease of life."
The bracing ride on stage coach top,
The murm'ring stream, the village bell,
The shadow on that range of hills,
Whereon my eye delights to dwell;
The throwing off of every care,
The easy lounge and grateful rest,
Staunch buckboard, way-side spring,
Each in their turn give zest.

I long to joint my tapering rod,
And cast the bright and tempting fly,
To see them float upon the stream,
Or hover 'twixt the lake and sky;
To watch the rise, to swiftly strike,
To feel the breath come hard and thick,
To press my fingers on the reel,
And hear the music of its click.

* * * * *
"Come, see! the west is tinged with red,
The cove is gently rippled o'er,
There's waiting sport for us to night,
We'll net, my boy, at least a score."

* * * * *
"Just one more cast, I yet can see
That miller's white and dainty wing—
Hold! there he comes, strike quick and hard,
Oh! don't he make that leader sing.
He's doubling on you, look out, sir!
He knows the game, just see him cut!
I'll risk my rod to save that trout,
Stand by now, Frank, he's got the butt.

It bends—almost a circle now,
There's music—not another inch;
Good bye old rod, you're staunch and true,
But yet—ha! ha! sir trout, you finch.
"He's winded, sir!"—"the net please, Frank,"
(Head first my beauty, if you please)
He'll turn the scale at four sir, sure,
Well, that's not bad for joints like these.
Up anchor boys, the shadows fall,
The mist is slowly settling down;
Said one as trudging to our camp:
"God made the country, man the town."

Boston, February, 1874. CHARLES W. STEVENS.

—A white oak tree measuring twelve feet in diameter, was lately cut near the house of Mr. Rinaldo Sammis, near Middleville, Long Island, to be used for a new yacht. It is supposed to be one hundred and ninety years old from the circles through it. Mr. Sammis's father was offered \$100 for it years ago, but refused to have it cut.

—In Biddeford, Maine, the liquor dealers have become so impoverished by the enormous amount of money they have paid into the treasury by way of fines, that they will soon be compelled to throw themselves upon the town in order to realize a comfortable livelihood.

Yachting in Florida.
NUMBER ONE.

EDITOR FOREST AND STREAM:—

IN your references to yachting, it is observed that this amusement is for the present suspended, and well, indeed, may it be in all branches except refitting and laying keels and plans for new triumphs, for the storms of our frozen north render anything but attractive the waters that in summer invite the white winged beauties that so delight a sailor's eye, and they are now deserted by even the storm-loving sea fowl. But if we do as the birds do, and follow the sun, we can find a point where ice and snow are but occasional even in mid-winter months, and as beautiful waters for sailing and boating as the yachtsman, fisherman, or sportsman can wish for, and fitted for any variety of craft, from the steam yacht to the dainty Rob Roy canoe. There is a combination of pleasure in boat life that is unrivalled, and it is a matter of regret that with our magnificent inland waters, some among them attractive at every season, so little effort has been made to render more simple and economical the methods for enjoying them. Our steamboats are perfection, and he who will go by time card, and with half the population of a city as companions, may be wafted along like a prince, and find at hand every luxury of life; but if he will go or tarry at will, hasten or linger as tempted at the moment, there is less chance to do it with any present arrangements than on the Nile or Amazon.

A witty lady is reported as having expressed an intention of renting her town house and buying a "drawing room ear," to go freely from point to point, and it may be that in due time arrangements may be perfected by which a small party can charter a plain, roomy car—not one of royal character—and go from Quebec in October to Florida in January, and be at all points "shunted" on to a fashionable switch, in a "good locality," to remain as long as the inducements justify. Think how nice to lay in some creature comforts, a few good books, and hang rods and guns overhead in a clean, roomy car, and go in July to New Hampshire, and be run on a special branch, a little remote from the howling demons of night trains, and more remote than half the wayside hotels. No snubbing from superb clerks, no weary stairs, no attic, or risk of bad air from rooms over the kitchen, and no rough and tumble for place; no two hundred per cent. profits to pay on Jersey wines, and no new daily servant to fee and reduce to half service. *Ciel*, how the idea glows with visions of a little porch at one end of the car, with a railing at the altitude of two degrees of comfort for a foot rest, and two or three Shaker chairs for smoking! How many a place our railways now reach where there are no decent hotels, while all about many remote stations are scenes of endless beauty, streams that are hardly fished, and prairies that abound in game. Remember the valleys in Pennsylvania, the gorges of New England, the ponds and mountains of Nova Scotia, and the marshes and covers of the west, and see the promise there is before us when we go in our chartered car. How charmingly fit for fair companionship! Even the Benedict who cannot leave his family may shoot and fish with the youngest, while madam can sketch, photograph, or botanize, and fill her fernery from the shades of every latitude. Fit up a nursery on board and take the little ones; give them the clear air of Colorado, and a winter on the Pacific. Take the family physician, a seamstress, and a good cook. Attach a little gearing to the wheels that will beat eggs, turn the freezer, and operate the best patent washer, and the "only real eog adjustment" wringer, and will run half a dozen mechanical toys and turning lathes to enliven the sage barrens or the southern pine lands, and add, if it is liked, a hand organ, to play softly all night to overcome with dulcet tones the low rumble of *papier maché* wheels.

As to the expense, if Americans propose, after rendering Europe extravagant, to take thought, like John Gilpin,

"who tho' on pleasure bent had yet a frugal mind," and look at sum totals of dollars and cents, why for their comfort be it said, and, fun aside, it may be said with all the assurance of a circular "calling your attention to an investment of unusual desirability," that such travelling can be made as much cheaper than what is now paid at our gay resorts, as it would be more independent and agreeable.

But all this is not yachting, nor anything resembling it, except in freedom of motion and independence of having our quarters always at hand, and, be it confessed, your correspondent's pen has fallen into a wandering vein, as it often does. So for a time let the project of a "Grand Union Company," for furnishing tourists with transportation and all the comforts of a home *en route*, remain undeveloped, while we take a reckoning and see whence we have drifted.

Having allowed us so much latitude, permit a further passage unrecorded from the icy hills of Central New York, and the unequalled slush of your city, to the "right smart" city of Jacksonville, lying when we first saw it as a long line of lights, doubled in reflection along the St. John River. It was in February, our most bitter month, but there was no sign of the bondage of winter there. At the hotel all was like July at a watering place. The doors were open to the evening air, a band of genuine darkey minstrels were playing and dancing in the hall, and in groups about the parlor doors were girls in summer dress, their hair and dresses festooned and decorated with long Spanish moss and garlands of fragrant jessamine. It was very charming, coming in fresh contrast to snow and cold; a spring, indeed, without the terrible family quarrel among the seasons that renders so fitful and uncomfortable the coming of our northern summer, and, for a few days, idling and basking about seemed interest enough, when just as an impulse of restlessness came on an invitation came to make a third in a party of gentlemen in an expedition up the river. It struck the key note of what proved to be a pleasant harmony, and an experience although brief, and not eventful, was so very agreeable that it may justify a place among "Southern Sketches." The pioneers in the project had chartered a small steam tug, and her crew of captain, engineer, and cook. To do the odd work a darkey boy on the dock volunteered, and was taken.

A day or two was passed in preparation; and what is more agreeable to a thorough sportsman than collecting his traps? Who would let any do it for him any more than place love making in other hands? Getting out well used rods and guns brings up so many associations of wild wood camps and hunting adventures, while as they are tested and put in order anticipations fill the mind of the new scenes to be enjoyed, with high hopes of great success in bags of game of novel kind and character. We had a merry time getting ready. Our captain, an excellent fellow, went with us to the shops, where selections were made, and they went under the care of grinning negroes to the dock. Such a lot of traps, too! When at last our little boat swung away, and turned her snub nose against the lazy tide, our final adieux were waved to our friends, and as we turned our hands to taking possession it was with dismay at the pile of what may be called housekeeping things staring us in the face. At it we went, marked our individual tin basins, and cleared the corresponding pieces of slippery soap out of the way. We hung guns overhead until our heads were in imminent danger, and drove nails into every space for something until the walls were like the fitful porcupine. And yet there were so many things all wanted in immediate readiness, that all could not be on top. The captain left the wheel and lent his aid and counsel. Lockers under the seats were developed, fortunately capacious ones. One was made arsenal and magazine, and filled with powder enough to blow the boat up, and lead sufficient to carry her down. Another was cellar. Into it went liquid sunshine from the hills of France, and rosy wines from Italy, saying nothing of a "wee summat" to correct the influence of rain water, and to fortify against miasma, (also recommended for snake bites).

Our system of domestic life was superb; tin ware, china,

and cutlery were cozily packed with sugar and salt, ham, sardines, and crackers, so snug that surprising combinations resulted, and generally similar flavor indicated the intimate relations that existed when the covers were down and the heavy man of our party sat upon them. The final adjustments were informal, but a place was found for everything, even to the corkscrew, and sometimes we were so fortunate as to recall some clue that led us to the place where things were to be seen again, and the right thing would occasionally come to light. Rather proud of our domestic achievements, having as yet made no attempt at exhuming anything, we went with placid satisfaction to the little bow deck—just room for three—and called for camp chairs. Settled in them, we found it as delightful as possible. There was nothing before us but the flag staff, and that was ordered down, when our eyes gazed upon the royal river, nothing obstructing the view of the sky, bright water, and shores of varying attire. Our speed was not great, and there was no disposition to hurry.

All that surrounds one at the south is suggestive of and in unison with rest, and nothing is more grateful. At the north it is not so; energy and haste seem the spirit of animate and inanimate life. The wind blusters and frets in an eager way, while the clouds drive on as if their haven was not yet found. The surf on the rocky shores is not the low, long tone of the strand; it essays the conquest and crumbling of the rock-bound coasts, while the streams hasten on their way to the sea, cutting corners like messengers, and turning a whirl here and there with an expression of relief at getting away from a temporary delay in the quiet pond. And are we not too much the same? Do not northern men wear away in efforts to save time, and never command leisure? Are not brains mazed by efforts to save and systematize that only increase complexity? Do not our women assume care to preserve and protect their beautifully furnished homes until their chairs and fragile china outlast their weary lives? Can minds always engrossed really see what is laid broadcast of beauty and interest any more than ruffled waters can reflect the sky or beautiful shores; and does not our laboriously assumed discipline of habit finally become a power that cannot be shaken off even if weakened vitality warns that it must be done? But our bows were unbent, and our surrender to the peaceful influences was unconditional. The broad, quiet river bore no evidence of the centuries that have passed since the first adventurers explored it for the fountain of youth—a fountain that, undiscovered for man, assuredly maintains the evergreen vigor of this remarkable stream. Known longer than any river on the continent, it is the same to the eye as when the first boat passed over it. At hardly any point are there breaks in the line of foliage that crowds to the water's edge, and miles and miles did we pass on, seeing no evidence that the swells from our boat were not the first that set the water lilies nodding a friendly welcome.

The lower river is too wide for game, being often ten miles from shore to shore; quite sea room enough for a yachtman's skill, and water enough for a good sized craft on nearly all stretches. From this wide water we turned into Black Creek, where we were promised shots at alligators. This is a very beautiful stream, about one hundred yards wide. The alligator is very much like our northern turtles in his manner of life, and, like them, enjoys sunshine on his scaly form. We slowed the engine and went on very quietly, keeping near the sunny bank of the river, half forgetting at times our purpose in admiration of the same. The alligator is not easily seen by a novice among so many new forms to catch the eye. Their scaly backs, when dry, are precisely the color of bark, and lying on or by fallen trees their form assimilates so closely to the decaying trunks that we were unable to distinguish them at first, even when our small imp of all work would grimace like a monkey in efforts to point them out. We did not admit with candor that we did not see them, but bravely fired away, and kept up an expression of entire wisdom, even when in response to hurried shots chips flew from logs that were not very near the splash made by the escaping saurian. One or two were hit, and when wounded gave a display of power that increased our respect for them. Smashing about, they made the foam and water fly like a propeller wheel on a tear, but almost invariably retained enough vitality to get to the bottom, where the body remains in the mud and grass until, expanded by decomposition, it rises to be food for swarms of turkey buzzards. We continued this rifle practice for some time, until the long shadows covered both banks, when the alligators, as dependent upon sunshine as butterflies, went into their slimy homes. Then we turned to reach the open river before dark, let on more steam, and laid aside our rifles to enjoy the scene. It was wonderfully fair. Foliage of new forms pressed out over the water, vines laden with bloom hung like Narcissus over the flood lost in their reflections, ducks swam hastily on before us, drawing a wake that became long rays of light, and overtaken took long circles back to the quiet scenes we were leaving, while on the topmost branches of tall trees turkey buzzards sat in rows, waiting like ghouls for death and decay to lure them down. They were unmindful of rifle balls; safe in worthlessness they surveyed the scene their repulsive forms marred, and when the shadows were almost as dark as their sable wings we were glad to enter the open river. Over the bar, with full steam, we pressed on as long as we could see, and then tied to a deserted wood wharf for the night, lighted up our little cabin, had our supper, a few glasses of social wine, and then turned in to dream of semi-tropical life.

L. W. L.

—Twenty four race horses, ten ostriches, and six antelopes arrived per steamer Schiller on Friday, all consigned to Mr. Barnum, for use in his new hippodrome.

REMINISCENCE OF LAKE SUPERIOR. NUMBER TWO.

BY THOMAS SEDGWICK STEELE.

IT was with a hearty laugh that Dr. W. bounded into my room one bright morning in the latter part of September, without waiting to knock or in any way announce his arrival. In almost the same breath he called out, "Why! you're a pretty fellow to be housed here all day long, fusing over those feathers and wires! Why are you not on the river trolling, or in the woods after partridges? Come; put up those tools and lets off for a day's tramp. Peter has put up enough luncheon for two, so pick up your gun and come on." The fact was, that for the past week I had spent a great portion of my time stuffing birds. I had collected some two dozen, peculiar to the Lake Superior region, and had packed them away preparatory to leaving on "the last boat of the season." At the present time I had under consideration a Canada jay or "Whiskey Jack," as they are sometimes called, and was manipulating it in the usual manner. I had just turned the skin of the bird to its natural position and was making a body of hemp as near the size of the original as possible, when the Doctor entered and accosted me with above salutation. Doctor W. was an Englishman, but, instead of possessing the rotund figure which "John Bull" is always supposed to have, he was tall and slim, with that restless activity of manner and overflow of fun and jollity which are the proverbial *dignity* of an Englishman. He was "a hale fellow, well met" and consequently a favorite with all. His bright face alone brought relief and happiness to a sick room, and as a companion in the woods, he was everything that could be desired. All these attractive qualities were really the secret of his success as a physician—setting aside the fact of there being no other within a radius of thirteen miles. It would indeed have been a *brave* man who could venture to "hang out his shingle" in competition with Doctor W.

Although loath to leave my bird half finished, I knew the Doctor's company would well repay me, so I carefully smoothed down the plumage and depositing the skin in my drawer, looked about for my gun. To most people, my room might not have been attractive, but to me, as a sportsman, it was perfection. The pegs around the room, not covered by wearing apparel, were decorated with fishing rods, creels, nets and all the paraphernalia of an angler, while in one corner, carefully packed in cotton, were skins of birds and jars of agates which I had collected during four month's occupation of the premises. In one corner lay my game bag and a pair of deer's antlers, while last but not least, stood my ever faithful friend, my gun. To throw on my hunting coat, whose numerous pockets were made to contain everything from game to percussion caps, was the work of an instant, and shouldering my gun, I locked the door and followed the Doctor down stairs and out into the street. It was a lovely morning, bright, clear and frosty, with but little wind to stir the waves of old Superior, in whose mirror-like surface was reflected the deep blue of the sky. With one long lingering look down the Lake to see that no steamer was in sight, (as their arrival always made a holiday at Ontonagon,) we turned our backs on the scene, and passing through the town, followed the old corduroy road into the woods. Occasionally we stopped to pick a few berries, the last of the season, to snatch a few ferns from the wayside or to cut from some old stump a pretty bit of moss. It would have been better for me if, for once, I had let the "pretty mosses" go, for a favorite hunting knife mounted in ivory and silver, a relic of "our late unpleasantness" may, for aught I know, be still sticking in that old stump or some friendly Indian may have slipped it into his belt ere this. If so, I can safely assure him that he has secured a first-rate piece of cutlery. Mile after mile we plodded up the road, our dogs working in the woods to the right and left, occasionally starting a partridge which fell by the Doctor's unerring aim. Through the stillness of the woods came the sound of the great treepecker or woodcock of the northern woods, his body of black and white feathers, almost as large as a partridge and a crest of vermillion that would put a sunset to blush. Soon we came to the thickest part of the woods where the great trees encroached on the road, and tossed their long branches into dangerous proximity to the stages for the mines. Although the morning was calm, not so had been the night previous, and across our path lay numerous mementoes of the gale, around which we had to work our way. While passing through one of these thickets of fallen branches, our dogs came to a point. Cocking our guns we made ready for whatever should be flushed. The next moment, whirr-r-r, that music so melodious to all sportsmen's ears, and up sprang two partridges, the Doctor covering one and I the other. The smoke had hardly cleared away when up sprang another brace, followed almost immediately by a single bird. Being wholly unprepared for quite so many in one spot, we only knocked two, Dr. W. missing the last one. It was with great difficulty we could restrain the dogs and prevent them from rushing in, as we had not as yet retrieved a bird. But it was well we did, for a few feet further on Spot came to a point, backed by Hero in the most graceful manner possible. The undergrowth was very thick, long vines stretching from tree to tree, and across our path in every direction innumerable slippery branches covered the ground, but as Spot very seldom deceived us we pushed forward to where he stood. The Doctor, who was a little in advance, had hardly reached the dogs when up sprang another brace of partridges which he dropped with his right and left barrel. Re-loading, we "quartered" the ground, but not another bird could be

flushed, so, picking up those we had killed, we returned to the road, satisfied in bagging six out of a flock of seven. Where that seventh bird disappeared we never could discover; possibly into a swamp hard by, but we contented our minds with the thought that some other sportsman would retrieve him and that we ought to be generous. On we tramped along that corduroy road, every foot of which is so distinct in my memory, until we arrived at an old log house, a few rods back from the road, at whose door we knocked and were greeted with "come in" from a remarkably healthy pair of lungs.

The hut contained but two rooms, the latter of which could hardly be called a room, but rather a shed, and contained wood and various tubs arranged for the week's washing. In the centre of the main room stood an old-fashioned iron box stove, while from the rafters above hung sundry ears of corn, asparagus branches and hams. The female members of the family were grouped around in various corners while the brawny head of the house sat resting one arm on the table and smoking an old clay pipe. To our request for a "glass of water" we received a decided "no," but the "Lieut. Governor" of the family finally produced a cup of milk, saying that the well had given out and the spring was half a mile distant, but if we would accept of this, (holding forward the cup,) she would be pleased. The cup was of stone china, had evidently seen better days, and been younger and prettier. The handle was gone and the edge looked as if it had withstood a charge of grape and cannister, while numerous dark spots confirmed the fact of there being no water in the house! But we were *very* thirsty and had a walk still of four long miles before we reached another house or the mining town of Rockland, towards which we were bending our steps; so, shutting our eyes, we each in turn lifted the cup, and it was all over! Thanking them for their kindness, we were soon deep in the woods again, hoping that another bird or two might fall to our bag. We were not disappointed, for we soon flushed three others, all of which fell to our hand.

We had now entered the mining town of Rockland, and passing through its muddy streets, wound our way up the hill to the mines on its crest. Here we rested our weary feet and gazed down on the village below. To the south of us stretched an almost endless forest with hardly an opening, the bright autumnal foliage in strong contrast with the dark solemn pines. At our feet lay the village with its ever busy inhabitants, its low log houses and its noisy dogs and pigs, a very fair sample of a western mining town. Occasionally a few notes of a flute or violin would be wafted to our ears, for a Cornishman's house is hardly complete without some kind of a musical instrument. To the east and west extended the mountains of the great mineral range, dotted here and there with the "pepper box" shaft houses, while constantly could be heard the chinck, chinck, chinck of the skips as they were drawn out of the mine and the roll of the rock as it rattled down the hill.

After we had sufficiently recovered from our walk the Doctor suggested that we should vary our tramp by a trip down the mine, provided we could find a "Mining Captain," (as they are called,) who was "golog in" at that time. So we immediately repaired to the "change house," and depositing our guns, game bags and other equipments, and securing the dogs, we doffed a portion of our clothing and arrayed ourselves in heavy canvass jackets and pants. Our heads were crowned with odd-looking hats, as hard as sole leather, something after the shape of Esquimaux huts. These were to protect our heads from falling rocks while down the mine. Following the directions of the Captain we rolled a tallow candle in soft clay and sticking it on to the front of our hats, picked our way over the rocks to the shaft house, and entered the shaft through a hole only just large enough to admit one's body.

As soon as daylight disappeared the Captain ordered a "halt," to impart a few instructions necessary to our safety. From the top to the bottom of the mine extended ladders which were securely fastened to the sides of the shaft, and the Captain's most important warning was that we must never let go our hold of one round of the ladder until we had firmly secured another, else a remarkably sudden trip of twelve hundred feet would be the consequence. Gradually we began the descent, hand over hand, round by round, until we had reached what is called the "first level." Taking breath, and pushing the clay from the wicks of our candles, which still adhered to our hats, we slipped a few feet to the right and continued downward on another ladder. On the sides of the rock underneath us ran a rapid stream of water, continually fed by hidden springs, while on all sides the dark damp rocks seemed ready to crush us, so closely did they seem to press, but nothing daunted we continued our downward way. To the left lay another and larger shaft, through which we could see the "skips" filled with copper and rock passing and repassing, to which were fastened copper ropes, running over pulleys and operated by an engine up above at the entrance of the mine. By this time we were decidedly cold, and our hands and wrists all covered with soft sticky clay, which made it extremely difficult to retain our hold on the ladder, but hold we must. Down and farther down, until the bottom of the mine is reached, 1,200 feet below the surface, when removing our candle from its exalted position on our hats and shading it from the air, we groped our way along in the "level," expecting every moment to make some unlucky step. The blasts in other parts of the mine sounded like distant thunder as they echoed along the gallery.

Away up in one part of the rock men were "stopping" or following a vein of copper, the musical "chinck, chinck" of

their hammers and drills falling faintly on our ears, but immediately turning aside we passed through the "level" and entered a large room where, supporting the rocks overhead, were massive timbers some three feet in diameter. Here, we were informed, a few years ago was taken out a mass of copper which weighed six hundred tons and which required eighty barrels of powder to blast it and thirty men over a year to cut it up and raise it from the mine. Soon we were obliged to lie flat upon the ground, and by means of our hands and elbows, work ourselves through a small hole in the rock; and in that manner we entered another room or cave where eight miners were engaged at their work.

Quitting this noisy place, the Captain taking the lead, we followed him to another gallery, to which we must needs pass over a shaft 500 feet deep, on one of the most slippery logs that ever mortal traveled. We had hardly reached the other side before our ears were nearly deafened by another tremendous blast much nearer than the last, and the room was immediately filled with smoke, so we could hardly see, much less breathe, but feeling our way along, with the help of the Captain's hand, we passed over a great ledge of rocks and up into a better atmosphere.

The Captain now took from his pocket a curious-looking brown parcel and asked if we would like some "crib," or what a miner calls dinner. Crib is a composition of meat, potatoes, bread and other compounds mixed, seasoned and baked into a pie—not a very tempting morsel certainly, but our appetites were sharpened by hard exercise, and remembering the proverb, "When you are in Rome do as the Romans do," we accepted the offered "crib" with thanks. While thus engaged we had time to gaze around us, and what a sight met our eyes. The roof over our heads was one mass of glittering ore and rock. Great veins of bright copper seamed the grey rock, while here and there were traces of silver and masses of snow-white quartz, which, sparkling in the light of our candles, suggested to our minds a fairy grotto. We sat some time enjoying this picture and absorbed in wonder, until the cold damp atmosphere of the place warned us of the danger of delay, so crawling along over still larger boulders until this means of progression became exceedingly painful, we entered another rock-bound chamber. Here we found the greatest number of miners we had yet seen, men down on their knees holding long drills, while above them others swinging the huge hammers. On the sides of the rock they had fastened their candles, whose fitful glare, lighting up the huge cave, combined with the tremendous noise of the hammers, made the place seem like a perfect Pandemonium.

Leaving the men at their work we passed along a dark gallery, and by a deal of climbing reached a ledge of rocks, where, through a small opening, we obtained our first ray of sunlight, and by means of a rope drew ourselves hand over hand out of the mine. Oh! how delightful seemed the "blessed sunlight," and although the day was cool, how hot the air seemed in comparison with the dampness of the mine. We drew in long draughts of the fresh pure air and sat for a long time enjoying the bright sunlight, while we congratulated one another upon the success of our novel expedition. Then a "happy thought" suggested itself and we at once repaired to a neighboring "photograph ear," where, with pick in hand, candles on our hats and mining clothes covered with clay, we made a picture which we have carefully preserved as a *souvenir* and which has proved to our friends a great source of amusement ever since.

MISERY RIVER.

EDITOR FOREST AND STREAM:—

MISERY River is not a pleasant name, yet a world of pleasant associations cluster around it in the minds of many fishermen.

It winds with many a deep eddy and black alder shaded pool out from the forest that guards its sources. For a hundred yards or so it laughs like a girl, and then smoothing down its ripples into matronly sedateness, moves slowly down for another hundred yards to the reeds and pea grass that margin Brasher Lake, and then softly expands into shallows where knee deep the blue heron sentinels its gateway into the lake.

The lake is bounded by forest, and most of the open part of the year a pencil of smoke above the trees marks some fisherman's camp, and gives solitary sign of human life. Some three hours of canoeing will carry one across the little lake and down the outlet leading to the broad and rough waters of Moosehead Lake, to where Mount Kineo rises Gibraltar-like behind the Kineo House.

A weird story is told of a French voyager buried at the mouth of Misery river, and the Miserere chaunted over his remains at vesper time gave the name to the waters. I looked for the cross that marks his grave. It was't there. I asked the guide, he said, "I guess that yarn was got up by some of the wimen folks."

It was in September, in the year of our Lord 1873 I first cast line in these waters. Two friends camped in the big pine woods, and with early dawn drifted out in their birch canoes for the morning fishing. The day was soft and warm for that cold country. The tops of the hills were ruddy with sunlight, but the mist marbled the still twilight lake and rose here and there in little rifts. Our canoe moved slowly up through the grass near enough to cast over the beginning of the channel. As we advanced our lines fell softly on the dark water, now in the channel, then among the lilies that marked its edges. More and more slowly we moved just abreast of each other, carefully covering the narrow channel as we advanced. If we

spoke it was in low voices, and the boatmen said never a word.

Right at the edge of the lake is a deep pool where the channel seems to divide to enter the lake, and by common consent we halted and patiently tried every part of the pool, but no fish rose to the line.

"Much cold," quoth the Indian who paddled me. We changed flies and put on brighter ones than before. A yellow butterfly, a fellow with red body and a striped jacket. We tried them again in the pool, but no rise, and our canoes drifted listlessly onward. There is a row of low bushes thirty yards in length growing out of and over the river. They are on the left bank in ascending, and the opposite side of the river is grown up with sedge. Every fisherman who reads these lines will remember those swamp alders mixed with wild roses, and how black the water lies below them, with here and there a white speck of foam that had drifted down from the ripples above. A venturesome insect that had roosted on these bushes during the night essayed his morning flight. His limbs were heavy with mist, and he fell into the water, but right away arose again and skimmed the surface, touching here and there as he flew, when a trout sprang after him with such hearty good will that he threw himself out of the water, striking the bushes in his fall and scattering the drops of dew in showers.

"Ha, ha," ejaculated Woodhull who was paddling the other canoe. "Eh," said my Indian guide. The canoes wheeled around facing the bushy bank, in an instant our lines were thrown back in circling folds over the sedge and then flew forward folding down straight threads of silk on the water. Our flies dropped on the edge of the bushes, slid off into the water, and slowly answering to the beckoning rods came towards us step by step.

The same fish that had startled us, with the same rush pursued the tinsel lure, and in a thought of time was fastened on my friend's hook. Down he went into the depth, and then for the lake, the line sawing the water as the rod held it taut, and then back and forth he wheeled until wearied with the struggle he came to the surface, showing his burnished gold and vermilion side for an instant, then frightened by the sight of danger away he went again, and thus back and forth until at last the net received him and he was laid in the canoe, the first trout of the river, and weighing just two pounds. What a royal beauty he seemed as with our canoes side by side we looked down on him and admired his chameleon hues and lithe form. A few more trout we beguiled from this shadowy bank, but as we cast we saw several large fish breaking in a deep pool above us. A blind stream entered the river from the left at this spot under grass and weeds, and the circular basin it formed must have been one hundred feet across. As the day brightened the trout were jumping here every moment, and as we took our places at the far end of the pool a scene of awe fell upon me as the big fish lunged up to the surface and disappeared again as if in play, for nothing could be seen on the surface of the water to attract them.

We cast from opposite directions so that our flies nearly met in the centre of a circle. In an instant we had each hooked a fish, and our canoe men softly drew the canoes back so that the struggles of the fish might not disturb the pool, and when the fish was captured the canoe again advanced to its original place. Thus fishing each fisherman saw every cast the other made, and every fish taken. Sometimes the fish would rise to the surface with a roll that showed his head and shoulders, but oftener and particularly as the day grew brighter he would take the fly under water. It is a peculiarity of these fish in the deep waters that they rise as a salmon does to a deeply submerged fly, and the best indication that they were about to cease feeding was their taking the fly a foot or two under water.

At last the sun came out strong and warm, and the pool that whilom was so dark became almost transparent. The trout became more wary, they rose more and more daintly and at last suddenly ceased altogether, nor could any skill allure another. We counted thirty-one; we weighed them and they averaged just two pounds. Looking at our watches we found it was nine o'clock, and we reeled up our lines and leaning back in the canoes paddled back to camp.

It is no Gulliver's tale we tell to-day sitting by the lamp light in our library. Many years of fishing in many lands have taken away the exaggeration of feeling that accompanies a novelty. It is the actual record of three hours work, and if the kindly friend who fished so well beside me and who is now whipping the streams that tumble down the Pyrenees, was home again, as Heaven guide him soon to be, I'd ask him to sign this record to prove that I do not lie. But no pleasanter scene of river sport ever comes up to my dreaming eyes than Misery river on that misty morning.

Al then, farewell, dear coquet-side!
Aye gaily may thou rin,
An' lead me waters sparkling on,
An' dash frae linn to linn;
Blythe be the music o' thy stream
An' banks through after days,
An' blythe be every fisher's heart
Shall ever tread thy Braes.

Let me not forget to do an act of justice to Judson & Brothers of Rochester. I fished for a month with one of their rods, a simple plain stick it was, costing I think twelve dollars when it was new; several years of rough travel and hard usage had made it plainer still. I killed on an average a dozen trout a day with it from half a pound to four pounds, and it came out of the woods as straight

and elastic as it went in. I fished in that time alongside of rods made by every American maker, some costing five times as much; none were better, most of them failed in some particular before the fishing was over.

I never saw Judson & Bro's., and owe them nothing, save this praise, they make an honest gad.

CHAS. E. WHITEHEAD.

Rational Pastimes.

Will our University correspondents kindly send us their most recent catalogues.

—The officers of the Boston Cricket Club are maturing plans for making the season of 1874 more active than any of late years. They have opened correspondence with Mr. Samuel Shaw, of Nottingham, England, one of the noted bowlers of that family, with a view of securing his services as a professional.

—The Boston and Athletic Base Ball Clubs, under the direction of Mr. Spalding, who is now in England, are making arrangements for a series of games in London and the Provinces. Mr. Spalding has been received on every hand with great encouragement, and visited, in company with Mr. Fitzgerald, the Secretary of the world renowned Marylebone Cricket Club and Mr. Alcock, Secretary of the Amateur Athletic Club, the principal cricket grounds near London. The programme of the international matches will be arranged something like the following:—A base ball match August 1st or 3d on the "Lords' Grounds," between the two American clubs, to be followed by two or three more in the same week on other London grounds. After this, cricket matches, American twenty-two against English eleven, and at base ball English nine, (with an American pitcher,) against an American nine, the former having the advantage of six out to an inning. Perhaps cricket may be played in the forenoon and base ball at 4 o'clock in the afternoon, completing the cricket match the next forenoon, and again closing with base ball.

—The subscriptions for the Hartford Base Ball Club have reached the desired amount. The Club will be formed and the following players have been engaged for the season:—S. Hastings, last year of the Baltimores, catcher; Fisher, Athletics, pitcher; Mills, Baltimores, first base; Addy, Bostons, second base; Warren, Nationals of Washington, third base; Tipper, Mansfields of Middletown, left field; Stearns, Olympics of Washington, centre field; Pike, Baltimores, right field. The stockholders meet Tuesday to choose directors. Benjamin E. Douglass, Jr., of Middletown, will probably be traveling manager. The subscriptions reach \$5,300. Douglass subscribed \$600.

—So far six cities will have professional clubs in the field, viz.: New York, Boston, Philadelphia, Chicago, Brooklyn, and Hartford, Conn. The Baltimore Club as such has broken up, and most of the players have gone to Chicago. The prices paid by Chicago are the highest, and are as follows:—Malone, captain and catcher, \$2,200; Zettlein, pitcher, \$2,000; Devlin, first base, \$1,000; Wood, second base, \$2,000; Meyere, third base, \$1,200; Force, short stop, \$1,500; Cuthbert, left field, \$1,500; Treacy, centre field, \$1,200; Glenn, right field, \$1,000; Hines and Pinkham, substitutes, \$1,000 each; McGeary, \$1,500. Total, \$17,100.

—The Boston Club, eleven players, costs \$14,200, the highest price being paid to George Wright, short stop, \$1,800; H. Wright, captain, has \$1,500, as does Spaulding, the pitcher, while McVey, catcher, receives \$1,300.

—The Athletic, of Philadelphia, books eleven players at \$12,200, McBride, captain, receiving \$1,500. The other players are as follows:—Clapp, c.; Battin, s. s.; McMullen, l. f.; Murnan, c. f.; Fisler, r. f.; Sensitive and Reach, substitutes, \$1,000. Anson, 1st b.; Fisler, 2d; and Sutton, 3d, \$1,200 each.

—The Philadelphias, of Philadelphia, have twelve players at \$11,000. Cummins, the pitcher, receives \$1,500. Craver will be captain and Bechtel right field, each receiving \$1,200.

—A curling match took place on Friday last in Patterson between the Paterson Curling Club and the St. Andrew's, of New York. The Paterson men were beaten by six shots. Abraham Collier, a member of the Paterson Club, while making a short cut to the shore, fell into the water and narrowly escaped being drowned.

—The New York *Sun* has discovered a man, an ex-dry goods clerk, who makes a very fair livelihood by feeding at early morning the plump and comfortable cats that belong to the stores of the down-town merchants. He has over a hundred on his list, and is negotiating for a horse and wagon to carry his feed around.

—Our sensitive Boston correspondent, Mr. Chas. E. Pierce, wishes it distinctly understood that he is not a member of the Massachusetts Legislature, although some vagary of the types on page 28 of last issue represented him as introducing a sumptuary measure to the notice of that body.

—The annual exhibition of the New Hampshire State Poultry Association opened at Manchester on the 24th inst., to continue three days. Between four and five hundred cages are displayed.

There will be a similar "hen convention" held at Salem, Mass., the first week in March.

—Perseverance isn't always rewarded. In Indiana lately twenty men handled thirty-five cords of wood to get at a rabbit, which escaped after all.

For Forest and Stream.

A QUEER STORY.

[FROM THE GERMAN.]

BY E. C. G.

As once I wandered thro' the sunny dell,
I saw so queer a thing, which I will tell:
I met a hunter near the forest lake,
He rode now fast, now slow, yet wide awake.
The sportive deer were grazing by his side,
Why shot he not, this hunter in his ride?
His bugle rang thro' all the sombre dell—
Now say, what did his merry blast foretell?

But as I wandered further o'er the lea,
Another queerer thing I there did see:
A maiden in a dainty little frock,
So idly in her fisher-boat did rock,
While far below the sportive fishes played,
Not one did fear the dreamy little maid!
Her voice in sweetest song did rise and swell—
Now say, what did her happy lay foretell?

But as I homeward crossed the darksome wold,
The queerest sight of all it did unfold!
A lovely steed did thro' the forest stray,
While on the lake an empty boat did sway,
And as I came anear the branching oak,
I heard two voices which the silence broke;
But whose they were, I did not wait to see!
And what they said? It can be nought to thee!

For Forest and Stream.

SMOKE.

A POST-PRANDIAL POEM.

WHEN you're weary,
Night or day,
Smoke a cheery
Yard of clay;
When I'm smoking,
Musing, joking,
There is no king
Half so gay.

Lying lazy
Far from crowds,
Weaving hazy
Mental shrouds.
Watching furling
Smoke upwhirling,
Softly curling
To the clouds.

Minds are lifted
From mere mirth,
Thoughts then sifted
Have more worth;
I am thinking,
As the shrinking
Sunset sinking
Fires the earth,

Thoughts that sages
May have had
In their pages,
Grave and glad;
Thoughts thus seething,
Like smoke wreathing,
Sadness breathing,
Makes me sad.

Cigar ended—
Twilight broke:
Night descended,
Thus I spoke:
All that's jolly,
Wisdom, folly,
Melancholy,
End in smoke.

Lotos Club.

SKETCHES IN FLORIDA.

THE BIRDS OF ST. AUGUSTINE.

THIS is a lovely day. The sun is bright and the air balmy—neither too warm nor too cool. I am writing by the open window. Everything is as still as if it were the Sabbath. Far out in the Bay is a boat, in which sits a man, lazily fishing. A querulous crow flies by, hoarsely croaking, and the white wing of a gull gleams distantly in the sunlight. The old flag is gently floating in the soft south wind. The sky is blue, the waves are bright and glancing, and a general sense of laziness seems to pervade the air, and one feels like leaning on the sill and gazing out on the quiet beauty of the scene forever. In the distance, above the belt of dark-green trees, is the lighthouse, with its pure white tower pointing heavenward, like a tall church spire, and its blessed star of hope on the summit. Right below it and cresting the sand hills of Anastasia Island, is the long line of evergreen, with an occasional palm-tree, whose feathery fronds wave above the general mass of foliage, the very emblem of grace. To the south are the storehouses and buildings for the workmen engaged in erecting the new lighthouse, which, when completed, will stand one hundred and eighty feet above the water, with a light of the first order visible twenty-eight miles at sea. To the north extend the long line of breakers with their white capped crests surging over the bar. Further north yet, the snow-white sand of the beach and the interminable line of verdureless "dunes" glisten in the sun. Nearer are the wide marshes, so infested with rattlesnakes that cattle cannot graze there. Here and there a few clumps of scrub relieve the brownish yellow of the marsh. Nearer yet is the Bay, shimmering in the sun. On the shore, near the sea-wall, the tide is down. A little grey-coated sand piper comes tripping along the beach "peeking" softly to itself, as if it enjoyed the sun, and perches upon a warm stone dressing its feathers. Then comes the sea-wall—a monument of governmental patronage and the favorite Sabbath evening promenade of Minorca's dark-eyed beauties. At its terminus, far to the north, loom up the massive towers and frowning battlements of Fort San

Marco, the pride of "the ancient city." How peaceful the scene, for peaceful looking it is, notwithstanding the old fort glooms in the distance with racks full of great cannon balls and field pieces on the parade in the foreground. The day was so lovely that, having a few hours' leisure, I thought I would go and see "the birds," so I called on the Colonel, who is a capital sailor, and finding him disengaged, we started in his skiff, (y'clept by the jokers "the Snorting Sea horse,") and sailed up the Bay about a mile beyond the town, passing the old Fort and running in among the bayous which intersect the wide marshes.

Have you ever heard of the birds? I copy a slip from the St. Augustine Press which will explain the matter:—

"We witnessed a novel and beautiful sight a few days ago at the farm of Mrs. H., situated on the North River, about two miles above the city. Mrs. H., in the course of a few months, has succeeded in taming the wild birds that fly about the place. While we were in the house Mrs. H. went out to the door and called to the birds, which were then, in the middle of the day, in the adjoining forest. In a few moments a dozen or more blue birds and mocking birds came flying around her. She then came into the house and handed each of our party a raisin, which we were requested to hold out in our fingers. We remained still for a few minutes, when the birds hopped in at the door, flew upon our hands, and picked the raisins from our fingers. We were astonished and could not help wondering the more when we were informed that none of these birds had been caged, but were thus tamed by the gentleness and art of this lady."

As it may interest some of your readers, and conduce, perhaps, to both pleasure and profit, and aid the cause of the feathered tribes by inducing some of our gentle and fair friends to aid in their civilization and domestication, I will give the result of my trip, which will show the power of continued gentleness and kindness with these beautiful denizens of our woods.

After a pleasant drive of a mile or two, over sandy roads and through a thick chapparal, we arrived at the little farm but found its occupants absent, so we missed seeing the birds, which, as it afterwards turned out, would have been the case even had Mrs. H. been at home, for her feathered visitors were of those varieties which migrate from the north and had not yet returned. We were driving back, a good deal disappointed, when on the road we met the old lady and her son, so we stopped and held some pleasant talk. I told her I had a dear friend in the distant north who had read of her birds with interest and was anxious to know how she tamed them. I added that my friend loved the birds but could not succeed in winning them in their wild state to feed from the hand as she had done. Mrs. H. seemed much pleased at this and smilingly began to tell me how it had been brought about. She is a placid looking old lady about sixty-five, but young and active for her years. She and her son, a young man of twenty-five, had bought a tract of land about two miles north of this city, (St. Augustine,) put up a shingle house, and there they lived. They are farmers, sell berries, corn, potatoes, poultry, etc., and thus obtain a comfortable livelihood. Their house is on the edge of a bayou leading to the North River, just between the marshes and the woods on comparatively high ground, a pretty site with a fine outlook towards the sea. They were very lonely there, however, no near neighbors but few passers by.

"It all came of my being so lonely," said Mrs. H., and I give her own words as nearly as I remember—"for the sake of company I began to make friends with the birds, though the beginning of our friendship was rather accidental, too. I always threw out the crumbs from the table, and as I did so I noticed a great many birds would come and pick them up. They were so pretty and trusting, I thought it would be a pleasant thing to have them round me, so I determined to make a regular habit of feeding them every day, and I began to throw my crumbs and handfuls of grain far from the house towards the grove, each day a little nearer and nearer 'til I got them right 'round the door. All this time I was very careful not to frighten my little friends. I had no children about the house, and did not keep either a dog or cat, so the quiet could not be broken—there was nothing to alarm or startle, and the birds soon became fearless. Then," she added, "my son noticed what I was doing and joined me, and by degrees, the birds learned to know him and trust him as they did me. After they had been feeding 'round the door for some time, I put some of the crumbs in my hand and held it perfectly still. Then they hopped up and began to eat from my fingers. I knew I had their hearts then. Finding I never tried to catch them they came into the house, twittered about and fed without fear. I now began to call them, and as the little creatures knew this meant food, (for I never disappointed them,) they learned to know my voice and came readily at my call."

Mrs. H. informed me that this continued for some time, when strangers heard of it, and began to drive out to see her pets, perfect quiet was enjoined, and the touching or catching of any bird was carefully prohibited. The little creatures were perfectly fearless, coming at her call, no matter who was there, and fluttering and twittering about her. Many people had been there and seen it, and, said she, "I have received many letters inquiring my method of so completely taming wild wood birds, but there is nothing about it, no charm, only kindness and perfect freedom from harm or annoyance." The birds went north in the spring, and this had been the first year Mrs. H. tried feeding them, and accident and loneliness had brought about this pleasant friendship. "I do hope it won't be broken off," she added earnestly, "I want the birds to come back. I have learned to love them, so I could not bear them to forget me."

Such was her story. I assured her that many, if not all

her birds would return, and very likely bring their little ones with them, that such were their habits, and if my friend came to this land of flowers, we would be sure to remember and come to see both herself and her birds. I must not forget to add that I asked her what kind of birds were her guests. "I can hardly tell you," she said, "there are so many that I do not know; but I see plenty of mocking birds amongst them, blue jays, blue birds, robins, and little brown birds, which are very sociable." By these last I recognized the friendly little sparrows so familiar to us at home. She also told me they expected to build a new house, and she wondered if the birds would consider that a safe home and come there too.

So we parted, she to her lonely home and we to the barracks. But the memory of that scene returns pleasantly to me—the quiet road-side shaded by the tall Florida pines—the rough-cast and shaggy horse—and the gentle old lady sitting among her baskets with her son by her side. I seem to see now her face lit up and shining with sweetness and peacefulness as she talked of her pets. That countenance, radiant with the beauty of a severe kindly spirit—that gentle voice I vividly recall; and as I do so, I do not wonder that the very birds of the air learned to trust and love her. For all this told a story that even they could not fail to read.

But I have not taken my friend there yet, nor do I know whether the hope of the good old lady has ever been realized, and her friends (the birds,) returned to brighten and cheer her declining years, and meet their kindly welcome. Long before I shall be able in this everchanging army life to revisit "the ancient city," the old lady will doubtless have gone to her rest. May the birds, as in the sweet nursery tradition of "the Babes in the Woods," hover over her grave and lovingly scatter leaves above her peaceful breast.

MONMOUTH.

THE GAME OF NORTH CAROLINA.

EDITOR FOREST AND STREAM:—

I PRESUME no State in the Union possesses the facilities for enjoyment, in the way of fishing and gunning, &c., that the old North State does. From early autumn until spring, her inland waters, the Albemarle, Pimlico and Currituck Sounds, as well as the Neuse, Roanoke, Chowan, Tar, and Cape Fear Rivers are covered with countless thousands of swan, geese, duck, brant, &c., while along the Neuse River (and I speak particularly of this river from the fact that I live in New Bern upon it, and know the country) can be found thousands of deer.

To use the expression of an old hunter down the river, "there is a deer for every acre of land." Back a few miles the bears are so plentiful, that they have become a serious annoyance to the planters, the young pigs being picked up to a certainty if they stray into the pocosins late in the evening, and the corn fields on their borders possess peculiar attractions for bruin.

As to fish, well hold your breath, we catch more millions of all kinds, than you in some of your Eastern States do thousands. Trolling for blue fish, the "temnodon saltator" is the sport in Beaufort Harbor during the months of September, October and November.

With one boat and four lines, two years ago, I myself with three other gentlemen caught 493 fine fellows, in about five hours. I think it the most exciting sport in the world, with a fast sailing clinker built sloop-rigged open boat, sailing back and forth in the inlet just on the edge of the breakers, with the ravenous blue fish snapping at your spoon, sometimes taking it before it fairly touches the water, with three other jolly fellows, all pulling for dear life to beat your score, every fellow with a six pounder almost certainly, and at times to have ten to twelve pounds of animated fish fast hold of your hook, making your muscles crack to pull him in, all constitutes what to my mind is the "ne plus ultra" of sport.

I have known three ladies and one gentleman to take with hook and line 290 trout and drum in less than three hours, while fishing in this Harbor, their boat anchored in one spot, near the railroad wharf. Sixteen miles below New Bern and five miles south west of the Atlantic and North Carolina railroad, is a chain of four lakes, or rather the beds of what were lakes (as they have been pretty thoroughly drained), the largest of which, Lake Ellis, is about five miles across in every direction, while the others are somewhat smaller. These lakes are the resort of thousands of wild geese and black ducks, very few of any other kind being found there.

A few weeks ago I determined to pay them a visit, so sending my yacht Julia around to Slocum's Creek, which runs up very near the railroad, and receives the waters from these lakes, through an artificial canal some six or seven miles long, we took the cars for Havelock station, the nearest point to Lake Ellis, which we reached about 2 P. M. The Station Agent had secured the services of "Sparks" a genuine North Carolina collard stuffer, together with his cart and critter, for the transportation of ourselves and traps. Sparks is a case. I don't think he could possibly speak without cursing. He swore at, and about everything. The bars were his particular objective point, ever since he got treed by one. Wild cats (by the way there are plenty around the lakes) came in for a generous share of his attention. But my breech-loading gun was a little too much for Sparks. He noticed something peculiar about it, and asked to be allowed to examine it. As I passed the gun to his hands, I pressed the lever, and as it touched his palm, the gun to his eyes broke in the middle. Astonishment was depicted upon every feature of his face, while his

language deserves a place in "the archives of gravity," as one of our colored members of the Legislature said in 1868. But Sparks could shoot, and had a splendid pair of barrels.

Of course we had to go bear hunting, and we were placed upon stands, along the banks of a large canal, where the tracks and droppings of very large bears were as plenty as I have seen of hogs where a corn field was given them for feeding ground. We were all green at the business, except Sparks, and it caused a very curious sensation to run along the spinal column, as we crouched in the grass after dark waiting for bruin to put in an appearance, when a jack ass a little distance above us commenced to break off the corn, the sharp crackling of which caused all to suppose one of the black rascals had crossed the canal without our seeing him. We were not scared, oh no! but I guess one of the boys wanted to go home. The wind blew freshly from us upon the pocosin, and bruin's scent warned him of danger, and he didn't come.

But my communication has reached far beyond the limits I proposed, when I sat down to simply to tell your numerous readers the fine sport to be had around New Bern. Around Norfolk, and down in Currituck Sound thousands of persons are during the whole winter engaged in hunting, while with us, being farther inland the game is not disturbed except by our own people. Our game laws are very loosely drawn and are a dead letter upon the Statute Book. The best of guides can be procured for one dollar per day and rations, and almost every man in the country owns one or more hounds.

The officers of the Revenue Cutter Stephens went ashore at the mouth of Bay River (near the mouth of the Neuse) two weeks ago and started seven fine deer within three hours. Mr. Editor, I find I didn't tell anything about how we shot geese and black ducks in Lake Ellis, but I guess it will keep, so more anon. J. E. W.

Woodland, Lawn and Garden.

PARLOR OR WINDOW GARDENING.

NO. VIII.—SUB-TROPICAL AND FERNS.

"The wet leaves, the morning air
Are stirring at its touch, and birds are singing
As if to breathe were music; and the grass
Sends up its modest odor with the dew,
Like the small tribute of humility.
Lovely, indeed, is morning! I have drunk
Its fragrance and its freshness, and have felt
Its delicate touch; and 'tis a kindlier thing
Than music, or a feast of medicine." N. P. WILLIS.

IN our last paper upon the science and *modus operandi* of window gardening we promised our readers a few words upon the more difficult division of the art of window gardening, called the sub-tropical, with the introduction of aquaria, etc.

We naturally suppose that all who would try their taste and ability to make a pretty combination of different kinds of flowers of varied foliage and colors would have in the first instance a place of sufficient capacity to lay a good foundation for the same. In order to well develop all the beauties of such a window as we here describe, and which has given us much pleasure and many hours of study, one whole bay window of largest dimensions will be found none too large for our purpose.

In the first place, you will have a neatly made box of such shape as will fit snugly to your window recess. This is to be placed upon good strong rollers, so that it may be drawn out into the room if desirable. The front of this box may be made of panels, and ornamented to suit the taste of the lady of the house. Very tasty, and even beautiful, cabinets can be made with little effort on the part of the originator, and they are always beautiful either in summer or winter. Your box may be made of such depth as your window will admit, taking care not to have it more than three feet from the bottom of the parlor floor. In this box, if you design to unite the sub-tropical style with the fernery, or Wardian style of culture and plants, it will be necessary to fix a zinc box, as before noticed, from which a small lead pipe—size, quarter of an inch—should pass through the wooden box, with a small stop-cock attached, to draw off superfluous water.

This is your *necessary* preparation. You will now fill to the depth of one foot from the bottom of your box with goodly sized pieces of crock and bits of brick, etc., for the purpose of giving a good drainage. Upon this you are to place your soil for the reception of plants. You can, if you desire, throw an arch from each corner of your box, meeting in the centre, or a small rocky arch made of scoria, bits of melted iron, and flinty substances found near blast furnaces in any quantities; small iron rods may be used as supports for the scoria, and these can be bent in any shape. Then the scoria is to be compacted around these rods, broadest at the base, using from the bottom of the box, and wired with small wires to the supporting iron rods above named; hydraulic cement may be used to unite together these bits of scoria, and as they are irregularly shaped and full of smoke holes they are well adapted to the use for which you now use them. In these crevices formed by the scoria you can place bits of quartz and small specimens of minerals that you value, and if you unite with your sub-tropical plants the aquarium you will find a very pretty effect will be produced. The scoria are then to be painted of a stone color, or ornamented to imitate rock work. This portion of the work, when well done, is

one half of the whole undertaking, and hence we remark, if you cannot afford the time and study to do this you had better not attempt to do it at all. In making these column arches, as we call them, you can make little spaces for the reception of earth all along these arches (they will be, if made right, six inches in diameter and quite strong) to hold mosses, lichens, and other water or humid plants. You can run a shelf six inches wide some three inches below the top of your box, upon which you can place on the edge next the inside of the box bits of scoria as large as your fist; these will support the peat, earth, and composition made of rotted mosses, etc., for supporting ferns and fern-like plants. Now below this shelf—one foot below it will be sufficient—you can place a second shelf, running like the first all around the box, and fourteen inches in width. This is to be edged like the other with pieces of scoria, twice as large as on the first shelf. This running flower box is to be filled like the first one, with peaty soil, two parts peaty composition to one of sand.

You now have your boxes ready to fill up to within three or four inches, or even two inches of the lower shelf, with your prepared soils. In order to have a good combination of plants you must have a good foundation; if for a sub-tropical arrangement (always a delicate and somewhat difficult arrangement) your principal source of difficulty will be found in too much moisture and not too little. You should bear in mind this fact—look to your parlor garden, if a sub-tropical one, every day.

Your box, being now, as we will suppose, filled with the necessary soils, you can begin planting the same, and you will plant the outer small box—which runs all around the box—with the plants best adapted to such situations. Among these you can use the following:—Begin with the fern tribe—by many considered to be a remnant of the vegetation of a past age, or rather era, and the very peculiar treatment they receive would seem to confirm this view. Most of the ferns delight in a loose soil and abundant moisture, with a warm, humid atmosphere. Many kinds are quite hardy, and readily adapt themselves to their new homes. Of the kinds of ferns to be used, we may name our own native ferns of the meadows and woods. All, under a high state of cultivation, are a study of themselves, and some very beautiful in their first development.

Many of the English, as well as American ferns, grow very finely, and under a good state of cultivation are sometimes scarcely known as our old familiar friends of the woods, so much has good, careful culture changed them. There is no more stately and beautiful fern than the *Dicksonia*, or tree fern; though growing quite large, they can be used to advantage, and are a splendid addition to a sub-tropical window garden. We have planted this fern in a large box, and placed it near one corner of the room, and it was a grateful addition to the parlor or sitting room.

To return, again, to our sub-tropical window garden, we find many fine specimens among the ferns. One of short stature, called the "low growth" ferns, are well adapted for this decorative use, and after a little time and observation the study of the spores or seeds found beneath the leaves of many of the ferns are an object of much interest to the inquiring mind. These fern spores, as seen through an improved microscope, are a wonderful revelation of the hidden mysteries of the vegetable or flower world. Wonderful, indeed, are the revealed minute atoms beneath the object glass of this instrument.

As an accompaniment, or companion of the ferns—very pleasant to look upon and easily cultivated, is the creeping species of *Lysimachia nummularia*, called moneywort from the rounded form of its leaves. This plant will hang in long and graceful stems, its deep green leaves and small, bright yellow flowers sparkling like gems amid the pearly drops of water around the fountain and rockery out of doors, or the miniature rocks of the sub-tropical garden within the bay window of our parlors. These fine flowers, though wild, are much improved by cultivation, and when used side by side with lilae, or reddish purple, have a fine effect. There are various river side plants, and a walk beside almost any of our summer brooklets will reveal this quiet little plant in its festive loveliness.

Another well known plant, so common that every boy we'll know it, is nevertheless admirably adapted to our use in this window association of plants. We refer to the *Sempervivum tectorum*, or common houseleek, which covers the roofs of our old houses with its rosettes of living green foliage; its large clusters of juicy, pinkish flowers are beautiful indeed. This plant is tenacious of life, is easily cultivated, and placed within the crevices of our arch of scoria is beautiful when it forms a rosette from which depends in graceful festoons the moneywort before mentioned.

As you will find it necessary to cover your peaty earth with some of the fine growing mosses, many kinds of which you will find vigorous and full of life in any greenhouse, I need not specify by name any particular one, leaving you to make your own choice to suit your own fancy, and we will next name as a fitting plant, and one that will grow well in your outer box shelf, rising up from the green moss, bright and full of fragrance when in blossom, the *Viola palustris*, always found growing among the mosses, much in its habits like our wood violet, so much prized in spring time, and having something of its pleasant odor. It is of a pale lilac color, and looks well in the place you have assigned it. While you are out in the woodland swamp in

search of the violet you may look about you and see if you cannot find a sweet little flower, quite common in our woods, and found often in damp grasses. We refer to the *Campanula hederacea*. It is the smallest of the bell-shaped flower tribe. A honey bee could not hide its head in its flower, so tiny is its perfect blossom. The leaf is ivy shaped, and when in blossom in favorite conditions its purplish blue flowers are a compensation for all our care in its cultivation. You will find it quite easily in its favorite haunts, and having found it pass your transplanting trowel well under it, taking up a generous share of the soil, and carry it to your garden, where it will grow and thrive until such time as you are ready to place it within your window garden. In this place, which we will call the place of the ferns, we would state that in our usage of the ferns, whether in fern cases (of which we shall hereafter speak) or in the window, it is best always to choose those of very dwarf and compact habits. This will allow for a little drawing up of the ponds from confinement. Of course you will not forget the formula before given (a mixture of loam, leaf mould, and sand to grow them in), to which you may add a few bits of charcoal as large as walnuts. Ferns thus set out will absorb all the moisture they require; they can now, and will, take care of themselves. They will hold a supply of moisture without stagnating, but should you observe that the water remains unabsorbed you are now only to turn the little stop-cock before mentioned and your superfluous water is easily removed. One other matter in this connection is particularly necessary to be observed, and just in this place you will notice its adaptedness to success. Near the edge of your window sash, about the middle of the second pane, bore a half inch hole through with a clean cutting bit, and into this hole fit a piece of half inch lead pipe of about a foot to fourteen inches in length, both ends of which are open. This is your ventilator, and your cork, of which only one is necessary upon the inside within your bay window, will give you all the ventilation you need.

This will be found of great value to the beauty and brilliancy of your plants if you have, as many do, glass doors opening into your parlor from your bay window. If you would have a complete success in a tropical garden like the one I am now describing, you will have a sort of standing ease, made of sufficient size to cover your inner space of the window, separating completely the garden from the parlor or room within which you grow your plants. Let the sides of the casing to the window have (in other words a bay window case) one pane, or one foot deep at each side, and front whole, with the exception of one or two panes like a door, on hinges in the center, and you are ready to grow the most delicate plants.

We shall further continue our description in our next paper, and will, with your attention to the necessary details, help you to finish your sub-tropical window garden.

OLLIPOD QUILL.

—The *Homeward Mail*, an Indian journal, contains some interesting facts in regard to the destruction of the forests in Hindostan, and from a very thorough article on this subject we make the following brief abstract. The *Homeward Mail* states that no country has suffered to an equal extent from the destruction of forests as India. In Europe the regrowth of trees is quite possible, but in India the effects of climate prevent it. It is evident that climatic differences already exist in Hindostan. Some three centuries ago the Indian Peninsula was covered with forests, and lakes, marshes, and water sources were numerous; to-day but few exist. Rain fell there some hundred years ago on the surface of the ground, and was retained, evaporation being diminished; rivers ran full through their banks, and grasses and plants were nourished. To-day all this has changed. Lakes, morasses, and small streams no longer have any existence. Even the rainfall has diminished, and general aridity of soil is slowly but certainly following the disappearance of the forests. Some people may say, "We have cut down the woods, but they will grow again." Those who express themselves in this guise have no idea of the difficulties in the way. It may be possible that during the rainy season the weather is more or less favorable to the growth of young plantations of trees, but during eight months of the year the dryness of the climate is such, and the ground is so baked, that even should the trees have taken root in the wet weather they are swept away by the rains, or killed in the subsequent hot months. Numerous trials have been made to restore the forests in certain localities, but without success. The measures taken have been too long delayed, and the *Homeward Mail* concludes by asserting that the task of replanting the forests of India is impossible.

OBITUARY.—Robert K. Potter, Esq., of the firm of Wright & Potter (Massachusetts) State Printers, who died in Boston Wednesday, the 5th inst., at the age of fifty-eight, after a nine weeks' illness with pneumonia, was one of the pioneers among Boston men to explore the Adirondaeks, making many annual excursions in company with Hon. Frank W. Bird, long before they became popular as a place of summer resort, and their attractions only realized by like genuine sportsmen. He wrote a very interesting lecture on this subject, and often delivered the same before large and appreciative audiences, doubtless planting the seeds in many a young mind which ripening added many to the grand army of sportsmen who love to forget the cares of business and recruit their health in pursuit of the pleasures and enjoyments afforded by the forest and stream.

Natural History.

THE GLANDULAR SYSTEM ON THE HIND LEG OF THE CERVIDÆ AS DESIGNATING SPECIES.

BY J. D. CATON, LL.D.

TO CHARLES HALLOCK—Dear Sir:—I take pleasure in answering your inquiries in reference to the glands found on the hind legs of the deer. But first, I must thank you for an acquaintance with Dr. Gilpin and Mr. Morrow, and through them with other gentlemen of Halifax, who have rendered me great assistance in the study of this subject.

As early as 1836 Dr. Gray made some observations to the Zoological Society of London "on the tufts of hair observed on the posterior legs of animals of the genus *cervus* as characteristics of that group, and a means of subdividing it into natural sections.

Notwithstanding this early suggestion, even Dr. Gray himself seems not to have appreciated the importance of the subject, for he never afterwards used these tufts of hair as a means of distinguishing the species of the genus, so far as I am informed; and when in his specific descriptions he has referred to them there is noticeable a want of that care which is usually observed in his writings on natural history. Indeed, I do not find that he ever afterwards alludes to the subject in the light of his first suggestion. He never explains to us their significance or their peculiarities as found on the different species.

Some years since my attention was attracted to these tufts of hair found on the four different species then in my grounds, our elk or wapiti (*Canadensis*), the mule deer (*macrotis*) of the Rocky Mountains, the Columbia black tailed deer (*Columbianus*) of the Pacific coast, and the common, or Virginia deer, (*C. Virginianus*). I observed that they were exactly alike in location, size, form, and coloring on every individual of each species, and entirely unlike those on each of the other species, so that an inspection of the pieces of skin containing these tufts of hair would enable one with absolute certainty to declare the species to which it belonged. This led me to a closer study of these tufts of hair and what they covered. A dissection of the parts, with microscopical examinations, disclosed that they covered cutaneous glands, those on the outside of the hind legs being more perfectly organized and more active than those on the inside of the hock. The former have long been recognized and named *metatarsal glands*. The latter I have called, for the purpose of distinction, *dermal glands*. I have not space to give more than a general, superficial description of them.

On the wapiti deer the metatarsal gland is situated on the outside of the hind leg near the back edge, and just below the up end of the metatarsus is entirely covered with long white hairs, which curve forward as if to embrace the leg, so far as their length will permit. These long white hairs covering the glands are surrounded by a band of short cinnamon colored hairs about half an inch wide, and below the gland a stripe of the same colored hairs three fourths of an inch wide extend down the posterior edge of the leg to the foot. A correct description of one is an exact description of all in the herd, both male and female, varying only in extent according to the size of the animal. On this species, and on this species alone, the dermal gland is entirely wanting, there being no vestige of the gland or tuft of hair on the inside of the hock on our elk. This fact was first noticed by Professor Baird, but he mentions it with doubt and hesitancy, from the exceptional characteristic and the limited number of specimens he had to examine.

The metatarsal gland on the mule deer commences just below the upper articulation of the cannon bone, is on the outside and near the back edge of the hind leg, is covered with a black horny scale, which is a condensed secretion from the gland, and may be peeled off without much violence, showing the soft rose colored skin beneath, pierced by innumerable canals from the gland beneath the cuticle. This naked part over the gland is six inches long and half an inch wide on the fully adult male, and is diminished in size in proportion to the size of the animal, whether male or female. This gland is surrounded and overlapped by a tuft of long hairs of the same color as on the balance of the leg, not a white hair appearing among them. The dermal gland is present on the inside of the hock covered by a tuft of long raised hairs, disposed in a descending direction. This tuft is pear shaped, with the smaller portion above, is two and one half inches long and one and one half inches broad at the lower end, and is of a lighter shade than the surrounding hairs.

On the black tailed deer the metatarsal gland commences a little lower down than on the mule deer, is half the length and width of that on the mule deer, but in other respects the general description is the same. The dermal gland is appreciably smaller, but in other respects bears the same general description as that on the mule deer.

On the common deer the metatarsal gland commences at the middle of the leg near the posterior edge. The naked portion extends downward five eighths of an inch, and is three sixteenths of an inch broad. This is surrounded by a tuft of long reversed white hairs, which again is surrounded by a very delicate border of tawny hairs shorter than the white but longer than those of the higher shade beyond. This tawny border is wanting in the variety found in the far west and north, known as the white tailed deer, or long tailed deer, and by naturalists described as a

doubtful species, *C. lucurus*. A careful study and comparison show this to be identical with our common deer, the only observable difference being the absence of this small colored band, and generally the animal being of a lighter color, the white regions being more extensive.

The small deer found in Texas and Mexico, and hitherto designated *C. Mexicanus*, upon a careful examination is also found to be but a variety of our common deer, differing in no respects from those found in the eastern States, except that they are smaller in size.

The dermal gland on the Virginia deer is also covered entirely with a tuft of white hairs, varying not much in relative size, and similarly disposed as on the others described.

I have in my grounds a very small species of deer, brought from southwestern Mexico (Acapulco), which more nearly answers to *C. purcheran* than any other described species, and yet is not well described as such, and may possibly prove to be an undescribed species. On this new species the metatarsal gland is entirely wanting, nor is there the least appearance of a tuft of hair on the outside of the hind leg. The dermal gland, however, is present, covered with a tuft of hair similar to that on the Virginia deer, except that it is not white.

I also have another species of deer from Ceylon, resembling much the deer from Acapulco, though larger, on which both glands are present. That on the outside of the leg is situated a little lower down than on the Virginia deer, the naked portion of which is about the size of a barley corn, and is surrounded by a small tuft of white hairs, and it requires a pretty close scrutiny to observe them if the animal is standing twenty feet distant, as the white hairs are partially covered up by long colored hairs.

We will now pass to the larger species of the deer family found on this continent—the moose (*C. alces*), and the caribou, or reindeer (*C. sylvaticus*, var. *Tarandus*). A critical and extended examination proves that the metatarsal gland is entirely wanting on both these species, and it is worthy of remark that this peculiarity is observed on the largest and the smallest of the species inhabiting North America, while this gland is present on all the intermediate species except the caribou, so far as my researches enable me to speak. Of the presence or absence of these glands on the barren ground caribou (*C. Arctica*), I am unable to speak. It has long been a question of doubt whether our moose be identical with the European elk (*C. alces*), and our caribou identical with the European reindeer, (*C. Tarandus*). Dr. Gray in his descriptions of both these European species, tells us that the metatarsal gland is present. He, of all others, should not be mistaken in this regard, and if he is not, then we have a difference established at once, which should go far to show that they should be ranked as different species. But a careful examination of this question I shall reserve for another occasion, after I become better informed as to some important facts bearing upon it, merely remarking here that Dr. Gray himself considered these glands or the tufts of hair covering them as the most reliable *indicia* to distinguish the different species of the *cervidae*, and when we observe how exactly they are alike on every individual of any one species, both male and female, and how very dissimilar they are on the different species, we are quite prepared to agree with him in his conclusion. Still, it is possible that Dr. Gray may have been mistaken in his statement that this metatarsal gland is present in both of the European species which he describes, and I hope yet to obtain additional information on a subject which is assuming great scientific importance.

The dermal gland is present on both the American species referred to, and they maintain their integrity by being exactly alike on every individual in the respective species. On our moose the dermal gland and tuft of hair covering it are very small, not larger than that on the small Acapulco deer. The tuft is black, and pear shaped, but, unlike all the others, it occupies a horizontal position, the small end occupying the anterior position.

On the woodland caribou the dermal gland and tuft of elevated hairs covering it are much larger, as large in proportion as on the smaller species. It nearly corresponds in color with the region around it. Like all the others, it is pear shaped, and it occupies a vertical position, with the small end upwards. In all the hairs are long, are elevated rather than reversed, and always point from the small to ward the large end of the tuft.

In all cases these tufts covering the glands, and the glands themselves, are as near alike as possible in all the individuals of any given species, but they resemble each other in the different species much more than those on the outside of the leg, which, as before remarked, are so very dissimilar as to enable one to distinguish and identify the species by these alone.

Should this paper fall under the observation of any one having the facilities to verify the observations of Dr. Gray upon the European elk and reindeer, who will carefully examine for these glands and the tufts of hair covering them, and especially if those on the outside of the hind leg are actually present, and advise me of the result of such examination, he will lay me under great obligation. Similar information relative to our barren ground caribou would also greatly oblige me.

Ottawa, Illinois, February, 1874.

ANIMAL AND VEGETABLE LIFE ON THE Isthmus.—In Commander Edward P. Lull's report of the expedition under his command, which has been searching the route for an interoceanic canal through Nicaragua, we find the fol-

lowing in regard to the insects, lizards, etc., of this tropical region:—

Insects, lizards, etc., had been so common from the first that the most of them had ceased to be annoying. Mosquitoes at night, and in the swamps at all times; and by day wasps, hornets, and large flies, particularly a large yellow species, which drew the blood every time it alighted upon the skin. Another of the pests of nearly every camp was the alligator ant, which attains a length of nearly an inch, and whose bite is as painful as the sting of the hornet, and apparently even more poisonous. Among the many favors which had been bestowed upon us by Mr. Runnels and his family, of Virgin Bay, was a present to each officer of a cedren bean, said to be a certain remedy for the bites of poisonous snakes or the sting of tarantulas; fortunately, we never had occasion to test its merits, though there were many narrow escapes. Parasite vines of all sizes and colors, and festooned in every imaginable form, were so common that a snake hanging from a limb of a tree would often be unnoticed by the officers and sailors, though never by the macheteros, who seemed to be on the constant lookout for them. Occasionally one of the former would suddenly feel himself seized and jerked back, and would find that the keen eye and strong arm of one of the natives had rescued him from an enemy that he himself had not seen, though perhaps looking directly toward it and not a yard from it. The officers and men of the expedition, which was divided into several parties of exploration, were all well, though nearly everybody was suffering with innumerable itching sores upon all parts of the person, produced partly by dietetic and possibly by climatic causes, but mainly by the bites and stings of insects, and the poisonings of different vines and plants. Although the region in which the parties were operating contained several estates more or less cultivated, yet by far the greater part of each line was through an unbroken, virgin forest, the rank, tropical vegetation in many places forming a perfect jungle. Occasionally were met large areas filled with the terrible pica-pica, as it is called by the natives. It is a tall bush, loaded with a kind of bean, whose pods are covered with a down consisting of minute barbed needles; they are detached from the bush at the least shake given to it, and alighting upon the person produce perfect torture, seeming to penetrate through the clothing as easily as into the unprotected parts of the skin; the sensation produced is exactly like that of fire. It was sometimes found impossible to cut through the pica-pica at all, and slight deflections of the line were caused by it several times. It is only at certain seasons that the pica-pica is so troublesome, and the expedition experienced it at its worst.

SINGING FISH.—I was a passenger on board a Bombay vessel, cruising about among the Malayan Islands; and the weather being warm, I and my friends spent most of the time on deck. One evening about nine o'clock, as we sat merrily chatting together on the ship's poop, we suddenly heard wild, sweet music, that seemed to rise from the sea, just below our feet.

At first it was only a soft trill, as of a single voice; then a full chorus of voices burst upon our enraptured ears, till the very deck beneath our feet seemed to vibrate and tremble under the influence of its thrilling sweetness. But still we saw nothing, though every eye was peering wistfully out over the waste of waters; and at last we came to the conclusion that it was a trick played on us by our fun-loving captain, perhaps by the aid of ventriloquism. He, however, stoutly denied any agency in the matter, and told us gravely to "keep a close lookout on the lee bow" if we wanted to see a Mermaid. The motion we felt, he assured us was the Mermaid's dance, and their efforts to drag down the ship! After he had enjoyed the joke to his heart's content, he explained to us that both music and motion were caused by singing fish. These, by coming in great numbers, and clinging to the bottom of the ship, had caused the electric vibrations we felt, as well as the sweet music that had so delighted our ears. In proof of his assertion, he produced several *bona fide* specimens of the fish, taken by one of the sailors with a net. Alas! for all the fairy pictures we had been so ingeniously weaving—our much lauded songsters were only little brown fish about six inches long, oval-shaped, awkward looking and ugly—quite unfit to be eaten—apparently of no use to the world but to sing. Upon the wonderful performances of these little fish, I have not the slightest doubt, have been based all our pretty fables of the Mermaid—her beauty, songs and fascinations. I afterward repeatedly heard their serenades, and always with increasing delight; and I still have in my cabinet of oriental curiosities several well preserved specimens of these Singing Fish.—[Bright Side.

THE CANADIAN MARMOT.

ST. JOHN, N. B.

EDITOR FOREST AND STREAM:—

But few persons, I find, seem to know of the existence of this little animal in our Province, at least by name. I know I didn't until I captured one in the country one day, and until I consulted Natural History, which gives a full description of the Marmot. I thought I had only got a woodchuck, which they resemble somewhat in appearance. This is how I captured my specimen, which I kept alive for eight years and a half: It was on the 3d of June, 1865, while on my way to Lock Lomond (16 miles from St. John), in company with some friends for a day's enjoyment. I observed one of these little animals sitting on a log fence alongside the road. My friend J. M. W., getting out of the carriage and creeping softly behind it, dealt it a gentle tap on the nose with the butt-end of the whip handle, just sufficient to stun it and make a capture. I brought it home and had a fine large house made for it. One day, about the middle of October, some three months after I had captured it, I went to its house as usual to feed it. Finding that it did not make its appearance as usual at the bars of the cage to receive its food, I opened the door of the sleeping apartment, and there found it coiled up in the hay like a ball, and sound asleep. Not being able to awaken it, I thought perhaps it was numb with the cold, the weather at this time being raw and fall-like. I brought it into the house and placed it before the fire, and before fifteen minutes it commenced, as I thought, to thaw out, and finally stretched out its fore paws like a dog or cat is seen to do when awaking out of a sound sleep; the thought then struck me that it perhaps was one of the so-called "seven sleepers," so I concluded to put it back in its house and watch the result, and sure enough it soon coiled itself in the hay again, and before long was wrapped in the arms of Morpheus. Its house remained out in the open air all winter, and the Marmot remained in this dormant state, without eating a particle of food, until one day in the month of April it made its appearance at the bars of the cage and ready for a good "square meal." This wonderful freak of nature was continued every year, retiring about the latter part of October, and remaining dormant until the month of April. It was curious to see it, sitting on its haunches like a squirrel, and with its fore paws fill its

month with straw and then carry it in to its sleeping apartment to make its bed, and then coiling itself up in it for a sound six months' sleep. Last month I visited its house, as I used occasionally to do during the winter, and found it dead. Poor Marmot! If I had not had it so long, and if it had not survived many colder winters than this, I might have thought it had frozen to death; but, as Natural History states their lives only average eight or nine years, I am content to think mine lived out its appointed time, and poor "Kip" will not wake when the gentle spring of '74 comes. Thanks to friend Carnall, he has made a good job in stuffing and setting it up for me, and I can now have him (almost alive) winter and summer, a pleasant reminder of our nearly nine years' acquaintance-ship.

WILLIAM M. SEARS.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, {
NEW YORK, February 21, 1874.

Animals received at Central Park Menagerie for the week ending February 20, 1874:

- One small Alligator. Presented by Mr. R. E. Babb.
- Two Gray Squirrels, *Sciurus Carolinensis*. Presented by Mr. Welling-for Holbrook.
- One Civet Cat, *Paradoxurus typus*. Hab. India.
- One Monkey, *Macacus cynomolgus*.

W. A. CONKLIN.

"MAN AND APES."—Mr. St. George Mivart, in this interesting work, has for a subject "the investigation by the unimpassioned process of enumeration and weighing facts of structure what is the teaching of Nature as to the affinities of various apes to man." Mr. Mivart, always choice in his language and happy in expression, says that if there are points of resemblance between man and the apes such laws of affinity form a "tangled web" or "net work" rather than "the ladder," from which a blood relationship can be argued. Though Mr. Mivart does not assert the fact, we suppose like other naturalists he places the orang outang as nearest in physical structure to the genus *homo*.

—Sometime ago the question was asked of us by a correspondent in regard to the proper name of the "Cape Pigeon," a bird found off Cape Horn, and a few degrees north of the Cape:—Wings white, barred with black, head black, with white or slate-colored breast. Answer—The name is, *Dioptron capensis*, Steph, formerly of genus *Phalassidroma*, Family, *Procellaria* or Petrels, about the size of a small duck.

THE SIAMESE AUTOPSY.

DR. PANCOAST'S REPORT—IMPORTANT AND INTERESTING PARTICULARS.

THE correspondent of the New York *Herald* gives the following account of the result so far of the autopsy made by Dr. Pancoast:—The twins themselves were not pleasant to behold, their lower extremities only being covered with a slight drapery. The skin of the abdomen anteriorly was thrown entirely back, exposing the entrails, the opening extending down the lower extremities. The body of the one who died first was pervaded with a dark, bluish tint, while the corpse of the one who died last was comparatively white, showing conclusively that the blood had flowed from the living into the dead and coagulated in the veins of the latter, rendering the same, as subsequently shown, more easily to be preserved. The navel, as heretofore stated, was directly in the centre of the connecting link, no other umbilicus existing.

The nervous connection of each extended only to the middle of the band, and hence a pin stuck in the one made no impression whatever upon the other. Hence when Eng awoke and found Chang dead, had he cut a lump of flesh from his brother he might have saved his own life and produced no pain upon himself, because, as just stated, the construction of the nerves of the two was entirely independent, extending only to the middle of the band. The band was found to contain two pouches resting one against the other, the outlines of which might or might not have been gone around while the twins were alive; that is, the question of their separation is still a doubtful one. There is very little nervous distribution identified with the pouches. Reflections of the peritoneal membrane occupied the interior of the band connecting with the abdomen of each, and formed the separating sacks or pouches of the membrane.

The liver of each individual lay close to this band, adjacent the one to the other; hence the liver of one was abnormally placed on the side contrary to that in which reposed the liver of the other. In fetal life it is conjectured that the twins had a common liver, as an injection in the mesenteric vein of the one passed into the mesenteric vein of the other. They also possessed a common navel, or umbilical cord, which until the moment of investigation was a matter of great doubt.

Another peculiar fact is that the brain of the smaller was the most acute and powerful, although he was the most dissipated of the pair. One was a jolly, "hail fellow well met," while the smaller one was peevish and fretful. Although the contract with the family prevents any examination of the brain, the great contrast in disposition shows the brain of each to have been totally and entirely distinct. The investigation has, thus far, not proceeded to the heart, and this organ is as yet involved in mystery, as the brain and liver of the two are distinct. As a matter of course, however, there cannot be a single heart.

The livers, which may have once been united, are now separated; and on account of its abnormality furnishes in itself a curious study. The brain of each is independent, as likewise are the hearts. The statement as to a joint existing in the middle of the band is incorrect and ridiculous, there being no division of the cartilaginous attachment of such a nature.

It is supposed that during life each slept upon his stomach; while the nervous independence of each is again established from the fact that while one slept soundly the other was known to be awake. The cause of the blood rushing from one to the other at the time of the demise is explained in the fact that, independent of the pouches, which are simply reflections of the peritoneal membrane, there exists arteries which, in case of separation during life, might have been tied, as they could have been, had the one who died last cut a piece of flesh from the one who expired first. The most interesting part of the investigation is yet to come—namely, that of the pericardium or membrane which closes about the heart.

The Horse and the Course.

—Dan Mace, the well known driver of trotting horses, who had been seriously ill for the last few days, died on Monday, February 23d.

—The Utica, Buffalo, Cleveland and Springfield Associations have decided upon the trotting and running programme for 1874. The aggregate prizes will amount to the extraordinary sum of \$150,000.

—Mr. McGrath's wonderful horse, Tom Bowling, is ready to run any horse in America, weight for age.

Mr. D. H. Blanchard, the originator of the Stallion Purse of \$10,000 at Mystic Park, Boston, will give to the winners gold medals, six and a half inches in circumference, two inches in diameter, and nearly a quarter of an inch in thickness. On one side will be the engraving of a stallion, and on the reverse the name of the winner, date of the race, and the amount of the purse won. Among the number of stallions that are to be entered are Fearnought, Jr., and Smuggler. Appearances indicate that the stallion trotting race for the championship of America will be the most popular race ever trotted in this country.

—Hugh McCrum, of San Francisco, has laid a wager with S. R. De Long, of Tucson, Arizona, by which he agrees to forfeit \$2,000 provided De Long succeeds in riding his horse Jerry from Tucson to San Francisco, in twenty-five days, leaving Tucson on the 20th day of March, 1874, at 9 A. M., arriving in San Francisco on or before 9 A. M., April 14. Should the journey not be accomplished within the time specified, then S. R. De Long forfeits to McCrum the same amount. The route to be taken is via Wickenburg, Ehrenburg, San Bernardino and Los Angeles, to San Francisco by overland stage route. The projected race has already excited much interest in Tucson and San Francisco.

The Magazines.

LUCKY OMENS.—Odd numbers—barring the ever fatal thirteen—are thought to be lucky. The shrill piping of the household cricket is prophetic of happiness to the hearth it haunts, as surely as the settling of a stork upon a Dutchman's roof-tree bodes pleasant times to the dwellers beneath it. That forlornest of animals, the masterless dog, that follows close upon the heels of the night walker, and will not be balked of companionship, is a certain luck bringer. Black cats should be at a premium, considering a stray puss of that hue who takes a fancy to establishing himself in a house, introduces good fortune with him; while a cat of any color, whether an uninvited visitor or an acknowledged member of the family, ought never to be restrained from sharpening his talons at the expense of the table's legs, since, when he thus scratches, he scratches for luck. Pat kindly the head of the first lamb of spring, if you have the chance; it will bring prosperity to you and yours; but avoid the innocent creature if it presents its tail to view. Hail the first hearing of the cuckoo's voice with thankfulness, if he salutes you upon your right hand—then his greeting is an assurance you will make your way in the world, and attain the highest object of your ambition; and begrudge not a sip of good liquor to the busy, curious, thirsty fly, dropping into your glass, but welcome the intruder as heartily, if not as poetically, as Oidys did; he brings good luck to the glass and the drinker too. Absent minded and careless dressers are likely to be often in luck's way. To put on any garment wrong side out, provided we are not neat enough to spoil the charm, is an infallible prognostic that something is about to happen which will profit the sloven greatly. Mr. Village tells us, in the *Connoisseur*, how his pretty country cousin came down to breakfast one morning with her cap on wrong side out, whereupon her mother solemnly charged the heedless lassie not to alter her headgear all the day, for fear she would change the luck.—*Chambers' Journal*.

SOUTHERN NAVIGATION.—Probably there are some people who do not know that we have steam communication between New York city and southern North Carolina all the way without going to sea, and over sixty regular steamers do the business of the route. The route is along the Raritan River to New Brunswick and the Delaware and Raritan Canal to the Delaware River, thence through to the bay and on through the Delaware and Chesapeake Canal to the Chesapeake Bay, thence to Norfolk, and on through the Albemarle and Chesapeake Canal into Currituck and Albemarle Sounds, and away along again through Pamlico Sound and the Neuse River to Newbern. Vessels that will not live in the ocean passage can go inland all the way from New York to Newbern when the canals are not frozen. Mr. Marshall Parks, President of the Albemarle and Chesapeake Canal Company, says it is practicable to go all the way to Florida that way with a little more expense. During last year there passed through the Albemarle and Chesapeake Canal 2,075 steamers, 1,380 schooners, 592 sloops, 225 barges, 886 lighters, 460 boats, and 152 rafts, and there is no doubt that this is a small showing compared with the business done by the Chesapeake and Delaware Bay and Delaware and Raritan Canals. So our coasting trade of this kind is not an unimportant affair.—*Journal of Commerce*.

—The following facts are interesting regarding the relative weights of men and women. The average weights of boys at birth is a little over six pounds and a half, while girls fall a little below this figure. At twelve years the two sexes increase in weight in the same ratio, after which time boys take the lead. Young men of twenty average about one hundred and forty-three pounds, while the average for young women of the same age is twenty-three pounds less. Men reach their heaviest bulk at the age of thirty-five, their average weight at that time being about one hundred and fifty-two pounds. A woman weighs the heaviest at fifty years, and is about one hundred and twenty-eight pounds. The weight of the man or woman at full growth is about twenty times that at birth.

—During the reheating of the furnaces in an iron establishment in England, says the British Journal of Science, the men worked when the thermometer, placed so as not to be influenced by the radiation of heat from the open doors, marked 120 degrees. In the Bessemer pits, the men continue a kind of labor requiring great muscular effort at 140 degrees. In some of the operations of glass-making the ordinary summer working temperature is considerably over 100, and the radiant heat to which the workmen are subjected far exceeds 212 degrees. In a Turkish bath, the shampooers continue four or five hours at a time in a moist atmosphere at temperatures ranging from 105 to 110 degrees. In enamel works, men labor daily in a heat of over 300 degrees. On the Red Sea steamers, the temperature of the stoke hole is 145 degrees. And yet in none of these cases does any special form or type of disease develop itself.

DANGER FROM WET CLOTHES.—Few persons understand fully the reason why wet clothes exert such a chilling influence. It is simply this. Water, when it evaporates, carries off an immense amount of heat, in what is called the latent form. One pound of water in vapor contains as much heat as nine or ten pounds of liquid water, and all this heat must, of course, be taken from the body. If our clothes are moistened with three or four pounds of water, that is, if by wetting they are three pounds heavier, these three pounds will in drying carry off as much heat as would raise three gallons of ice-cold water to the boiling point. No wonder that damp clothes chill us.—*Handicraft*.

—A perplexed fellow mortal was seen standing before one of our dry goods stores, last week, for nearly an hour, gazing intently at a tow string which was about his little finger. When asked what he wanted, he replied: "Darned if I know! Mother put this tarnal string on my finger so's I shouldn't forget what she wanted me to git, 'nd here I've been standin' more'n an hour, tryin' to think what in thunder it was."

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, traits, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.]

G. W. D., Hannibal, Mo.—Send to Chas. Suydam, 41 Warren street, for *Fur, Fin and Feather*.

R. K. ALLERTON, Mount Vernon.—In our opinion you can procure a more suitable weapon than the one you mention. See advertisements.

H. S. C., Ulster county, N. Y.—Where can I buy a brace of ferrets? Ans. Write to Fred Mather, Honeoye Falls, New York.

E. S. WILLIAMS, Fulton street, Brooklyn.—What is a good weight for a five prong buck? Ans. 260 lbs.

A. P. V., New York.—You had much better write to O. H. Hampton direct. He can give you more accurate and fuller information than we can on the points you ask for.

A. B. C., Buffalo, N. Y.—The fox hound bitch has been shamefully treated. The best thing you can do is to destroy her, as the offspring will be sure to inherit the apparent terror and fear at the sight of man.

W. H. S., Columbus, Ohio.—At what can you import for me a pair of springers or cockers. I want them to drive the ruffed grouse out of the laurel swamps? Ans. A pair of "springers" would be the most useful. They should be not older than six months on their arrival here. The price would be about \$85 a brace.

D. H., New York.—Do you think a Spanish setter dog brought on from Spain would retain his good qualities on this soil? Ans. This is a mooted question. We think it would be worth while to try, and should advise you by all means to import one, but be sure he is of known breed, a young dog, and a noted field performer. Pointers and setters in Spain are sold at a very low figure.

W. H. S., Chestnut street, Phila.—What is a Dandie Dinmont dog? Ans. A breed of Scotch terriers, a capital rabbit dog; also good house dog. The color is grayish black, with some tan on muzzle and legs, or yellow mixed with gray hairs. He has short legs, low shoulders, long body, large head, square jaw, a bright and intelligent eye.

GAME BAG.—The answer in a recent number of this paper that "a man has a right to do as he pleases with his own property" is not endorsed by the editor of this paper. The whole subject of privileges and protection will be thoroughly considered in these columns on and after next week. A large batch of correspondence relating thereto has accumulated on our desk, which will be published.

B. O. HICKS, Brownsville, Texas.—We can procure you, by importing, a small water retriever. The Irish breed are the most serviceable. A dog not over two years old, thoroughly broken and of the best blood will cost \$12, or 75. If you do not require the very best pedigree of noted water retriever, for breeding, the price would be considerably less.

Taunton, Mass.—Taking Boston as a starting point, what would be the expense of a two weeks' fishing trip to the Western Schodics in Maine for an economical person? Ans. About \$60. What kind of fish can be caught there in July? Ans. Landlocked salmon, teague, trout, pickerel, perch, &c. What rods suitable? Ans. If you are an expert angler, take a bamboo trolling rod, and an eight ounce split bamboo trout rod, but a heavier rod will serve most persons best.

MURDOCK & Co., Pittsburg, Pa.—The gold fish or golden carp, *Cyprinus auratus*, breeds all sorts of colors; the young are black; some change the first season, becoming pied or blotched with red or white; some remain black for years, others soon become red, white, or straw color. The red ones are called goldfish by dealers, and the white ones silver fish. The progeny of the black ones are as likely to be bright as any. Your water and stock fish are all right, but the brightness of your fish you will see is somewhat a question of chance.

M. O. G., Greensburgh.—Will you please inform me of the color, point, &c., of the Laverack and Gordon setters, and whether they are imported breeds? Ans. The Laverack is an imported breed; all of them derive their origin from the "Belton." Color black, or blue and white ticked, also lemon and white. The Gordon is also imported; color, black-and-tan. They are longer in the leg and looser in the loin, heavier and coarser in the head, thicker in the neck, more throaty than other breeds, and not so clean made in the limbs or so short in the back, but are very beautiful dogs.

TO SEVERAL CORRESPONDENTS.—We are indebted to the publishers of the *Juniata (Nebraska) Gazette* for the following information as to the hunting facilities in Adams county, Nebraska:

"Adams county is situated in the southern part of Nebraska, 45 miles from State line, and about 160 miles west of Missouri River. It is one of the best parts of the State. Game is quite plenty. Buffalo, elk, antelope, prairie chickens, geese, and most all other kinds of game. No fish to speak of, except in the Platte River, 12 miles north of us. As to Indians, there are none, except as they pass through here on their way to the hunting grounds, and that occurs about twice each year. They are quite peaceable but are great beggars. No danger from them."

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

AT

103 FULTON STREET, NEW YORK, and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, FEBRUARY 26, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their perusal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,

Managing Editor.

TRANSFER.—As has already been announced in the daily press, a one-third interest in the capital stock of FOREST AND STREAM has been sold for \$8,500 to William C. Harris, Esq., late of the *Trade Journal*, Philadelphia, who will, in a few days take entire charge of its business affairs. Until such time our branch office at 125 South Third street, Philadelphia, will remain under his supervision. Under the efficient management of Mr. Harris we look for increased prosperity and business patronage, and feel that the transfer thus made will be for the advantage of all who are directly or indirectly interested in this journal.

CHARLES HALLOCK, Editor.

THE HUDSON RIVER SALMON.

OUR esteemed cotemporary of the *Troy Whig*, in his paper of February 13th, suggests a possible failure of the attempt to stock the Hudson River with salmon, on the grounds that for some reason unknown the river was never frequented by this fish. He thinks that if the fry are put into the upper waters of the Hudson they will doubtless find their way to the sea, but never come back in numbers to create a profitable fishery. This anticipation, however, is entirely contrary to the every day experience of fish culturists in America and Europe, since it very often happens that fish thrive better in new localities than in those from which they were transferred.

Certainly, as far as the black bass is concerned, they have never been known so plenty in the western waters, from which they were brought to the Potomac, as they are now in that river, in which they were placed only about twenty years ago, and the experience of other localities is of very much the same character. Our eastern trout is successfully propagated in California; and many similar exchanges of the trout family, to say nothing of bass and shad, are on record. Of one thing, however, we may be certain, if the upper waters of the Hudson are suited to the growth of the salmon and they go down to the sea, they will be sure to come back again, since nothing is more firmly established than the fact that fishes always return during their breeding season to the place whence they started as young fish. Even, therefore, if there be impassable dams to prevent their reaching the head waters where they were first introduced, they will proceed as far up as they can, and may be taken in one part of the river if not in another.

It must also be remembered that the salmon, to which

reference is made as being lately introduced into the Hudson, is not the species that formerly occurred in the Connecticut, and is now taken on the coast of Maine, but is a totally distinct kind from California. Given streams properly constituted, as far as purity and natural and artificial obstructions are concerned, the next question affecting the introduction of the salmon is that of the temperature of the water. We know that the temperature of the Connecticut during the summer, is quite as high as that of the Hudson. But should there be a difference, it must be remembered that the California species of salmon is accustomed to a much higher temperature than that of either river mentioned; the upper Sacramento indeed, during the summer season for months together, having a temperature of from 100 to 110° in the shade. At any rate, whatever be the actual result, we cannot know it without an experiment, and it is to be hoped that every facility will be given to this effort. For ourselves we have not the slightest question that if the operations of the United States Commissioner and his colleagues in the States, are properly supported for a few years to come, all the rivers of the eastern coast, as far south at least as the Roanoke, together with the appropriate tributaries of the great lakes and the head waters of the Ohio and Mississippi, will become the localities of profitable salmon fisheries.

THE NEWFOUNDLAND TELEGRAPHIC MONOPOLY.

WE have been favored the past week with several interviews with Michael Carroll, Esq., an eminent naturalist and historian of Newfoundland, who is now in this country for scientific objects, and at present in Washington. Mr. Carroll has brought to our attention some important facts which will be new to some persons and perhaps forgotten by many, but which are neither new nor forgotten by the telegraphic monopolists, who have so long held the key to the ocean cable telegraphic system.

Newfoundland holds a position of peculiar interest to the people of this continent, for upon it rests one end of the Atlantic cable, and across it passes the single land wire which, connecting with the cable, puts the whole business world under constant tribute, and dictates the cost of telegraphic messages. At this remote place North and South America on one side, and Europe, Asia, and Africa on the other, must all pay toll for their correspondence; and even though cables should girdle the world, it is still at Newfoundland they are called upon to stand and deliver. The remote cause of all this is that on April 15, 1854, an agreement was entered into between the Legislature of Newfoundland and the "New York, Newfoundland and London Telegraph Company," by which the Legislature granted to this company the exclusive right to build, make and occupy a line of telegraphs between St. Johns and Cape Ray or between any other two points; and for a period of fifty years exclusive right was granted to this company, and no one else was to be allowed to build a telegraph on the island. But (but have sometimes the happiest effects) the legislature allowed themselves a fortunate loophole, having inserted this proviso that at the expiration of twenty years, if they thought well of it, they might buy back from the New York, Newfoundland and London Telegraph Company the telegraph line, paying a fair price for the wires, poles, cables, etc. Now on the 15th of April, 1874, exactly, the twenty years expire, and the legislature are going to take back the land telegraph line into their hands. Of course as this line has so far controlled all the cable lines, it has prevented any other cables having their ends at Newfoundland. In fact it was the pigmy of a land telegraph which commanded the situation. Legal decisions of the greatest English lawyers show that the Newfoundland legislature has a perfect right to buy the land line when they please to do so. Everybody in the world will be delighted when this monopoly ceases, which was as unnatural and impossible as if the effort was made to pass the whole current of the Mississippi through an inch pipe.

Mr. Carroll is deeply interested in this subject, having made the surveys of the present telegraph route, and he thinks, as we do, that when this monopoly is swept away more telegraphic cables will instantly be laid down, and that the importance of Newfoundland will thereby be wonderfully increased.

THE SPECIES OF BLACK BASS.

AMONG the various candidates for popular favor, for introduction into new waters, the Black Bass has always deservedly occupied a very high place. The excellence of its flesh, its rapid growth, its endurance and its game qualities, all contribute towards this appreciation. Little by little this fish has been carried from one part of the country to another, until now there is no part of the United States, east of the Rocky Mountains, where it may not be found in greater or less abundance. Its great merit in this connection lies in the fact that it requires no care in the way of culture, since a few pairs transferred bodily, will in time furnish a numerous progeny. In consequence of its habit of making a nest and guarding it against intruders the fish is enabled to readily secure the perpetuation of its race.

Much uncertainty has existed, until recently, as to the number of species really entitled to be called Black Bass, many having been described and supposed to be peculiar to particular waters. Prof. Gill, of the Smithsonian Institution, has lately made a critical and exhaustive investigation of this subject, and with the aid of the large amount of material belonging to the Institution and that of the Museum

of Comparative Zoology at Cambridge, he has come to the conclusion that there are really but two distinguishable forms; the one the *Micropterus salmoides*, or the small mouthed bass, and the other, the *M. nigricans*, or the larger mouthed variety.

Both of these species occur naturally over a great part of the United States, with the exception of New England and the Atlantic sea board of the Middle States, although only one, the small mouthed, seems to have been originally an inhabitant of the hydrographic basin of the Ohio. It is not to be understood, however, that there are no variations from the standard type to be observed in the bass of these two groups, in different localities, and it is not improbable that a careful criticism will reveal certain trifling peculiarities, which may serve to distinguish those belonging to a particular area. The differences of the two primary forms are, however, perfectly appreciable, so that even the veriest tyro, seeing them side by side, must admit their distinction.

These differences, as stated in the paper of Prof. Gill, are as follows:—

CONTRASTED DIFFERENTIAL CHARACTERISTICS.

Scales of Trunk.	
SMALL-MOUTHED.	LARGE-MOUTHED.
Small (<i>e. g. lat. line</i> , 72-75; between lateral line and back, 11 rows).	Moderate (<i>e. g. lat. line</i> , 65-70; between lateral line and back, 7½ or 8 rows).
Scales on nape and breast.	
Much smaller than those of sides.	Scarcely (on nape), or not much (on breast) smaller than those of sides.
Scales of cheeks.	
Minute (<i>e. g.</i> , between orbit and preoperculum, about 17 rows in an oblique line and about 9 in a horizontal one).	Moderately small (<i>e. g.</i> , between orbit and preoperculum, about 10 rows in an oblique line and about 5-6 in a horizontal one).
Scales of interoperculum uniserial.	
Covering only about half the width of the bone.	Covering the entire width of the bone.
Scales of preopercular limb.	
None.	Developed in an imperfect row (<i>e. g.</i> , 3-5 in number).
Scales on dorsal.	
Developed as a deep sheath (involving last spine) of small scales differentiated from those on the back, and with series advancing high up the membrane behind each ray (except last two or three).	Developed as a low (obsolete) shallow sheath, and with series ascending comparatively little on back, and with series advancing behind last five or six).
Scales on anal.	
Ascending high behind each ray.	None (or very few).
Supra-maxillary.	
Moderate.	Large.
Ending considerably in front of higher margin of orbit (about under hinder border of pupil).	Extending considerably behind the posterior margin of orbit.
Rays.	
Dorsal articulated, 13.	Dorsal, articulated, 12 (I. 11).
Anal III, 10 11.	Anal III, 10.
Pectoral, 1 16-1 17.	Pectoral 1 14 (1 13).
Dorsal fin in front of soft portion.	
Little depressed, the ninth spine being only about a half shorter than the longest (3, 4, 5) and a fourth shorter than the tenth.	Much depressed, the ninth spine being only about a fourth as long as the longest and a half as long as the tenth.

A MENAGERIE IN WINTER.

THOUGH it was not precisely an arctic temperature, yet the jingling of the sleighbells on one side, and the scythe sharpening sound of the skate irons on the other, the sleighing parties on the road, the skaters on the lake at the Central Park, all recalled winter.

How do our friends, the wild beasts, pass their winters in their close quarters? we asked ourselves. Do the animals of warmer climes, as they look through the windows, wonder what all this brilliant white covering of nature means? Fancy an African lion plunging through a snow drift, or a tiger skimming along on ice; or the reverse of it, a Polar bear wallowing in the red hot sand of the Sahara.

Somewhat imbued with the queer anomalies of things, men and beasts in general, our reverie was broken when we found ourselves in front of the jackall den at the zoölogical building in the Central Park, or rather at the back of the cages, a place of privilege kindly allowed us by Mr. Conklin, the Director of the Menagerie. What an old, rusty, weather beaten, dilapidated, second-hand-hair-trunk looking thing a hyena is.

"Them's the scavengers of the place," remarked Mr. Lannon, the feeder; "it is bones we feed them on. What the nobler animals leave them jackals devour. Their teeth are not long, but they have a tremendous jaw power. Now the lions can crack most anything in the way of a bone like a hazel nut, but for steady gnawing, a continuous kind of grinding that makes bones as fine as mill dust, the jackals is the boys. Now here is a piece of neck, most all bones; a lion would turn his nose up at it. I will have to get two pieces or there would be such a fight and howling as would disturb the whole place; and you will see for yourself." Saying this, Mr. Lannon procured two bony pieces of neck, which he slung into the hyenas' cages. How they both, male and female, precipitated themselves on the first piece thrown in, and snarled and yelled and laughed hysterically and demoniacally, until each got his own chunk, and then they commenced the mastication of their separate pieces! How they plied their vice-like jaws, armed with rather short teeth, and how the phosphates and the silicates of lime were disintegrated, broken up and swallowed! Query—Might not an over use of phosphates develop, besides brain, certain ferocious instincts? It is a question physiologists may yet determine. There are always redeeming traits about animals, which Oriental people are fond of recalling. "She walks adorably, glides like a swan," would say our tamer rhymer, apostrophising his lady love. "She waddles like an elephant," would be the compliment to a lady's movements paid by the Birmah poet laureate. Of course we do not know whether Hafiz, the Persian, ever spoke about the eyes of the hyena in his verses, but we do declare that the eyes of this otherwise ugly beast are soft,

lustrous and liquid; of course there are no depths of thought in them, as Walt Whitman declares he sees in the eyes of oxen, but there does exist a certain roguish expression which is most taking. But of course how much merriment or jocularly there may be in a hyena, his laugh not included, judging him by his eyes alone, we are not prepared to say. We were carried somewhat away with these fine eyes, but as Mr. Lannon remarked, "if that fellow had you down he'd just gnaw through an arm or a leg bone of your'n like a tiffy, for he is a mighty treacherous fellow." Poetic though we might have been, Mr. Lannon knocked all ideas of the future happy apocalypse from under us, and we recalled, applying it to the jackall, that scoffer's remark "that the lion would only lie down with the lamb when the latter was in the former's belly." "The one we raised, (here he is,) a lovely hyena for a year old, is not much kinder, though from his bringing up he ought to have more decent manners. Oh, those ugly bare spots on his head, and how does that happen? Just pure pig-headedness, trying to bust his head against the bars agetting a bone. Don't hurt 'em a bit."

"But here are my pretty beauties, such a dear little pair of lions. Come here and have your heads scratched. But what we do pride ourselves on are our Puma cubs. Just look how straight they are on their legs. Animals born in menageries are mostly splay footed and weak in the joints. We have two sets of Puma cubs. That single one is eighteen months old; that brace about four months old. The father was a lovely animal, and extraordinary in some respects. Was brought up by hand and nursed by an Indian woman, not on a bottle but at her own breast, when he was but two days old. The mother Puma is from Texas, the father from South America. There is a little difference as to color between them, perhaps he is a shade the lighter in fur of the two."

Mr. Conklin, the Director of the Zoölogical Collection, still limping from the terrible shaking a vicious camel had given him some two months ago, here joined us. Some time before we had watched at very close quarters the action of the fine large lion, (the animal on the right in the menagerie building as you enter from the Fifth avenue side.) We were desirous of seeing for ourselves the rasping quality of the lion's tongue when in the act of licking his food, and had pretty thoroughly followed this gustatory process. Sure enough off went the layers of flesh and the meat fibre by the action of Mr. Lion's tongue as easily as an urchin would suck off a piece of molasses candy. This same lion lost (we think it is on the left side) one of his largest teeth, but its absence never for a moment suggested to our minds the necessity of the Park Commissioners treating him to a false one.

"The power of jaw the lions use is immense, but," remarked Mr. Conklin, "none of the animals can manage the knuckle bone of a well grown cow or ox; either it slips out of their fangs, or they can't encompass it; but most everything else in the way of bones the lions can break up if they want to."

It suggested itself to our minds that it would be an interesting question to find out what would be the resistance a new, fresh shin bone of an ox would offer to a rending or crushing power. With one of Wade's machines the exact force requisite could be easily found, and in this way we might approximate the muscular power a lion has in his jaws. But how to measure the terrible effect of a leonine *pat* would be beyond our powers. The "pat," we use the word designedly, is a peculiarity of the feline race. We can try it now with our stick on this tiger. He is an elegant ruffed fellow, his hair bright orange and tawny, standing out like a compound of muff and whisker all round his head and neck. Of course he knows we are in fun, but he lifts his paw and gives the stick a side stroke, something like a man would do with the flat of his hand, the ball socket at the shoulder joint working freely, and with the pat he gives we feel the stick tingle in our hand. In the domestic cat it is strong enough to knock over and stun a rat, but a well directed side stroke on the part of the lion simply annihilates the human or bestial form. If the lions are somewhat more of bone crushers and coarser feeders, the tigers are rather daintier bone pickers, and clean the osseous and scaffold completely of its flesh covering. A lion eats majestically, a tiger rather suspiciously, but the leopard eats spitefully, curling his lip at you, and giving out an ugly hiss every now and then.

We had time to see the four sea-lions get their chowder, which was in the guise of a large tin pail full of fish. With the sea-lions it was clean deglutition, the fish going sliding down the gullet without a single chaw. It was turn and turn with three of the sea-lions, each one after the other, and they caught food in their mouths as the fish were slung to them without ever missing one. One sea-lion sat melancholy and alone, basking in the sun, snoozing and nodding in a kind of dog nap.

"Anything the matter with him, Mr. Lannon? He don't seem to be hungry," we said.

"No; it is a way they have. They will keep off feed sometimes for a week or two, and then come on as ravenous as ever."

As we gazed at the mystical figure of the dormant sea-lion, o'er whose lustrous body there came a gleam of wintry sunshine, as he dozed and nodded, sometimes opening his human-like eyes (somewhat goggled) we wondered if the Egyptian had not brought to old Thebes a faint recollection of the sea-lion acquired from some original northern race familiar with the *phoece*, whose very name and appearance had been long ago forgotten, in past ages, and so converted the sea-lion into the enigmatical sphynx.

It does not do to be too imaginative in a menagerie, especially as reverie and elephant trumpeting do not go well together, and so having admired the sacred bull, a neat, dapper little animal, as sleek as a partridge, with such a pretty head and clean limbs, we went to see the famous Kerry cow and bull, the newest acquisition. The best masculine expletives in regard to descriptions of these dainty little specimens of the bovine race would be out of place. "Sweet things, pretty darlings," said a nice young lady by our side, as she rubbed the tiny cow's head. "By my soul," said an Irish laborer as he viewed them, "real Kerry cows, and by the token, many's the time I've seen 'em. Swate milk and swate butter ye would be talkin' about, were ye ever lucky enough to ate it or drink it. It's jest them that makes it. What's your elephants or alligators by the side of 'em? nothing. Och, your darliuns." And pretty beasts they were, and the best idea we can give of them is to say, just what Shetland ponies are to dray horses, so are Kerries to the ordinary cows. When summer comes and rich pastures flourish, these Lilliputian animals will be an ornament to the pretty Park landscape. A draft of milk from such a dainty little cow must taste far sweeter, be more redolent of daisies and butter-cups, than the lacteal productions of your ordinary grosser animal.

An hour or more passed in the Zoölogical Department of the Central Park in winter gains an interest from the effect of contrast. If we are conscious of snow and frost and ice outside, the animals, happier than ourselves, are ignorant of the rigors of climate, for Mr. Conklin is their second Providence. It may be below zero in the Park, even alongside of the lady companion who shares your sleigh with you, but beside the tiger inside (Charles Lamb's joke not intended) the temperature must be always kept at 60 deg.

DISAPPEARANCE OF A RACE OF MEN.

MR. Nordhoff, in an interesting paper on the Sandwich Islands, endeavoring to give some reason for the steady decrease of the inhabitants, is unable to account for it in any other way than by the supposition that when the Polynesian wears European clothes such habiliments ultimately kills him. In fact the pants, the boots, the shoes, the shirt collar of civilization must act on the aboriginal, according to Mr. Nordhoff, as did Dejaniera's tunic upon Hercules. Smile as we may at this original idea, when we come to look at it closely there is much more in it than appears at the first glance. Without entering into an eulogium of civilized costume, admirable as to texture and color, but miserable as to shape, it is certain its adoption is not fitted for all climes. Questions of decency being set aside, Mr. Nordhoff argues that the Otahitian wet to the skin, remaining in his clothes, catches cold and dies of rheumatism or consumption. It is apparent that for the preservation of the clothes' wearers there are other elements necessary, such as of cleanliness and the ability to procure shelter. But even with all the opportunities given to those who might enjoy the advantages of civilization, it is quite doubtful whether certain races of men in peculiar localities would not be a great deal better off *in puris naturalibus* than if clothed in swallow-tailed coats made of glossiest broadcloth. Not disposed, however, in the least to treat in an amusing way this most serious question of the depopulation of the Islands of the Pacific, anthropologically it is most interesting to study the facts, though the reasons for the decrease may not be fully ascertained.

That a certain depressing influence is possessed by the white man which extirpates in time inferior races, though not proven, is undoubtedly true. Civilization, with its blessings, brings with it a train of evils, such as diseases and the use of stimulants.

That these sinister influences have had a terrible effect among the people of the Sandwich Islands every one knows. Though every islander there may read and write and attend Sabbath school, and behave as a Christian, still he cannot prevent death, and death which comes to him earlier and in a more general way than to the inhabitants of those countries from which his civilization is borrowed. Here, however, it might be advanced that the white man is in large proportion and that his sinister influence was more directly felt by the Polynesian. What shall we say of an island, insignificant as to size, sparsely occupied by the natives themselves, scarcely inhabited by the white man, where the natives are to be found imperceptibly fading away like snow before the sun of the white man?

In the *Anthropological Review* we see the case of the Gambier Islands cited. Discovered in 1797, they were first occupied by missionaries as late as 1834. In that year certain good French Fathers went there and found the sum total of people to be about 2,141. To-day there are but 936 people. In eleven years there were 2,061 deaths and only 1,581 births. From the calculation made of the possible deaths and births it seems pretty certain that in a few years no native will be alive.

During the last thirty years the islanders have enjoyed the most profound peace. The missionaries are more than careful as to the morality of their flock. Diseases have not been introduced by the whites, food is in fair quantity, no liquors are to be had, and everybody is vaccinated and decently clothed, marriages between the whites and the natives are of the rarest occurrence, but consumption is sweeping the islanders from off the face of the earth.

The only argument that can be deduced is one of a physiological character. The population of the island being small, and fresh blood, new strains of life, being impossible of introduction, after the race has arrived at a certain excellence of mind and body, it must, about our present period, have commenced to deteriorate. Whether this change

was first visible in the mental capacities of their enfeeblement, of course we have no opportunity of judging, as this could only be discovered by comparisons with the mental calibre of natives who had long passed away, but that the physical retrogression, the want of vitality, the inability to resist disease, is manifested to-day, is quite evident.

Humanity should take such subjects in hand, and anthropologists might, instead of wasting time in speculative science, enter at once into the field and devise measures for the preservation of a race which without some assistance must in time disappear from off the face of the earth. It seems to us that human races could be preserved, just as are the beasts and fish. Pretty much the same laws govern all creation.

POINTER AND SETTER MATCH—MR. G MACDONNA IN THE FIELD.

THE following letter from the Rev. J. Cumming Macdonna was received by us last Tuesday, and will be read with some regret. However, we feel interested to know that the Reverend gentlemen has disposed of his kennel of valuable dogs, with all their engagements to G. Macdonna, Esq. This latter gentlemen, it appears, is well acquainted with the United States and speaks of the country and people in the most enthusiastic manner. It will be understood that although the Rev. J. C. Macdonna has parted with his kennel of dogs this will in no wise interfere with the coming match:—

WEST KIRBY, BIRKENHEAD, ENGLAND, February 13, 1874.

EDITOR FOREST AND STREAM:—

I see you have had a photograph of "Belle" published as the best pointer in England. It occurred to me you might perhaps wish also to have "Ranger" as the best setter in England, winner at the Bala Field Trials on grouse, also Ipswich Field Trials, and beating all other crack dogs.

I have just been appointed to an important Rectory—Rector of Cheddle, near Manchester, and in order to give my undivided attention to my new parish and parishioners have disposed of my whole kennel, in one lot, to G. Macdonna, Esq., who will carry out all the engagements of my dogs, including the great international match. Mr. Macdonna has been three times on a tour through the States, and is more of an American, almost, than an Englishman, so fond is he of its people and country, and so lively a recollection has he of the unbounded hospitality he received whilst in the States.

There is one point I join issue with you upon, in your very interesting article upon the forthcoming match, "The dog dropping to his point." Although to stand on point looks prettier, yet for high mettled dogs that will work till they die rather than give in, I think if they drop to their point it gives exhaustive nature a chance of recuperating itself by a rest, though it would be of short duration. J. CUMMING MACDONNA.

We feel highly complimented by this letter, as the Reverend gentlemen is one of the ablest writers and most careful and successful breeders in England. In regard to that portion of Mr. Macdonna's letter where he joins issue with the writer as to the dog dropping to his point, we beg to state that it would never do in this country to go back to the original instinct of the setting spaniel in the setter as unless the shooting should always take place in the *dead open* the dogs would be invisible half the day and take the field sportsman most of the time to hunt up his own dogs.

ART GALLERY AT AMHERST COLLEGE.—Professor Mather, of Amherst College, during his recent tour through Europe, visited many of the principal cities of Prussia and Bavaria, where we learn from the *Amherst Student* he succeeded in securing in those places for the Art-Gallery, the most extensive and complete collection of casts and photographs that has ever been attempted in this country, at least by any institution of learning. With only \$7,500—a much smaller sum than he had hoped to be able to spend—he has secured an amazing amount. The Professor says that one of the chief benefits arising from the trip and the purchases made, is the information which he gained. He learned not only the address of cast manufacturers and art publishers heretofore unknown in this country, but he found some of the finest works of art in the most out-of-the-way places imaginable. Hereafter the college can with perfect safety, order directly from these manufactures. The whole collection numbers nearly 2,000 objects, of which one hundred are casts. These casts comprise works of art never before seen in this country, and are for the most part of the full size of the originals; among them are a set of Phibertis' famous bronze doors to the Baptistery at Florence; these are twenty feet high and include all the cornices and moldings pertaining to the doors. There is only one other copy of them in the country. A full set of casts of the famous Elgin marbles, which were part of the prize of the Parthenon, will be placed around the hall in the shape of a cornice, while the rest of the hall will be occupied by the busts, statuettes, and the photographs. The latter comprise photographs of all the principal objects in the British Museum, copies of famous paintings, including many from the Shakspeare, Faust, Goethe, and Schiller galleries in Munich, besides views from Venice, Constantinople, etc. No one of these photographs being of small size, while many cost from \$9 to \$12 apiece.

TO NATURALISTS.—We wish to call the especial attention of naturalists to the article in this issue from the pen of Hon. J. D. Caton, of Ottawa, Illinois, upon the "glandular system on the hind leg of the cervidæ as designating species." Notwithstanding the long and thorough investigation which the writer has given to the subject, the importance of which has not been fully appreciated, there are some points that remain to be examined to fully establish and complete this chain of evidence, and if such as have facilities will examine carefully for the metatarsal gland on the outside of the hind leg of the European elk and reindeer, and for both glands on our barren ground caribou it may help to elicit the information so much desired.

A RISING ARTIST.—Mr. T. Sedgwick Steele, a prominent jeweller of Hartford, whose pleasant article on Lake Superior appears in our columns this week, has recently discovered to his great surprise that he has fallen heir to some portion of the genius of the great masters. Infatuated with out-door sports, dabbling a little in taxidermy and natural history, wielding a graceful pen and ready pencil, sometimes touching a little on color; having no particular aim or purpose beyond the whiling of a passing hour, he has unconsciously developed a talent for fish painting which, if cultivated, must make him the peer of Tait or Brackett. Taking the leisure of the present winter, he has patiently wrought out on canvas two studies of Trout which for accuracy of delineation, natural color and general life character must rank among the best artistic efforts. This is indeed a sweeping assertion and liable to challenge, though the fact of their excellence is no less remarkable than that they are entirely *gastlight work*, which shows an unusual eye for color on the part of the artist. One of these pictures represents a trout suspended from a nail by a fly hook, a situation that gives a fine opportunity for shadow effect. The canvas is 14 by 20 inches. The other study shows two trout of different size lying upon the pebbly margin of their native stream with a background of ferns and boulders. The freshness of this picture at once calls forth admiring encomiums, and we understand that Trumbull, of Hartford, has bestowed unqualified praise upon it. The bit of water, the rockery, and the ferns, make up an exquisite blending of natural features which serve to test very fairly the versatility of the artist. The canvas of this one is 9x12 inches. These paintings are on exhibition at Glazier's Art Gallery, in Hartford. Photographs of the same appear as if taken from nature. Mr. Steele's success ought to encourage him to further efforts.

HISTORICAL SOCIETIES IN NEW ENGLAND.—At the recent annual meeting of the New England Historic-Genealogical Society, in Boston, the President, Hon. Marshall P. Wilder, made an address, in the course of which he gave a list of the historical societies which have been organized in New England. The Massachusetts Historical Society was the first organized in the country. It dates from January, 1791. The American Antiquarian Society, of Worcester, Massachusetts, was established in November, 1810. This was the third organized in the country, the New York Historical Society having been formed eight years previous. The remaining New England Societies Mr. Wilder named as follows:—

Essex Historical Society, Salem, Massachusetts, June, 1821. This is now the Essex Institute, which was formed in 1848 by the union of that Society and the Essex Natural Historical Society.
Maine Historical Society, Portland, April, 1822.
Rhode Island Historical Society, Providence, July, 1822.
New Hampshire Historical Society, Concord, May, 1823.
Connecticut Historical Society, Hartford, incorporated May, 1825.
Vermont Historical Society, Montpelier, incorporated November, 1838.
Dorchester Antiquarian and Historical Society, Dorchester, Massachusetts, January, 1843.
Middlebury Historical Society, Middlebury, Vermont, November, 1843.
New England Historic-Genealogical Society, Boston, January, 1845.
Old Colony Historical Society, Taunton, 1854.
Prince Society, Boston, May, 1858.
New Haven Historical Society, New Haven, Connecticut 1862.
The Old Residents' Historical Association of Lowell, 1868.
New London County Historical Society, New London, Connecticut, October, 1871.
Nashua Historical Society, Nashua, New Hampshire.

A HUNTER'S GIFT.—We have received from Colin Campbell, Esq., a former citizen of Nova Scotia, a present of a *Moose muffle*, or the long flexible extension of the nose which the animal uses in browsing with the same facility that an elephant handles his trunk. This muffle is esteemed as rare an edible delicacy by Canadians as turbot is by an Englishman, green turtle soup by a New York Alderman, or birds nests by his celestial Highness Chang Fou. When dressed like a calf's head and boiled with pieces of salt pork, it forms a dish which neither epicure, gourmand or glutton would despise.

—Florida now swarms with sportsmen and tourists. St. George Gore is at Manatee, the Earl of Dunraven at Brevard; dozens of our leading citizens are exploring the various streams with well appointed yachts or boats, while invalids and regular tourists fill the hotels, which this year have been much improved. The St. James and National at Jacksonville, the St. John at Palatka, and the Brock House at Enterprise, offer every comfort to guests.

—Be it remembered that in the city of New York, the thermometer stood at 62°, northern exposure, at 7 o'clock on the evening of the twenty-third of February, 1874, one hour and a half after sunset. Twelve hours afterwards the temperature had fallen to 32°. What was the cause of this sudden heated atmospheric wave which made people doff their overcoats, throw open their doors and windows, and wilt as with midsummer heat? And now the Hudson river is open to Newburgh, boats are ready to run, but half the ice crop has been gathered, the birds are migrating northward, and everything indicates that according to the rules of meteorological precedents the seasons are out of joint.

—Washerwoman's motto—"While there's life there's soap."

PRESERVATION OF FORESTS AND CULTIVATION OF TIMBER.—At last our Government seems to have been awakened to the necessity of using some methods for the preservation of our forests. Some time ago we gave notice of the meeting of a section of the American Association for the Advancement of Science held in New York, composed of those gentlemen interested in forest culture, and we learn that the President of the United States has transmitted to the Senate and House of Representatives a memorial upon the cultivation of timber and the preservation of forests, and a draft of a bill prepared by the American Association for the Advancement of Science, together with communications from the Secretary of the Interior and the Commissioner of the General Land Office on the same subject, heartily approving thereof. The American Association request the passage of a law creating a commission of foresting, to be appointed by the President, and report upon the amount and destruction of woodlands in the United States, and what means should be adopted to provide against their waste.

—A distinguished member of the Pennsylvania Fish Commission, B. L. Hewitt, Esq., writes us as follows: "I am very much pleased with your advocacy of some genuine plan of co-operation for the better protection as well as classification of fishes and birds. When in the legislature I did my best to frame a general game and fish law for our State, and partially succeeded. There is no reason why the same latitude should have different close times, and not be identical in character. Being a Fish Commissioner of course I second anything in that line; exceeding fond of the "rod and line," I must confess great fondness for the "dog and gun," therefore you can readily see that I can cordially co-operate with the idea suggested, which must sooner or later receive and command attention not only from sportsmen but from the public at large."

—We are indebted to W. F. Whitcher, Esq., of Ottawa, for valuable public documents relating to the Canadian fisheries and regulations.

CREEDMOOR.

MATCH OF THE NATIONAL RIFLE ASSOCIATION—OCTOBER, 1873.

(Continued from No. 27 of February 12th.)

COMPETITION VII.

STATE PRIZE.

Open only to teams of twelve from each regiment or battalion of the National Guard of the State of New York, each being certified to by their Regimental Commander to be a regularly enlisted member in good standing of the regiment he represents, and to have been such on August 1, 1873. They shall appear in uniform (full dress or fatigue). Distance, 200 and 500 yards. Position standing at 200 yards, any at 500 yards. Weapon, Remington Rifle, State model. Rounds, five. Entrance fee, \$1 each man.

1.—To the regiment whose team makes the highest score, the State Prize, a Silver Trophy, presented by the Commander-in-Chief on behalf of the State of New York; value, \$500.
2.—To the highest individual score, a Gold Medal, presented by Adjutant General Rathbone; value, \$100.

3.—To the highest score in each team, a Gold and Silver mounted Remington Rifle, presented by E. Remington & Sons; value, \$75; 25 rifles, total value, \$1,875.
4.—To the regiment whose team makes the second best score, a Silver Cup; value, \$50.

5.—To the regiment whose team makes the third best score, a Silver Cup; value, \$25.
6.—To the second best individual score, a Life Membership in N. R. A.; value, \$25.

In case teams from two or more regiments from any Division of the National Guard (outside the limits of the First and Second Divisions) shall participate in this match, the one of such teams making the highest score will be presented by the Adjutant General, on behalf of the State, with a Division Prize costing \$100 as the prize of that Division—in all, six Division prizes; value, \$600.
Total, 30 prizes; value, \$3,175.
Competitors failing to score eight points at the first distance will be excluded from firing at the second distance.

Sporting News from Abroad.

IF English chroniclers, correspondents and special reporters have given somewhat ambiguously the account of the famous ceremony which united in holy bonds the Grand Duchess Marie of Russia and the Duke of Edinburgh, getting sadly mixed up in their translations of the Greek liturgy, and even misspelling the lady's titles, (the exact distinction between Cezravna and Czravna being not yet perfectly understood,) in regard to the Imperial hunt which followed the ceremony, our English friends, being undoubtedly more at home in sporting matters, have given us a most interesting account. His Grace of Edinburgh has no small reputation as a hunter, having battled with the lordly elephant, and so, perhaps, his Imperial father-in-law made up the Gatchina chase for his son in law's benefit. Russia eschews the admirable English fox chase or the less sportsmanlike boxed-up stag hunt, and tracks the bear in his lair, and takes to killing wolves. There must be a peculiar gorgeousness about an Imperial bear hunt, and manners and customs, taken no doubt from the period of Ivan the Terrible, are still in vogue. The bear is aroused to action by a band of horn players, who play, in unison, grand hunting *fun-fares*, and awaken bruin from his slumbers. If, however, ursus is hibernating and dormant, even after the band has given him a symphony of Wagner's, he is aroused from his den and slumbers by a spearman, and the hounds are let slip on the quarry. When the bear bolts or is brought to bay, a rifle shot ends the strife. Then the animal is put on a sledge of honor, with six prancing steeds to haul him, and with jingling bells the cortege glides through the snows. On the occasion of the Gatchina hunt the bag was fair enough, to wit, one bear, thirteen wolves, two foxes, and a few hares. We wonder whether the fine looking Duke Alexis when he joined General Custer on the breezy prairies of the West had not a better time of it when they laid the buffalo low? Though our gallant Yankee General does like musical effects, insisting that when he fought the Sioux his own men went at it more lustily while "Garry Owen" was being played, we hardly think the noble Russ or the General had any other music than the most glorious of all, the human voice, as with excited cheers and wild whoops and hurrahs they charged the lumbering buffalo on their fleet steeds on the grassy plains.

—"Idstone," the clever correspondent of the *Field*, has a most amusing letter in the last number of our most worthy contemporary. Speaking of the "many new and startling plans and theories started of late as to the uses of sporting dogs," he hits the nail on the head when he says that contrivances are made for getting the game up to the guns, instead of the guns, as in old days, going after the game. In writing about "driving game," this most excellent authority speaks of the sportsman of the day being lowered into a pit, (coffin like,) screening the front of his *cache* with furze, and most amusingly tells of a letter received by him from some infatuated pot hunter, who asks for "a subterranean retriever accustomed to being buried alive." One most interesting portion of this communication is where Idstone says; "as to using pointers and setters in covert *with belts or without them*, (the Italics are our own,) I am and have been using them in this manner for an American sportsman *

* But why use setters when there are dogs constituted on purpose. If they stand, where are they? If they don't stand, what will they be in the open by and by? And then as to backing where they cannot see one another. They do it in America because it is their fashion and their system, and it answers; but if they took to spaniels they would find their account in it, and they would never go to setters again, for they would answer better. * * * Now is it a setter's business to flush game, and is a dog put into a covert to flush it or not?" To this we have to reply that with us our American dog is called to perform a great many more parts than his English canine brother. He may not do each one thing as well as the special dogs of various breeds used in making up the English sportsman's equipage, but for all around work, a jack of all trade business, for rough work "of open country, interspersed with thorns, jungles, patches, and muddy places," as mentioned by Idstone, and for long going, a hundred miles or more of ranging, all additional requirements which we ask of him, our setter serves us wonderfully. About *belling* our dogs, however, that is a novel point which though we have heard of, we have never known to be practised, save with setters in the long prairie grass.

—The death of Baron Meyer de Rothschild deprives the English turf of one of its leading patrons. The possessor of untold wealth, as early as 1841 Rothschild spent a princely fortune on his stables, and though the dark blue and yellow cap of his jockeys did not always come in the first, still he had allotted to him a notable share of racing victories. The Mentmore stables were among the most famous establishments, and some of the best stock now in England was raised by him. It is said by English horse critics that he looked for size and bone in the selection of his horses rather than for the more modern "fashionable" horse. Whether it was an acquired taste or not we cannot state, but up to the last fifteen years he was a fair horseman, and could follow the staghounds with the most reckless crack-brained riders, but since about 1850 failing health caused Baron Rothschild to desist from such manly sports.

—Mr. Frank Buckland gives an account of a visit paid to Grimsby, and tells us that from this place, largely interested in fishing, no less than 36,300 tons of fish were shipped last year, principally cod, worth £540,000, the ton of fish

averaging about £15. There is an interesting point in this article in regard to fish which Mr. Buckland calls "sprangs," which he thinks are the young of the cod, and he purposes to settle this question by placing some of the sprangs in the Brighton aquarium. These fish are small, averaging 15 inches in length and weighing two pounds, comparatively worthless as food, being worth some half a dollar of our money the thirty fish. Mr. Buckland thinks if they are young cod they should be protected, or ought not to be caught until they attain a proper size. It would be interesting to have some of our fishermen or ichthyologists give their opinions on the subject in regard to the appearance of our young cod.

—Mr. A. Spalding, of the Boston Base Ball Club, is noticed in the English papers as being now in London. We think Mr. Spalding is desirous of showing our English friends the nature and character of our American game. We are pleased to state that the cricket authority of a leading English paper, *Land and Water*, expressed the hope that the Boston club will be kindly received, and with the same cordial reception that has always greeted their countrymen who have crossed the Atlantic on similar occasions.

The Kennel.

SETTERS CROUCHING vs. POINTERS.

EDITOR FOREST AND STREAM:—

It is a singular fact that in England setters used to crouch or set their game, while in America they almost invariably point it erect and standing, or partially so, as does their companion of the chase, the pointer.

"Frank Forrester," in his "Field Sports," remarks: "In America wherever I have shot, East or West, in Canada, or in the States, I have but twice in five and twenty years seen a setter *set*, and then it was accidental, so far as this—that the dog usually stood." He speaks of having shot over a dog, both in England and America, which he broke in the old country and says of him: "I do not think I ever saw him point in his old country; I know I never saw him set in his new," and concludes by saying: "I should like vastly to arrive at something concerning this strange point in Natural History, but it defies conjecture."

I shall not pretend to fathom this intricate question, but will merely put forth an opinion which may in a slight measure go toward answering it. In England great pains is taken in the breaking and training of setters, vastly more so than in America, and while the owner of the dogs is not able to shoot over them, and seldom he is not, he has them regularly worked and practiced by his professional breaker and gamekeeper whose business it is to see that not a point in their careful training shall be lost for want of use.

Setters in England draw on their gamesplendently, and this is particularly looked to and the necessity of great caution in this act is impressed on the canine mind. Is it not natural, then, that a setter originally in his unimproved state a spaniel and taught to crouch should set his birds where carefulness has been so drilled into him?

In America we are content to have a dog that will find his game nicely, point and retrieve, and back his companion's point. This is all that is absolutely necessary to us Americans; every person here is to a great extent his own breaker, and we have no gamekeeper to educate our setters while we are occupied at our factories, counting houses, or warerooms. Again, may it not be that the setter "Frank Forrester" speaks of as having been a croucher while in England and a pointer while in America, having been hunted with a standing dog in this country, learned that crouching was not necessary, and followed the example of his companion? Dogs are very imitative. It is folly to suppose, as I have heard, that the atmosphere or the peculiar scent of our American game causes this transformation in the habits of the English trained setter when hunted here.

It cannot be said English dogs were stancher in their crouch than ours are in their stand; but certain it is we do not pay that attention we should to the breaking of setters, and I fear we are not in a condition just at present to compete for honors in a trial in the field until we know the rules of working dogs in the field. I have myself seen but one perfect croucher in all my travels (there may be hundreds more). He was notably so, and was owned and trained by a careful and particular amateur breaker, Dr. Henry Tradell, and the dog "Rake" of the Gilder-sleeve strain; none of his ancestors have the same characteristic, which is some argument that training had a great deal to do with it. I once shot woodcock over him in Bartram's thicket, in the Twenty-seventh Ward of our city, when he invariably crouched in his point, with belly on the ground and flag tail erected high and plainly visible. "Homo."

Crouching in the setters instead of pointing is easily accounted for. When Frank Forester used to shoot in England, which is now some thirty odd years ago, some of the breeds of setters used to set or crouch instead of point, simply because the setter of that period followed the natural instinct of his ancestors. Some hundred years ago or more the setter was invariably called the "setting spaniel." The difficulty of accounting as to how the setters of to-day attained the method of pointing has puzzled the best naturalists, breeders, and sportsmen of the world. Stonehenge says that Daniel, in his "Rural Sports," vol. ii., p. 290, gives a copy of a bond, signed by John Harris October 7, 1485, in which he covenants to keep for six months and break a certain spaniel to "set partridges, pheasants, and other game in consideration of ten shillings of lawful English money." Thus it can be shown that as early as the fifteenth century a dog similar to a spaniel, and therefore not a pointer, was used for setting game, and there is reason to believe that at that time, and for a long period subsequently, the setter did actually *drop* and not *stand*, as the pointers now do; but how this change was effected we do not exactly know, though there can be no doubt of the fact. Prior to the introduction of the net gun it was impossible to shoot birds flying, and these dogs were used in aid of the net which was drawn over both dog and game, and hence a crouching setter was more useful than a standing pointer; but when the gun came into general use the pointer, from being more visible as he kept his upright posture, was selected in preference, and the setter rejected, until in course of time certain breeds of that dog were known to imitate the pointer in the standing position, and after a still further lapse of time the old crouching style of setting was lost. Thus, we believe, it came to pass that the English setter imitated the pointer, but whether it was effected by crossing with the pointer it is

difficult to say. We know now by experience that the first cross between the two, commonly called "a dropper," is a useful dog, possessing the properties of each, but it does not answer to go on breeding from it, either on the side of the sire or dam, and therefore, judging from analogy, the effect has not been produced in this way

MARLBORO, MONMOUTH CO., N. J.,
February 23, 1874.

EDITOR FOREST AND STREAM:—

I am very happy indeed to learn that our English cousins have kindly consented to bring their dogs over here for the proposed trial, as many now on both sides will have an opportunity to witness and enjoy the sport that would otherwise have been deprived of the pleasure.

Our Western prairie country is preferred by those gentlemen. I believe, to test the skill of the competing dogs. It undoubtedly affords ample ground and game, but in my humble opinion not the most difficult in some respects to thoroughly test the good qualities of the dogs. Now I think more broken, uneven country, with thicket or heavy covert of some kind, where game would be more likely to elude the keen scent or activity of the dogs would be better. And besides this, if at the same time a friendly trial of the marksmanship of the owners of the competing dogs was desired (and let us have both by all means), I am sure it will be more difficult shooting in this kind of country than the open level prairie. I would therefore most respectfully suggest, if convenient and agreeable to all parties interested, that a match be arranged in some desirable locality in the East—say New Jersey, Delaware or Virginia—where grouse and quail are plenty, and the face of the country such as will fully develop the good or bad qualities and management of the dogs. And then, too, this would be but simple justice to the dogs, as some are accustomed to hunting over and broken for one kind of country, and others for an entirely different kind. I sincerely trust, therefore, our distant friends will be induced to try their dogs in both sections of the country, and thus afford many more and true lovers of the noble animal and the exciting and exhilarating sport an opportunity to enjoy it. I say this, as I fear many are situated so they cannot leave their business or families to go out West, to be gone long enough to attend the trial. I would also take the liberty to suggest the months of October or November for shooting in this country, as it will be too warm for the dogs or sportsmen earlier in the season, and in the East I think the law permitting shooting does not expire before the middle of October or first November. I think, however, in the West they shoot in August or September; but then the game is young and tame, and not near as difficult for the dogs to find or the gunner to kill as later, when full feathered, full grown, strong and wild, and will try the qualities of both hunter and dogs more thoroughly.

I have been told the shooting season begins earlier in England than here, and the summers are much cooler, and if this is so, perhaps it would be best to have the match come off there first; but in reference to other matters, others understand them better than myself, and they will no doubt be adjusted to the entire satisfaction and mutual advantage of contending parties in the forthcoming match.

I have received the portrait of "Belle," and must say I can clearly see for strength, activity and endurance she will be hard to beat. I would like to get the portrait of "Ranger" also. I am more in favor of setter dogs for our kind of hunting than pointers. Have owned and broken many of both kinds, and some first-class dogs, but at present own only one good one and not thoroughly broken yet, or I would be glad to enter the match, as I love the dog and sport better than any other animal or amusement it has been my fortune to enjoy, and have been an earnest and active sportsman for many years, and trust to enjoy many more.

"MARLBORO."

SPRINGFIELD, MASS., February 21, 1874.

EDITOR FOREST AND STREAM:—

I take a great interest in the International Trial of Pointers and Setters, and hope to be present at it. I have a good setter, but I hardly dare enter him, as there are probably many better animals.

B. F. BOWLES,
Springfield Republican.

[Mr. Price and Mr. Macdonna have left the matter entirely in the hands of the Kennel Club of England, as to the choice of dogs to represent England in the International Field Trial Challenge, but as we understand the arrangement, Mr. Macdonna will visit this country with his dogs, whether the Kennel Club selects his pointers and setters as the best field trial dogs or not.—ED.]

CHICAGO, ILL., February 19, 1873.

EDITOR FOREST AND STREAM:—

If the English gentlemen will bring their dogs on here there are many sportsmen, owners of pointers and setters, that will give them a trial on the prairies. There are some very fine dogs in this city and neighborhood. The sportsmen here are getting up a State club for the protection of game and the enforcement of the game laws. They will meet on March 10th and decide when and where the annual tournament shall take place, which I think will be some time in June.

Allow me to return you the thanks of the Prairie Shooting Club of Chicago, for information given by you, and at the same time will state that I think yours is the best paper in this country devoted to the Forest and Stream, and which I hope will be the leading paper for sportsmen.

Very respectfully,
JOSEPH BUTLER,
Sec. Prairie Shooting Club.

DO DOGS REASON—A LETTER FROM A DOG.

MR. EDITOR:—I was lying behind the stove the other evening with Pert, and heard my master reading from a paper which he appeared to be very fond of, and which, I believe, is called the FOREST AND STREAM, in which was discussed as to whether or not dogs were endowed with reasoning powers and faculties, or whether the remarkable intelligence displayed by us is an exercise only of a higher order of instinct. I listened intently, although I pretended to nod, and as there seems to be different opinions upon this subject by different persons, I thought it my duty, as one who was able to do so, to settle this question for all time.

I am a black and tan, and of pure blood, as I have often heard my master say, and I have every confidence in my master, and think he is truthful, for I have been almost constantly with him ever since three years ago, when a gentleman brought me, a little black thing not yet weaned from my mother in the great city, to the country, and my mistress brought me up on a bottle. The gentleman brought me in a ladies' band-box, and I have been with master ever since, and he always has been kind and good to me. I know that I am pretty, and don't deny that I have a fine, black, velvety skin, nice taper legs, beautiful silky ears, and slim graceful tail, and I hope I will be pardoned for thus acknowledging my vanity, but then you must know I am a female, and, besides, Pert is always telling me how nice and fine I am, and what lady can stand to be flattered without some few exhibitions of vanity. Pert is a black and tan, too, but is not nearly so pretty or shapely as I am, nor is he of as pure blood, but of course I would not tell him so, for outside of his disposition to get himself and me into scrapes he is a right good old dog, and gives me the nicest of the victuals on the plate and the warmest and snuggest place behind the stove of cold nights. But outside of all this I think I must be a valuable dog, for I heard master say that he gave \$25 for me when I was with mother, and I think \$25 must be a great deal of money, for my mistress once bought a hat which cost that much, and master appeared to be somewhat vexed, and said "you will break me up."

I like master very much, for he bought me the nicest and prettiest collar—all green leather and gold, and a place on it for "Julia" and his

name, and I always try and not to displease him, but I fear I sometimes do exhibit marks of my affection for him by jumping against him with my dirty feet after I have been digging for rats, and leaving the prints of them on his clothes. He does not like that very well, for he always says "behave, Julia, your feet are muddy," and then I wag my tail and say "very well," and walk along decently by his side.

Oh, I do love to catch rats and mice; somehow I think it comes natural for me to be fond of killing them, and occasionally Pert and I go out in the wood house and dig for them for hours at a time, and old Pert has verily worn his toe nails off at it. I very well remember the first rat I ever saw. I was about half grown, and one day went down to the barn and jumped into the corn crib, and there, oh, my! what a big rat I saw. Instinct or something told me, I don't know what, that it was my natural enemy, and that I must kill it. I pitched into it very bravely, but it bit me right over the eye, and, goodness, how the blood run, and how it pained. It hung onto me, but I was very mad, and soon shook it off and killed it. My master afterwards found the dead rat, and saw my eye bleeding, and patting me on the head called me "good dog." Since then I have learned how to do better. You may be sure I was proud of my first rat.

One day Pert and I were digging in the barn, and we dug up five of the tiniest, funniest, little bits of mice, and Pert smelt them, and I smelt them. They looked *raw*, just exactly as little canary birds do when they are first hatched. They hadn't a particle of hair on them, and, would you believe it, that old Pert actually ate two of them, the old cannibal, and I truly believe he would have eaten them every one if I had not told him I never would speak to him again as long as I lived if he touched another one of them, but I afterwards almost killed myself laughing, for what he ate made him just as sick as he could be, and I was glad of it, the old scamp. I never laughed so much in my life but once before, and that was when Mrs. Brown, who lives right across the way from us, let her hateful little poodle Capitola play in the yard, and she ran out and barked at a great big butcher's dog, who picked her up in his mouth and dropped her, with her white combed hair, blue ribbon, gold locket, and all, right into a big mud puddle in the street. I was glad of it, the little stuck up, pug nosed thing; she would run and scream if she just saw a mouse, and, besides, I don't admire her beauty; she has red eyes and—but there, I do declare, how I am going on, but I always do get excited when I think of her.

My master is very kind to Pert and me, as I said, but he does not permit us to go outside of the yard unless we are with him, for farmer Isaac has put out a lot of poison to kill the dogs who worry his sheep, and he is afraid we will get some of it and be killed; but I am sorry to say we did not always obey him, and one day he discovered Pert and me on the street coming home from one of our hunting expeditions at an old vacant house, where there were plenty of rats and mice. When he saw us he scolded us severely, and threatened, if he ever knew of our running off again, to whip us. Well, it was about two weeks after this time that I heard my master one morning tell my mistress that he was going to leave town, and would be absent for a day or two. After he left, Pert and I were lying on the stoop in the sun, feeling ever so lazy, and presently Pert looked at me and said, "Julia, let's go to the old house again and have some more sport catching rats." "Oh, dear no," I said, "Master told us never to leave the yard again without his permission; I would not think of going." "What if he did," said Pert, "master is gone, mistress is visiting over to Mrs. Brown's and Mary is away back in the kitchen; no one will know it, and besides, I saw two of the biggest rats run into the house yesterday morning as I went to market with master; but if you won't go, and will promise you won't tell on me, I will go anyhow." So I promised, and Pert started. He got as far as the gate, and beckoned "Come on, cowardly," with his tail, and I couldn't stay; so I went too. We found a big rat under a broad board, and old Pert went around on the other side of the board and barked and dug at it, and I kept right still on my side, but kept a sharp lookout until the rat ran out, and then I killed it very quickly and went to hunting more. I was very much excited at the time, and happening to look up the street who should I see but master. Oh, goodness! it frightened me so badly that I really thought for a time I should faint. I managed not to do so, and ran around the corner of the house where I had killed the rat; then the thought struck me that if I could use my wits rightly I might escape a thumping. A scolding from master hurts ever so bad, but a whipping, I think, would almost kill me; so I took the rat in my mouth when my master called me, and went up to him so sorrowfully where he stood at the gate, with my tail between my legs, just making believe, you know; and laid the rat at his feet, saying as plainly as I could, "Master, I am sorry I disobeyed you, and this is my only excuse." Master looked at me a moment, and then broke into a loud laugh, saying, "Julia, you little witch, I wouldn't strike you if you ran away a thousand times," and then he snapped his finger at me, and I galloped around him again and again, and never felt so happy before in my life but once, and that was when I had my first litter of the prettiest little black puppies, and that was the time Capitola was so angry because she never had any puppies, and besides—but there I go off the track again. Old Pert ran home through the back yard, but got a good whipping when he got there from master.

Mr. Editor, master says that you who write so well about dogs must love them, and you are liberty to publish this if you see fit, and I hope the vexed question, "Do dogs reason?" will be settled. Well, I'll declare if there isn't that hateful dog of Jones' in the yard again—boo-woo.

Yours,
JULIA.

JACKSON, Miss., February 15, 1874.

EDITOR FOREST AND STREAM:—

The picture of "Belle," the champion pointer of England, was received some time since. Accept my thanks for your kindness. Without finding fault with any one, do you not think that a full description, weight and measurements would have aided all concerned? A picture (if true) gives the beholder all the points, but it conveys nothing more; the subject may be small or of huge proportions.

How much I would like to attend that friendly match in England! I have not quite as many reasons as the historical Burgomaster had for not firing a salute on the king's arrival in his town (reasons thirteen in number; first on the list, because he had no gun, he was not an American, or he would have used an anvil). My first reason for not going is for the want of the miserable dress necessary for such an occasion.

We have a good stock of pointers here, progeny of imported English dogs, probably as good as any in this country; but all are sadly deficient in training; not one of them will drop to the shot, a point that I consider of the utmost importance in a good dog. One of our dogs here, owned by a friend of mine, the other day was trailing a covey of partridges in a field bordering on a creek with high, steep banks, to the edge of which he trailed them and stopped, throwing his nose high in the air, but the wind was blowing directly to the opposite bank, so no chance of a whiff. "Shot," then went back quartering the field thoroughly, arriving at the same point as at first, and looked at his master with a puzzled expression as much as to say, "I am beaten this time." My friend, while looking for a place to cross, heard a splashing in the water and saw Shot swimming across the creek. By the time Mr. J. had crossed he discovered his dog at a point on a covey of birds. Did Shot reason as his master did that the bird had flown across? Shot was not told to "lie over."

Bird shooting has not been good here this season. Our farmers cultivate no small grain and very little corn, in consequence I have found all the birds in the woods. Woodcock are plentiful, but usually found in the cane in inaccessible places. Snipe are just coming in. There are plenty of deer and turkeys in our woods, but I do not indulge in that sport. Ducks were unusually scarce here this winter.

We are trying to have a game law passed by our Legislature this session. Pot hunters here kill Bob White on the fence, turkeys on the nest, and does with fawn. Shall try to stop trapping birds next session; to incorporate it with the other bill would kill the whole.

I intended to answer "Cockshot" in regard to "my experience with a young pointer" some time since direct to *Land and Water*, but the copy containing the article did not reach me until last Saturday.

I have given your associate's letter in regard to fox hounds to a competent man to answer. Will forward when received. Very respectfully
Geo. C. E.

Shot Gun and Rifle.

GAME IN SEASON FOR FEBRUARY.

Hares, Squirrels and Wild Fowl.

FOR FLORIDA.

Red Deer, *Caracus Virginianus* Wild Turkey, *Meleagris gallopavo*.
Woodcock, *Philohela minor*. Quail, *Ortyx Virginianus*.
Snipe, Plover, Curlew, etc., in great variety.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

TO GAME DEALERS AND RESTAURANT KEEPERS.—We earnestly and respectfully call the attention of all persons engaged in the game business to the following sections of "An act to amend and consolidate the several acts relating to the preservation of moose, wild deer, birds, and fish," passed by the Legislature of the State of New York, April 16, 1871:—

SEC. 33. Any person may sell or have in his or her possession any pinnated grouse, commonly called partridge or quail, from the first day of January to the first day of March, and shall not be liable to any penalty under this act, provided he proves that such birds or game were killed within the period provided by this act, or were killed outside the limits of this State, at some place where the law did not prohibit such killing.

This law will be strictly enforced after the first of March, and prosecutions will certainly follow its violation.

—The Southside Sportsmen's Club of Long Island held its annual city meeting for the election of officers for the ensuing year last week. The following gentlemen were elected:—President, John K. Hackett; Vice-President, Geo. Griswold; Treasurer, William M. Johnson; Secretary, Samuel Shaw. Executive Committee:—Two years' term, Samuel Shaw and F. S. Stallknecht; one year's term, Joseph Allen and Charles Banks. It appears, from the Treasurer's report, that up to this date \$126,000 have been expended on club houses, streams and buildings, all for the purpose of fostering open-air recreation and manly sports. The constitution of the Club provides for a limitation of members to 100. Gentlemen wishing to join will have to wait until vacancies occur, as the Club is already full.

—The following amendatory act has been introduced into the Assembly by Mr. Prince, read twice, and reported favorably upon. It is now before the Committee of the Whole:—

The People of the State of New York, represented in Senate and Assembly, do enact as follows:

SECTION 1. The tenth section of chapter seven hundred and twenty-one of the laws of eighteen hundred and seventy-one, entitled "An act to amend and consolidate the several acts relating to the preservation of moose, wild deer, birds and fish," is hereby amended so as to read as follows:

§ 10. No person shall kill or expose for sale, or have in his possession, after the same has been killed, any robin, brown thrasher, meadow lark or starling, save only during the months of August, September, October, November and December, under a penalty of five dollars for each bird; and in the counties of Kings, Queens and Suffolk, no person shall kill or expose for sale, or have in his possession after the same has been killed, any of said birds in this section named, except during the months of October and November, under a penalty of five dollars for each bird.

§ 12. This act shall take effect immediately.

—A party of New York gentlemen, among whom are several members of the Union Club, sailed for Florida on Saturday, where they propose to "hunt and camp out" for a period of three weeks.

—The Amateur Shooting Club, Detroit, have elected the following officers:—President, T. W. Harris; Vice-President, R. M. Baker; Secretary, George B. Mather; Treasurer, C. H. Chope.

—A full report of the Tournament, at Conlin's Rifle Gallery, Broadway, and ties shot off yesterday, will appear in our next issue.

—Benj. P. Howell, Esq., Fish Commissioner of the State of New Jersey, in response to some inquiries of ours in regard to the game in the vicinity of Woodbury, N. J., writes us as follows:—"Sporting is a thing of the past rather than of the present in this county. Game of all kinds once abounded, but with the decay of the forests, little is left but a few rabbits and an occasional covey of quails, and then the owners of the land are precluded from enjoying a vested right on account of our close proximity to Philadelphia, whence scores of gunners make excursions as soon as the season begins."

—A meeting of amateur pigeon shooters, belonging to the New Jersey Sportsman's Club, at Swedenboro', met on the 14th ult. to try a novel method of shooting pigeons from a trap. The conditions of the match were to shoot at ten birds from a ground trap, sixty yards boundary, 1½ oz. shot, fifteen yards rise; each man to pull his own string. All ties to be shot off at an increased distance of five yards. The following is the score:—

T. W. Clark, 1, 1, 1, 1, 1, 1—6.

R. Clayton, 1, 1, 1, 1, 0, 1—5.

W. Ford, 1, 0, 1, 1, 1, 0—4.

H. Lamb, 1, 1, 0, 1, 0, 1—4.

Geo. Reed, 1, 1, 1, 1, 0, 1—5.

J. French, 0, 1, 1, 1, 1, 1—5.

M. Featherer, 1, 0, 1, 1, 1, 0—5.

J. Featherer, 0, 0, 1, 0, 1, 1—3.

G. Sheets, 1, 1, 1, 1, 1, 1—6.

Wm. Ford, 1, 1, 1, 0, 1, 1—5.

The sweep stakes were divided by Mr. Clark and Mr. Sheets, as there remained no birds to shoot the tie off.

—The Skaneateles Sportsmen's Club have elected the following officers:—President, W. F. Gregory; Vice-President, George Rawlins; Secretary and Treasurer, Asa L. Sherwood.

—The "Act to Amend and Consolidate the several Acts relating to Game and Game Fish," introduced into the New Jersey Legislature and passed by the Lower House last week, provides for killing deer only between the 15th day of October and the 1st day of November. Penalty for violation, \$50.

No person shall kill any wild duck, brant or goose with a swivel or punt gun, or with any gun other than such guns as are habitually raised at arm's length and fired from the shoulder, or use any net or device for the capture under a penalty of \$50.

Grass plover may be killed between the 1st of August and 1st day of January; and Wilson and gray snipe between the 1st of September and the 25th day of April. Penalty for infringement, \$10 for each bird.

Woodcock may be killed between the 5th day of July and the 1st of January. Penalty imposed, \$10 for each bird.

Quail, ruffed grouse or pheasant can only be killed between the 1st day of November and the 1st day of January. Penalty attached, \$15 for each bird killed or had in possession.

A section provides that no person shall kill any pinnated grouse prior to November 1st, 1880, under a penalty of \$50 for each bird killed; and subsequent to that time makes it lawful to kill them only between the 1st day of November and the 1st day of January, under a penalty of \$20 for each bird killed or had in possession.

Rail and reed birds can be killed only in the months of September, October and November under a penalty of \$5 for each bird killed or had in possession.

A fine of \$5 is imposed for killing at any time any insectivorous bird.

No person shall kill, catch, or discharge any fire arms at, any wild pigeon while on its nesting ground, or discharge any fire arms within one-fourth of a mile of their nesting places under a penalty of \$25.

No person shall kill or take any ruffed grouse, quail, woodcock, pinnated grouse, rail, or reed birds by means of any trap, snare, net, or device whatever, at any time, under a penalty of \$10 for each bird so snared or taken. A provision in this section makes it lawful to take quail by means of traps between the 1st of January and 1st of July for the sole purpose of preserving them alive over the winter.

No person may catch any speckled trout, bass or salmon, or any other fish, in any of the fresh water in this State, with any device, save only with hook and line, or place any set lines in any water inhabited by them under a penalty of \$25.

It is lawful to catch salmon, speckled trout or bass only in the months of April, May, June, July, and the first fifteen days in August under a penalty of \$10 for each fish had in possession; but this section does not prevent any person from catching trout with nets on waters owned by himself for the purpose of stocking other waters.

A section provides that no person shall kill or expose for sale any salmon trout, lake trout, or bass in the months of October, November, December, January, and February, under a penalty of \$10 for each fish.

It is not lawful for any person to place any set nets across any of the canals, river lets, thoroughfares, or creeks in this State under a penalty of \$25.

No person or corporation shall throw or deposit any culm or coal dirt into or upon any of the rivers, lakes, ponds, or streams under a penalty of \$50; and any person placing any lime, or drug, or medicated bait in any fresh water stream, lake or pond stocked with or inhabited by salmon, trout, bass, pike, pickerel, sunfish, or perch, is liable to a fine of \$50 and damages in addition thereto.

No person shall catch any black bass, pike or pickerel between the 1st day of March and the 1st day of June under a penalty of \$25.

Any Justice or Magistrate having probable cause for believing in the concealment of any game or fish during any of the periods prohibited, may issue his search warrant, and cause search to be made in any house, market, boat, package, car, or building.

EDITOR FOREST AND STREAM:—

An amateur pigeon match was shot last week on the grounds adjoining Mr. Robert Gordon's Hotel, Forty-seventh street and Baltimore avenue, West Philadelphia, with field guns, 1½ oz. shot, 21 yards rise, 80 yards boundary. The birds proved all "drivers," and were "little blue rocks." The following is the score:

	Killed.	Gun used.
R. Gordon.....	0 1 0 1 1 0—3	Scott gun, 8½ lbs. 10 gauge.
Geo. Twadell....	0 0 1 1 1 0—3	Parker gun, 8 lbs. 12 gauge.
Mr. McMiller.....	0 0 1 1 1 1—4	Scott gun, 8½ lbs., 10 gauge.
C. S. Westcott.....	0 1 1 1 1 1—5	Moore gun, 7½ lbs., 12 gauge.

This was the first of a series of friendly matches between the "Saterlee Heights few." A challenge has been given to the winner of the match—of which more anon.

MEMPHIS, Tenn., February 15, 1874.

EDITOR FOREST AND STREAM:—

At a special meeting of the Bluff City Shooting Club it was decided to have a handicap match at single birds. Three elegant solid silver cups are to be awarded as prizes for the first, second and third best shots. It was also unanimously agreed by the Club to have a live deer chase on the same day, February 26th. Three prominent and well known gentlemen, citizens of Memphis, have entered their pack of hounds for the grand chase. The Club boys, it would appear from the above, are fully determined to have fine sport. The match and chase will take place at the Chickasaw Jockey Club Course. Yours,
JOE.

HAMILTON, Canada, February 20, 1874.

EDITOR FOREST AND STREAM:—

As it may interest your readers to know what is going on this side of the line in the way of rifle shooting, I take great pleasure in giving you what scant information lies in my power. For some time back the small bore men of Canada, or rather Ontario (but I think it will apply to all the provinces), have felt that they have not received that recognition or support from the different rifle associations which they are entitled to. They consider that they have been the organizers of the popular feeling which now exists all over Canada for rifle practice. They have felt quite aggrieved (and not without reason) that the heads or managers of the different associations, who are nearly all gentlemen belonging to the militia or volunteers, confine their matches to military rifles and ignore the small bores entirely, with perhaps some few exceptions, where one or two matches for small bores out of perhaps twelve matches for the Snider or Military rifle were shot for, and those one or two were simply put in the programme to insure the attendance of small bore men, knowing that they would be almost sure to shoot in all the matches. Such being the case, some of the small bore men have taken the lead in organ-

izing an association of their own, and have called a meeting of those who were willing to aid in getting up an Ontario Small Bore Rifle Association. A meeting was held in the Temperance Hall, Toronto, on Thursday of last week. There was a good representation from different parts present. J. B. Boustead, Esq., was called to the chair, and Mr. Cruet acted as secretary *pro tem*. After some little discussion of no moment, it was proposed, seconded and carried unanimously that a Small Bore Rifle Association should be formed, to be called the Ontario Small Bore Rifle Association. A committee of five were elected to draw out rules and regulations and to report to an adjourned meeting to be held on March 17th, a report of which I will send you if I am present. I am happy to see by your interesting FOREST AND STREAM that the Amateur Rifle Club of New York have made arrangements for a friendly competition at Creedmoor with an Irish Club. I hope that we of the Victoria Rifle Club of Hamilton may have an opportunity of testing our steel against them on some occasion. We had a similar match with the Bristol Club of England, who were the champions at that time, and we beat them. I trust we will be able to give our Irish brothers a pretty good shake, if an opportunity occurs. I am, dear sir, Yours,

SHOOTER.

TORONTO, February 23.

EDITOR FOREST AND STREAM:—

Our club, the Toronto Gun Club, has almost been disbanded or broken up since I last wrote to you on account of those dissatisfied members of whom I spoke, though now we have got into first class working order.

The list of our officers and our club rules and constitution will be sent to you by our secretary, who will also acknowledge reception of the two plates of the celebrated pointer Belle, which you were kind enough to forward to us.

We have instituted a series of matches, which are to take place each month; the prize for each match is a case of stuffed birds, (game.)

A few of our members inaugurated these shoots last week. The following are the handicapped:

Yards.	Names.	Handicapped.	Total.
16	R. Morrison	1 0 1 0 0 0 1 1 0 0	4
18	Jas. Ross.	0 0 0 0 1 0 1 1 0 1	4
17	J. Maughan.	0 0 0 1 0 1 0 0 1 0	3
18	C. Way.	1 1 1 0 0 1 1 0 0 0	5
18	J. Morrison	1 1 0 0 0 1 0 1 0 0	4
18	A. McGregor	1 1 1 1 1 1 1 1 1 1	10
18	C. Pickering	1 1 1 1 0 1 0 0 1 1	7
21	J. Taylor	1 1 0 0 0 1 1 1 1 0	6

The birds were the liveliest lot of snow birds I ever saw, and with a stiff breeze blowing from SSW. So in consideration of the day the score was not so bad.

—Captain Bogardus is backed by Richard Kendall of Chicago, for \$1,000 to \$5,000 to shoot one hundred pigeons against any other man in the United States, all birds to be trapped from the same cage.

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

REPORT OF THE FISHERY COMMISSIONERS OF MASSACHUSETTS FOR 1873.

MESSRS. THEODORE LYMAN, E. A. Brackett and Asa French, the Commissioners of Inland Fisheries of the commonwealth of Massachusetts furnish us with a well prepared report of the fishing interests of the State confided to their care for the year 1873. Commencing with the well known case in dispute of the Commonwealth vs. the Holyoke Water Power, finally decided in favor of the State, it is with pleasure that we find according to the statement of the commissioners, that the company have given these gentlemen their fullest co-operation and that the plans and details of the fishway for the dam, so far as finished have been faithfully carried out. Next summer it is proposed to build a fishway at Turner's Falls, which it is hoped will remove all obstacles to the passage of fish up the river. Massachusetts is so situated with rivers finding their mouths in her sea-board, and flowing through other States, that on her depends in no small measure the success of pisciculture in other sections north of her. In this interest the commissioners of the New England States voted at their last meeting to deposit all the young salmon, hatched by them last year, in the head waters of the Connecticut. In addition many millions of young shad are to be carried this coming summer above Turner's Falls. From the suggestions of Professor Baird, (found in a characteristic letter of this most distinguished of our ichthyologists in the appendix) is shown the necessity of furnishing food for the cod, haddock and halibut, which food is the alewife (*Alosa tyrannus*) and how the anadromous fishes bring the cod and other fishes to the coast because these purely sea fishes find in anadromous fish their food. The commissioners have then very wisely paid attention to the introduction of alewife. In addition to furnishing food to the sea fishes, rendering coast fishing possible once more, the alewife is quite a good fish, in flavor scarce inferior to the shad, its only objection being an over abundance of small bones. Of the shad hatching undertaken by Mr. A. C. Hardy, we have a most elaborately prepared synopsis, showing in a series of carefully prepared tables, the number of male and female shad taken, the temperature of the air and water, meteorological circumstances, and with it the quantity of spawn collected. From the exceedingly large number of fish taken, some 2,691, no less than 11,595,000 ova were obtained, which ova in part were hatched and turned into the Merrimack, the Neponset, and Monataquot Rivers. In addition to this on the Connecticut River, under the same careful series of observations, innumerable shad ova were secured and hatched. Of course though shad are becoming more and more plentiful in the New England States, it may be three years yet before we shall hear of the return of these fish to the rivers, grown sufficient size to be

marketable. Of smelt the commissioners state that twenty-five years ago the lower waters of the Mystic River were in the winter season crowded with little tents for the protection of persons engaged in fishing, and that two to three dollars could be made a day by men catching smelts with the hook and line, but that later the seining and netting on the spawn beds had destroyed the fish, and consequently the gains of the fishermen. So completely was this the case, that a fish committee from Winchester spent several nights in catching only fifty-two smelts, their object being to stock the river above Mystic dam. But through good care and judgment and by more carefully protecting this excellent little fish during the last five years, so rapidly have the smelt increased, that last winter the little tents made their appearance once more, and the fishing business for smelts became again lucrative. Seven eighths of the supply of Boston market in smelts now come from Greene Bay, near Portsmouth, and are caught by hook and line, and the commissioners very pithily remark "no man would venture upon Green Bay with seine or net unless he believed in baptism without benefit of clergy," which little bit of piscatory lynch law if meted out occasionally, we should be inclined to say would bring forward the verdict of "serve 'em right," from all true friends of fish protection. Of trout propagation, the commissioners inform us that quite a number of establishments have been started in the State during the past year. The report states that to ensure success the preserve should be a flowed pond of many acres with deep and shallow water, that grass, bushes and trees should not be removed, because they serve to enerate insects, flies &c., which ought to form half of the natural food the fish should use. The pond owned by D. H. Gilbert & Son, of Plymouth, intended for trout culture, the commissioners declare to be a move in the right direction.

Of the salmon spawn raised in Maine by Mr. Charles G. Atkins, (see an admirable paper on this subject by Mr. Atkins in the last issue of the FOREST AND STREAM). Massachusetts received 232,800, about 185,000 healthy young fish were obtained, and of these 165,000 were placed by the New Hampshire Commissioners in the head waters of the Merrimack at Woodstock and Thornton, and by other additions the total number of young fish amounted to fully 185,000. There is now no doubt but that some of the salmon of 1871 have made their appearance in the Massachusetts bay, as we are informed that fish of two and three pounds have been caught in gill nets used for mackerel. Last summer one of eight or nine pounds was caught near Boston, and in Buzzards bay in July 1873 it is pretty certain that a salmon of eight pounds was captured. These facts show quite positively that the few young salmon placed in the rivers some three years ago, true to their nature after having gone to sea are returning. This spring the commissioners believe their share of young salmon to be put into their waters will be fully 600,000. Of the *Salmo Quinnet*, Sacramento salmon, some 48,000 eggs were obtained, from which 27,000 young fish were produced. A further supply is expected by the commissioners, which they propose placing in two small rivers, in order to study their growth and habits. Of land locked salmon the commissioners of Massachusetts united with those of Connecticut in forming a hatching house at Ship Pond Stream, one of the tributaries of Sebect Lake, and as soon as in order a fair stock of spawn may be expected, to be distributed in the States.

Of fishways, one of the most important subjects in pisciculture, and one involving the greatest trouble and expense, the commissioners have planned and ordered eighteen during the last year of which fifteen have been completed including the one before mentioned at Holyoke, and we have the assurance that this spring all of them will be completed. One most interesting chapter in the report, is that treating of the Leased Ponds, in accordance with the passage of an act of 1869, and under authority of an additional act granted in 1873 twenty-six great ponds have been leased by the commissioners for the cultivation of fishes, and of these four to the towns near which the ponds are located. Under certain carefully prepared leases, when a town appropriates money to stock a pond, every citizen of the town has a direct interest in the success of the enterprise. Sufficient time has not yet in every case elapsed so that the benefits of the system can be fully judged, but enough has been ascertained to demonstrate its success. Appendix B. (Page 30) of the report is a most interesting document, referring as it does to the condition of the leased ponds; the advantages of the plan can be readily seen; from the testimony of those leasing the ponds, in every case the fish have thriven wonderfully, and the new stocks introduced into them seem to promise exceedingly well for the future. The report concludes with a thorough review of the lobster question, given by a Boston firm, where the same reasoning is carried out, for the preservation of lobsters, as was mentioned by us in former reviews. The total expenses of commissioners for the year have been \$4,056.37, which small amount of money, we believe to have been carefully and judiciously spent. We have every reason to be well satisfied with the report of Messrs. Lyman, Brackett and French, of the Massachusetts Fish Commission, as it evinces not only care in its preparation, but may develop new facts from a study of the tables showing the effects of temperature of the air and water, and weather on the spawning of fish.

—Mr. J. S. Robinson, at Meredith Village, New Hampshire, has some 40,000 young lake trout, just hatched at his fish nursery, with which he proposes to stock Lake Winnipissiopee.

FISH PROTECTION IN MAINE.—The work of introducing sea-fish into the rivers of Maine, and hatching spawn for other States, undertaken six or eight years ago, has proved remarkably successful. There has been a good deal of opposition to the erection of fish-ways and the laws against throwing the waste of mills into the streams, but it has been partly overcome, and already the Penobscot and Kennebec are well stocked with salmon, while the Androscoggin has received a large lot of young fish. The catch of salmon on the Penobscot since the work began is estimated at 15,000, worth \$50,000, while the whole gain from the efforts of the commissioners cannot be less than \$100,000. But the work of breeding shows the most remarkable results. Mr. Atkins, one of the commissioners, bought the first eggs in Canada at \$44 80 per thousand, or nearly 4½ cents each; now he sells the same sort at \$3 50 a thousand. He has in five troughs 2,500,000 eggs, and can increase the number to 4,000,000. The hatching of shad is a minor industry, and 100,000 young ones have been placed in the Kennebec, and the same number in the Penobscot, the past year.

—The recent meeting at Little Falls, for the purpose of stocking the Mohawk River with fish, was largely attended and resulted in the appointment of a committee to solicit subscriptions, a committee to receive and take charge of the fish and to visit Rochester for the purpose of obtaining from Seth Green the necessary information for the success of fish culture.

In the Maine Legislature a bill was reported from the Committee on Fisheries, which amends the present statutes so that any person who shall have in his possession any fresh salmon between September 1st and April 1st, or any fresh land-locked salmon or trout between October 5th and January 1st, which he has obtained by gift, purchase or in any other way, is to be held liable to the penalties of the law. The bill was ordered to be printed.

CLEVELAND, OHIO, February 16. 1874.

EDITOR FOREST AND STREAM:—

I notice in your list of Fish Commissioners for several States, that you have not those of Ohio. They are as follows:—

E. Sterling, M. D., Cleveland; J. H. Klippart, Columbus, J. H. Warder, Cincinnati. They were appointed by Gov. Noyes in pursuance of an Act of the General Assembly passed in 1873. Under the law, the Commissioners made a report, and Gov. Noyes, the retiring governor, in his annual message, said as follows:—

"When laborers are out of employment, when times are hard and money scarce, the minds of men naturally and properly turn to the consideration of matters affecting the price of subsistence, the cost of living. Certainly there is no food more healthful or more palatable than the best varieties of fish which are found in our lakes and rivers. Yet the supply has been growing less year by year, until it can no longer be regarded as a common and cheap article of diet, but should be classed with the luxuries, which only the rich or those in comfortable circumstances can afford. It is no longer a question whether or not it is possible to restock our inland waters with fish. Experiments in various parts of the country have been made on so generous a scale, that it is now certain we can repair the waste and consumption which have produced the present scarcity. And this can be done with comparatively little cost. The delicious white fish of the lakes, instead of costing ten cents per pound, as they now do when placed upon our tables, ought to be afforded for four cents at most. But to effect this there must be a more plentiful supply.

The General Assembly, at its last session, authorized the appointment of three fish commissioners, who were to act without compensation, but whose actual expenses while prosecuting their investigations were provided for by a small appropriation. These commissioners were not expected to undertake the actual work of fish culture, otherwise a larger appropriation would have been made. The board are now ready to commence restocking our waters, and are satisfied that an almost unlimited supply of fish can be furnished, within three or four years from the time when the work is entered upon in earnest. In the interest of both comfort and economy, I recommend an appropriation of at least \$5,000, for the purpose of erecting hatching houses on Lake Erie, in our reservoirs and rivers, and to pay the expense of propagating the most desirable kinds of fish."

Whether the recommendation will be headed by the present General Assembly, remains to be seen. The chances are that it will not, for I observe that a bill has been introduced to repeal the law of 1873, and thus a backward step is to be taken, instead of one forward in the right direction. Nevertheless it will be only a question of time, when the subject of propagation of fish will revive due attention in this State, as public attention is being directed to it more and more every year.

Our lakes, reservoirs, and rivers can be easily stocked with an abundance of good fish, and then, "cheap food for the millions."

Yours Truly,

ALLAN T. BRINSMADE.

[If the waters of Ohio are not speedily restocked with fish, it will not be through the neglect or indifference of Governor Noyes. He evidently appreciates the importance of the measures which he recommends, when he urges an appropriation of at least \$5,000. The appropriations of most of the States are too meagre to accomplish much, and not at all commensurate with the grand results sought to be obtained. When we know that the judicious planting of fish ova will yield returns many fold greater than the seed corn that is put into the earth, it is penny-wise for Legislatures to be parsimonious in the appropriation of the public money for the use of the Fish Commissioners. We trust that the present General Assembly of Ohio will be taught to attach such importance to the measures recommended by Geo. Noyes as they deserve.—Ed.]

Boston, February 23, 1874.

EDITOR FOREST AND STREAM:—

I can hardly believe that Seth Green wrote the article which appeared in the New York Times over his signature on the subject of lobsters. Mr. Green is made to say "they will not have any lobsters in a few years, if they allow them to be taken during the spawning season." Is Mr. Green aware that lobsters spawn at all seasons, and that it is not known at what season the greatest amount of spawn is thrown? (See Mr. Johnson's report, made to the Massachusetts Anglers' Association). In closing the letter referred to, Mr. Green says it is easy to propagate lobsters, and advises us as follows:—

"The pond should be built in some place where the salt water sets in from the ocean, and should be screened in such a way that the water can flow in and out with the rise and fall of the tide. I think, also, that it should be fenced on the seaward side, and possibly all around, so as to prevent the lobster from going over the land to the ocean."

Mr. Green fears that the lobsters might possibly escape from the pond by going overland! His fears may be well founded, but judging from a slight acquaintance with lobsters I should not be unwilling to match an Ontario white fish against the fastest land travelling lobster ever seen by the greatest of modern fishermen, particularly if both were to come out of the water of their own accord to participate in the race.

As Mr. Green has given his advice in regard to the propagation of this useful article of food, will he not kindly give us such facts as he may possess regarding their land travels, where they came out, how far they went and what they came out for, and how long they lived after they came out.

—The New York Canoe Club held its third annual meeting at their Club rooms on February 19th. The rooms were filled with members, many of them being the leading literary and scientific men of this city, who have employed their leisure hours in voyages of discovery on the upper waters of Lake Champlain and the charming River Sorrel, which empties into this beautiful Lake. Commodore Schuyler took the chair; when the Treasurer read the financial report of the past year, which showed that the prosperous condition of the Club was very encouraging; the Secretary's report was also read, and the officers of the past year received a vote of thanks. The members proceeded to ballot and elect officers for the year. The following gentlemen were chosen:—Commodore, W. L. Alden, Vice-Commodore, G. Livingston Morse; Hon. Secretary, M. Roosevelt Schuyler; Treasurer, S. Grosvenor Porter; Corresponding Secretary, Lewis F. Timmerman; Measurer, A. Carey Smith. The Club has now some twenty-five canoes, most of them built from a design after the model of W. Baden Powell and a few Rob Roy's.

SHOOTING AND YACHTING.—The amateur sportsmen of Quincy, Mass., are agitating the question, with prospects of success, of forming both a Pigeon Shooting and a Yacht Club in that town. There is plenty of good material for both organizations.

THE BOSTON YACHT CLUB.—Vice-Commodore McKee, of this Club, has purchased the yacht Posy, cat rigged, 24 ft. long, on which he will fly his badge of office the coming season.

INTERCOLLEGIATE REGATTA.

CORNELL UNIVERSITY, ITHACA, N. Y., February 21, 1874.

EDITOR FOREST AND STREAM:—

I have noticed several articles in the back numbers of FOREST AND STREAM in regard to the decision of the convention of the Rowing Association of American Colleges to hold the next regatta at Saratoga the 16th of July next, and some of them contain so many of what I shall call malicious statements that I should like to say a few words on the subject. It is recognized as parliamentary to call any body together when it is desired by the members of the association, or when any important business is to be brought before them.

Now, no one conversant with college regattas will deny but what it is necessary to have as much time as possible in which to prepare for the contest, having all preliminaries well understood beforehand as far as possible. That there is not sufficient time after the 25th of March to complete all arrangements was well shown last year, and it was this fact which induced some of the parties interested to desire an early meeting, at which to decide these matters, which all crews desire to know before going into training.

It is also, I believe, parliamentary that when such meeting has been called by the proper officers, and authorized by vote of the governing body, as was the case at Hartford, it becomes constitutional, and all action which may occur at such meeting is valid. The meeting then being constitutional, how can fault be found with the selection of a place for the regatta, since it has been known from the date of the last regatta that some place for this year would be selected at some future time? And as all eligible places for holding a regatta have been before the association a long time—Saratoga since the spring of 1873—and more or less fully discussed by the college papers, their pros and cons, good and bad points, fully set forth, therefore the charge of haste in selection cannot be stained.

But how are the evil results, which are so freely predicted, going to follow? Why should they follow the location of the regatta at Saratoga rather than at any other place in America? Our fathers, mothers, brothers, sisters, relatives, and friends throng to Saratoga every year, spend the summer there, and return uncontaminated by the vices which are now held up with fulsome talk before the imagination of collegians as sure to infect us if we go there. Pie on such mandling. Just as if the mere fact of being at Springfield, New London, Troy, or Saratoga would make a fig's difference as to the gambling, betting, drinking, and vice generally which is set before the students at the regatta.

Will John Morrissey turn over his little finger for all the profits that will accrue to him from the crews themselves, or from the friends and visitors who are there for three or four days? His game is the wealthy fashionable who throng Saratoga during the entire summer, and who have too few brains to control their bodily actions and save their money. It is a question whether the majority of collegians could even gain admission to his rooms during their brief stay. What will attract gamblers, black legs, and pool sellers there more than usual when they will not be allowed near the course by the Saratoga Rowing Association and the officers in charge? Truly, there is nothing like a desire to find fault, which enables one to see so much in nothing.

Springfield was crowded with gamblers, black legs and extortioners of every kind last year, and yet the very parties who now taboo Saratoga would be glad to see the regatta again at Springfield, and would doff the sackcloth and ashes of the Springs for the purple and fine linen of the river. But is there not a very serious question underlying all this fuss and humdrum? namely:—Do Amherst, Dartmouth, etc., place persons in their crews who are so fond of gambling and debauchery that they cannot be trusted where the very best society of our country allows its sons and daughters to congregate? Is their training no restraint? Is their bringing up no guarantee of sufficient self-restraint to withstand these temptations? If so, then brand them at once as children, and send their nurses and their mother's apron strings along with them that we may know whether we are dealing with young men or not.

Repeat our decision to go to Saratoga? And why? Last year the Amateur Regatta was held there, and was pronounced, by those competent to judge, the best of the kind ever held in this country. There was no rowdiness, drunkenness, pool selling, blacklegism, it being far ahead in every respect of the regatta which afterward took place in the staid, Quaker city of Philadelphia. In regard to the distance, it is nearer central for all the colleges at present represented in the association than any other suitable place that could be named.

The following is a pretty accurate list of the distances from the various colleges to Saratoga:—Bowdoin, 352 miles; Cornell, 239; Harvard, 230; Princeton, 221; Yale, 200; Dartmouth, 200; Amherst, 188; Columbia, 176; Wesleyan and Trinity less than Yale, and Williams only a comparatively short distance.

Bowdoin has the greatest cause to complain on account of distance, yet she voted for Saratoga. Cornell last year went 353 miles to Springfield, and found no fault with the distance, and even now she has to go farther than any other college or university except Bowdoin. In my opinion—if so humble an opinion is of any account—the association did well in every regard in selecting Saratoga. It is central, easy of access, no more costly than Springfield, and an almost perfect course. Because Amherst could not have her own way is no reason why she should find fault with the place and back out. As well might the two who voted in the negative last year have pointed to the holes of Springfield and refused to go there. If men and money were lacking, which is surmised by many of the colleges and universities, it would have been much better to have kept quiet, and simply been *non est* at the regatta. If this last is not the fact we trust that Amherst will rescind her childish action, and, acquiescing in the decision of the association, as Harvard has done, send a crew who shall have manhood sufficient to withstand the temptations, if any, of Saratoga, and prove to the world that Amherst is not a breeder of milk and water specimens of humanity.

We reiterate, then, we are glad Saratoga was chosen, because we have every reason to believe that everything will be conducted fairly and uprightly. And, more than that, we of Cornell believe that with a fair, open course, we can come in better than fourth, as we did last year, although we had a mile of shoal to tug over; at least we shall do our best to send as good a crew as any on the lake. Last year our crew received the title of the "Wicked Crew," because they rowed on Sunday instead of staying on shore playing, cleaning their boat house, fixing their boat, etc., as all the other crews did. Perhaps at Saratoga they may be able to redeem their reputation.

Since writing last we have enlarged the navy boat house, so that it will now accommodate twenty or more boats with ease, leaving two large rooms for dressing and oar rooms. It is quite convenient now, and everything is in readiness for hard work as soon as the water opens in the spring. The gymnasium, built by the professors and students, will soon be ready for use. It is 20x50 feet on the ground, and twenty feet between joints, and will contain all the apparatus with which the best college gymnasiums are supplied—that is, the practical apparatus—two sets of parallel and perpendicular bars, two horizontal bars, peg-pole, rope, horse, spring board, trapeze, dumb bells, clubs, rings, and a reactionary lifter.

We have had a few days of good skating during the past cold snap, but the snow has spoiled it for the present. Some of the students are trying to get a rink started, and it is to be hoped that before long we may have a permanent skating place, as there are several places in the village well suited for such a purpose.

DARTMOUTH COLLEGE, February 23, 1874.

EDITOR FOREST AND STREAM:—

Of course we are all much excited with the many *pros* and *cons* about Saratoga. Though some of the students—not rowing men—may be opposed to Saratoga on strictly moral grounds, the majority of the athletics are for it. Nevertheless, matters are not exactly settled, though there is no doubt that a good crew will pull at Saratoga. We have plenty of pluck left in us yet, and, though practice in our ships has not yet commenced, when the time comes we will set to work manfully. Gates, Eaton, Ward, and Archibald, of last year's crew, are here, and they will make a stout nucleus, and as there are some other promising good ones there is no reason, then, that Dartmouth will not make a fair showing in 1874. Perhaps an effort will be made to bring it about that a certain lusty oarsman of our college shall try a pair of sculls, so as to compete for the Bennett cup. Yours truly,

G. N.

—We are requested by the Saratoga Rowing Association to print the following card:

SARATOGA ROWING ASSOCIATION.
It is necessary for the Saratoga Rowing Association to have the address of every amateur rowing club of good standing in the United States and Canada. The Association propose to issue soon its circulars concerning its annual regatta, which will be given some time in August. Therefore it is to be hoped that all rowing clubs will send their address, giving name of President and Secretary, so that none may be overlooked, nor fail to receive circulars. Address

SARATOGA ROWING ASSOCIATION,
Saratoga Springs, New York.

Sea and River Fishing.

FISH IN SEASON IN FEBRUARY.

Pompano.	SOUTHERN WATERS.	Sheepshead.
Snapper.	Trout, (Black Bass.)	Tailorfish.
Grouper.	Drum, (two species.)	Sea Bass.
Rockfish.	Kingfish.	
	Striped Bass.	

—Indian River, Florida, a well known sporting resort, averages about two miles in width, and has a navigable channel for a distance of about fifty miles, from which point to Jupiter more or less obstructions occur, caused by oyster and conch banks. The river is so straight for one hundred and fifty miles that a straight line drawn through its centre would not touch either bank. It is a beautiful river, and is skirted on either side by a variety of lands—hammocks, savannahs and piney woods.

—The Maine Committee on Fisheries reported an amendatory act to the present law relating to illegal fishing, which provides that any officer may appropriate, without process of law, all implements used in catching land-locked salmon, trout and togue, together with the fish taken, within the months of October, November and December of each year. It provides for a hearing to claimants before a court of competent jurisdiction, if they desire to show that they have not violated the law. The bill was ordered to be printed.

—A report to the United States Commissioner of Fish and Fisheries, by B. H. Sisson, of Shelter Island, states the opinion of all engaged in the business of expressing oil from menhaden, or mossbunkers, to be that the large number of fish thus consumed, creates no perceptible diminution of the supply.

—A pond two acres in extent has just been discovered on the top of a mountain in Glastenbury, Vermont. The old people say that it was discovered once before, years ago, by two men who had some wonderful trout-fishing there, but were never able to find it a second time.

An act to incorporate the Maine Sportsman's Association was presented to the Legislature of that State this last week.

—The crews of Swampscott schooners report continued poor luck in their fishing, some of them declaring the season to be the most unfavorable ever known in that town. —An occasional correspondent in New Haven sends us the following interesting facts respecting the menhaden fishery and manufacture, which has grown of late years to a most important commercial interest. He says:—

"There are now in operation sixty-two factories in the United States employing a capital of upwards of \$5,000,000. The number of fishermen annually employed in the capture of fish is 1,197. In addition to this large force of men, 1,109 are employed at factories in converting the fish to oil and guano. Three hundred and eighty-three sailing vessels are annually employed during the summer season, and twenty steam vessels. The total of the fish catch during the season of 1873, was 1,193,100 barrels (250 fish to a barrel), and the amount of oil manufactured was 2,214,800 gallons. The total amount of guano manufactured was 36,299 tons. These statements of a business heretofore considered of little account are encouraging, as showing a new source of wealth to the country. The menhaden are good for little else as a source of profit than the object they are thus devoted to. Formerly the fish were taken in enormous quantities and thrown broadcast in a prodigal manner on the fields for manure but as the oil was thus in a measure lost, this manner of disposing of the fish was very wasteful. It has been discovered by experiment that the guano manufactured from the pumice, or refuse of the fish after the extraction of the valuable oil, is vastly better as a fertilizer than the fish themselves. The oil is devoted to many purposes. It is not used as much for purposes of lubrication as for other uses, though not entirely rejected in that service. It is well known as an ingredient of paint, being used as a substitute for more costly oils, for house painting purposes especially. It is also extensively used in ship painting. Mingled with other oils it is said to be nearly, if not fully, as well adapted to interior painting. Many of these factories are not stationary; some of them are afloat. The fish work of the Luce Brothers, at present on the Thames River, is an old railroad ferry boat, that, before the construction of the bridge across the Connecticut, was run as a ferryboat between Lyme and Saybrook. This work is towed about and anchored wherever the fishing is found to be good. The fish work of the Quinipiac Fertilizer Company, situated at Pine Island, near the mouth of the Thames River, is a good model of the average fish work. The sale of both oil and guano is constantly on the increase. The trade is little known, and we believe that a full statement of the facts and statistics of the business have never before been given to the public.

"You can add that the small fry are plenty in Long Island Sound and its harbors, commencing in June and disappearing at first frost in October, when, like the bluefish they leave the northern waters for the south, and the following season come north to spawn, which they do in April and May. The enormous catches of the last ten years have been smaller than formerly. When full grown they are taken in shoals in Long Island Sound, extending eastward to Nantucket, in shore and out. They are a surface fish, and are taken outside in purse nets by surrounding the shoal, when the bottom of the nets are drawn close by ropes, thus enclosing them. They are then bailed into the boats or tenders and sent to the factories for use. In shore fishing is done by long drag nets in shoal water. In the month of October they leave the north in company with the blue fish, and are food for them in their migration.

"Yours,

"C. F. H."

New Publications.

A SELF MADE WOMAN; or, Mary Idyl's Trials and Triumphs. By Emma May Buckingham. One 12mo vol. 300 pages; mns.-lin, \$1 75. N. Y.: S. R. Wells.

To all who are seeking to live a higher and nobler life, whose aspirations go out after the presence of an intellectual and useful career, we can fully commend this work. The heroine is a noble specimen of a self-taught, a self-made woman. In Mary Idyl's life and success, amid struggles, discouragements and disappointments that would have subdued even stronger natures, we behold triumph and success. The reader will find a strong argument in this work in favor of obeying the laws of hygiene and the hopes of the most salutary results. The loveliness of one's character is entirely different to the loveliness that constitutes beauty or comeliness of person. One is evanescent and soon fades, while the intellectual beauties of the mind, the ever-enduring, become more glorious and entrancing by age. A careful perusal of this work will give a fuller impression of its value as a reformatory work than any analysis we might further offer.

MAXIMS AND HINTS FOR AN ANGLER, with humorous engravings, to which are added Maxims and Hints for a Chess Player. Claxton, Remsen & Haffelfinger, Philadelphia.

This is an amusing brochure, containing both good instruction and pleasant reading. Just the kind of a convenient book to put in one's pocket to while away a few minutes' time when the fish won't bite, or to read seriously for fair practical instruction in the gentle art. The chapter on the "Miseries of Fishing" is a most laughable one, and "Maxims and Hints" have in addition a series of most amusing wood cuts. There is a great deal of wholesome fun, a notable amount of good instruction, and much quaint philosophy in the little book.

THE PREPARATION AND MOUNTING OF MICROSCOPIC OBJECTS. By Thomas Davis. 16mo, cloth, \$1 25. New York: G. P. Putnam's Sons.

This is a compendium of all the most approved methods of mounting microscopic objects. The information is so plainly given that almost anyone—even a lad—can gain much instruction from the author's experience. It is a rare work; just what the beginner wants. We can commend it to one and all.

ANNOUNCEMENTS.

We learn from the Messrs. Osgood & Co. that they have in press and will soon issue a work entitled "Fables in Song," by Robert Lord Lytton. (Owen Meredith.) 1 vol. 16mo.

LIFE OF THEODORE PARKER. By O. B. Frothingham. 1 vol. 12mo. 560 p. With portrait.

Sheldon & Company, New York, will publish, March 12th, the following new books:

Ex-Secretary Welles' great book, "Lincoln and Seward," their relative positions in Mr. Lincoln's Administration. 1 volume. 12mo, tinted paper. Cloth, \$1 50. Paper, \$1.

"HEAVEN IN SONG." A collection of the choicest poems of all ages on this great theme. Cheap edition. 1 volume. 12mo, tinted paper, bound in black and gold. Price \$2 50.

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

SIR:—A friend of mine sent me, with a transport
of Indian Skulls, two pounds "Vanity Fair," which I declare
to be the best Tobacco I ever smoked. We have very good
tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair"
is the King of all, by its aromatic flavor and the right sort of
strength. My friend in New York got an appointment in
California, by that reason I apply immediately to you, begging
you to send me for the enclosed ten dollars, a supply of "Vanity
Fair," and send with the next steamer to Germany. If there
is a German firm that sells your excellent "Vanity Fair," I
beg you to enclose me the address.

BREECH LOADING GUNS
A SPECIALTY.

We would call the attention of the public to our large assortment of

Breech-Loading Shot Guns,
Manufactured by the following celebrated makers:
Messrs. W. & C. SCOTT & SONS (winners at the International Gun Trial of 1873); P. WEBLEY & SON,
W. W. GREENER, WESTLEY RICHARDS, J. HOL-
LIS & SONS, and other makers.

A full line of fine
PISTOLS AND RIFLES CONSTANTLY ON HAND.
DIXONS & HAWKSLEY'S SHOOTING TACKLE.
To insure good shooting from Breech-loading Guns,
we would recommend the use of the

STURTEVANT BRASS SHOT SHELLS,
manufactured by the Union Metallic Cartridge Co.,
Bridgeport, Conn. These shells are the cheapest and
best in the market, can be easily re-capped with ordi-
nary caps, without the use of the implements neces-
sary in priming all other styles of shells.
BUSSEY'S PATENT GYRO PIGEON AND TRAP,
WITH CASE, AND 100 BIRDS.

**DR. FOWLER'S PATENT
HARD RUBBER REEL.**
"The Gem."

Imperishable, Light as a Feather, and
not Liable to Get Out of Order.

Numerous letters of recommendation have been re-
ceived from the most experienced anglers in America,
highly approving of this Reel, prominent among
which are Mr. Seth Green and the Hon. Robt. Roose-
velt.

This Reel, the latest contribution to the angler's
outfit has now been before the public for one year,
and we have yet to hear of the first complaint from the
many hundreds who have used it.

Sportsmen's Goods.

This Rifle, after being tested in the severest man-
ner by the late Board of U. S. Officers, appointed by
the Government to select the best arm for the service;
and after examining over one hundred different sys-
tems, including the best guns of Europe, say of it,
"THAT IT IS THE BEST GUN THEY HAVE
SEEN, OR OF WHICH THEY HAVE ANY KNOW-
LEDGE; THEREFORE RECOMMEND IT FOR
TRIAL IN THE HANDS OF THE TROOPS."

A 7 pound carbine on this plan, with coarse military
sights, has made better targets at Creedmoor the past
summer, than the best English or American target
rifles weighing 10 pounds and having peep and globe
sights.

We are now making these guns to supply the nu-
merous demands, and will have them in the mar-
ket ere long.

The following is our scale of prices: Special Maga-
zine for large game, carrying from 3 to 8 cartridges,
70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10
lbs. weight, from \$60 and upwards, according to finish.
Special Long-range Magazine Rifle for Creedmoor
shooting, 90 grs. of powder, 480 grs. of lead, carrying
3 to 8 cartridges, weighing 10 lbs. from \$100 and up-
ward. Magazine guns for general use, carrying 3 to
9 cartridges, 60 grs. powder, 350 grs. lead from \$40
and upward. Single Breech-Loader, Creedmoor
shooting, for long range, 90 grs. powder, 480 grs. lead,
from \$60 and upward. Single Breech-Loader for
general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead,
from \$30 and upward. The calibre of all our rifles,
unless otherwise ordered, will be .45-100. in.

All communications should be addressed to

NEW YORK, THURSDAY, MARCH 5, 1874.

{ Volume 2, Number 1.
103 Fulton Street.

For Forest and Stream.
TO "ANAS CANADENSIS."

Whither, 'mid falling dew,
While glow the Heavens with the last steps of day,
Far through the rosy depths, dost thou pursue
Thy solitary way?

Vainly the fowler's eye
Might mark thy distant flight to do thee wrong.
As darkly painted on the crimson sky,
Thy figure floats along.

Seek'st thou the plashy brink
Of weedy lake, or marge of river wide,
Or where the rocky billows rise and sink
On the chafed ocean's side?

There is a power whose care
Teaches thy way along that pathless coast,
The desert and illimitable air,
Lone wandering, but not lost.

All day thy wings have fanned
At that far height, the cold, thin atmosphere,
Yet stoop not, weary to the welcome land,
Though the dark night is near.

And soon that toil shall end,
Soon shalt thou find a summer home and rest,
And scream among thy fellows; reeds shall bend
Soon o'er thy sheltered nest.

Thou'rt gone! The abyss of Heaven
Hath swallowed up thy form; yet on my heart
Deeply has sunk the lesson thou hast given,
And shall not soon depart.

He who, from zone to zone,
Guides through the boundless sky thy certain flight,
In the long way that I must tread alone,
Will lead my steps aright.

G. H. W.

The Okechobee Expedition.

FROM OUR FLORIDA COMMISSIONER.

WE had what might be called a stormy voyage. The very night that saw the "Virginus" in such peril, we sighted the light off "Frying-pan Shoals," just caught a glimpse of it, only to be driven away far east of the Gulf stream. Four times did we cross the Gulf stream. For a week we lay to under double reef spanker and foresail, drifting with the waves. Dolphins and porpoises, gulf weed, and Portuguese men-o'-war swam and drifted in the water near us, but they failed to excite the interest they ought, for the reason that the objects we sought on the shores of Florida were far away. The New Year brought a blessing, for upon that day we first descried the long, low line far in the distance that told us of the land we sought. The next day the palms appeared above the horizon, but it was sunset ere we were boarded by the pilots and were threading the tortuous windings of the channel, in tow of the little steamer belonging to the port.

Mosquito Inlet, our destination, is in about lat. 29, long. 81, fifty-five miles south of St. Augustine, and one third the way down the Florida coast. It is about a mile in width, with two channels, obstructed by sand bars, having a depth of seven to nine feet. It is the outwatering of two large lagoons, the Mosquito North, or Halifax river, and the Mosquito South, or Hillsboro' river. Thirty miles each extends, meeting in a common channel at the Inlet. Close in is Massacre Bluff, with its tragical history of the murder of shipwrecked sailors by Indians, early in the Indian war. Two miles further is Mt. Pleasant, a high shell bluff, upon which is the residence of Major Alden, a Massachusetts man, whose hospitality many have shared. A mile further is Lowd's hotel, the only one here, and one of the three houses constituting the town of New Smyrna. This place is about thirty miles from the St. Johns, at Enterprise, the road to which fully maintains the reputation of Florida roads generally.

Though to a stranger the hotel at New Smyrna may present few attractions, being fronted by a muddy creek and backed by a dense forest, it is filled to overflowing every winter, the same boarders forming its quota each succeed-

ing season. The mystery is partly explained when one has enjoyed its hospitalities. Probably the superb fishing of Mosquito Inlet, described so well by another correspondent, has much to do toward maintaining its popularity as a winter resort.

There is the usual variety of game found on the Florida coast. The narrow peninsulas, both north and south, of the Inlet, are well stocked with deer and bear, and many panthers and wild cats find refuge there. The woods back of the hotel, between New Smyrna and Enterprise, are tolerably well filled with deer, though 'tis said the panthers have driven away the turkeys. At the Inlet are large flocks of curlew, bay snipe, "peep," shearwaters and plover, affording excellent sport to the juvenile gunners at the hotel. But by far the best section for procuring large game is the immense Turnbull swamp, near the head of Indian river, abounding in deer, turkeys, panther and bear. Any old field will furnish its bevy of quail.

Besides the means of communication with Jacksonville, via St. Johns, costing about \$15, there is a small schooner which makes the trip as often as the wind will permit; fare, \$5.

The only business of New Smyrna is in live oak, which, in the hands of one firm, employs many schooners the winter through. On both lagoons are large groves of delicious oranges, noted for their size and flavor. The guava, pomegranate, fig and banana will flourish here and have been successfully grown.

There are several good guides here, and they can be hired at the usual rates by addressing at New Smyrna, Volusia county, M. Lewis, Dr. Fox, or Frank Sains. The best location for building or camping is at Mt. Pleasant, where the channel runs close by the wharf, with sixteen feet of water. We camped there upon its shelly shore, and passed two pleasant weeks; pleasant, though I could not but leave a sigh whenever I thought of my field of labor so far away. The weather was unusually cold, even closing the jaws, if they have jaws, of the bloodthirsty mosquito for a time, and causing that omnipresent oldest inhabitant to declare with fearful imprecations that no such had occurred before since the great frost of '35. Yet we would have days delicious in their dreamy warmth, when the air of a morning would be full of the music of robin and red bird. "We," comprehends myself and a young man, a friend, of my own age, who was to accompany me upon my boat excursions, and remain at camp while I was absent upon my explorations inland. We then had a tent that had done service on the St. Johns, which I had brought more for the good it had done that from any love I bore it. It was called the "lawn tent," and resembled the tents figured as belonging to the children of Israel. It was well adapted to the covering of a large surface, but in a "norther" we had to get out guys in every direction, and then stand outside and hang on, while the winds howled and floods descended. We had two boats. I had named the larger the "Forest and Stream," though I quaked inwardly whenever I happened to think, what if the proprietors of that paper should see her? I had her built to carry a heavy load in shallow water, and told her builder to sacrifice everything else to strength and lightness—and he did. She was twenty-one feet long by seven feet beam amidships, flat bottom, centre-board, rigged with two small sails. I had always stood in awe of her, and was much relieved when after she had lain idle nearly two weeks, a rash sailor asked me if he could sail her, and when he came back and said she worked splendidly, I could have embraced him. When the boat was loaded with our freight I saw the wisdom of my instructions to the builder, for she was full to overflowing. And so, one pleasant day we started down the Hillsboro', laden almost to the water's edge. We were fortunate in getting a tow down the river for nearly twenty miles.

The Hillsboro' for twenty miles is filled with mangrove and marshy islands, making many exceedingly tortuous channels difficult to follow. "Shipyard Reach," fifteen miles south of Smyrna, is a noted place for ducks; but the

best of all grounds is a little below on the west channel, where they come to a little pool to drink all day long. Parties have been here and shot a hundred to the man in half a day's shooting. Bissett's orange mound is a favorite place; here the wild oranges glow and gleam through the dark foliage, covering a shell mound, at whose base is a drinking pool where the ducks flock by scores. October and November are the best months and again in March, the interim being spent by the greater part of the mass of ducks wintering in Florida further south.

From New Smyrna south occur a great many shell and earth mounds of ancient origin, several of which I have explored and the results of which explorations I shall publish in a future letter.

The Mosquito lagoon commences at the "Devil's Elbow," a channel of the Hillsboro' where there are nine crooks in half a mile. We passed safely through the Devil's Elbow and arrived at the headquarters of the Swifts, proprietors of the live oak interest here. From Captain Swift and his employees we have received the kindest attention. Mosquito lagoon is here two miles in breadth and ten miles to the canal connecting this lagoon system with Indian river. There are several orange groves on this lagoon, both wild and cultivated. We entered the canal about noon one day, passing the first stake half a mile north, and standing away southeast till opposite the canal. The eastern end is invisible till directly at its mouth, owing to bushes and sand bars. The canal is about half a mile long and twelve feet wide. Connecting the Indian river lagoon with the Mosquito, it forms with them an inside route of water travel over one hundred and eighty miles in length. The water was at the highest when we entered, yet we barely passed through, drawing but a foot. Fallen coquina has narrowed the passage to seven feet in some places. The coquina is curiously hollowed by the water, leaving overhanging arches supported by pillars fantastically wrought. The kingfisher has driven his shafts into the rock and then occupied them. A large tree, with table shaped top, stands near the eastern end and can be seen a long ways, forming a conspicuous land mark. There is good camping ground near here, and an abundance of fish and ducks close by. Deer and bear range the hammocks north. We camped that night at Andrew Jackson's. Andrew has the neatest little orange grove on the river. Close by, two miles, is the famous Dummitt orange grove, so often described. Capt. Dummitt, the original owner of this grove, died a year ago. He was ad old resident and highly respected. The grove is now owned by his three daughters and two others. This year's crop is estimated at 125,000, fully as many having been blown off in a tremendous gale last autumn. Two smaller groves near here have, respectively, four and eight thousand. It is about sixteen miles from the canal to the head of the river, and ten miles to Sand Point, upon the west bank of the river. The buildings of "Aurantia grove," so much advertised, can be seen about seven miles up the river. I had no time to visit it, and so cannot speak of its merits from observation. The land is said to be good, worth \$1.25 per acre. Indian river needs for its proper development a railroad to Lake Harney, the head of navigation on the St. Johns, or a new canal to Mosquito lagoon, with light draught steamers plying between Jacksonville and the lagoon. The railroad is the more feasible route, perfectly practicable, and would probably pay. The distance to be traversed is said to be but thirteen miles. A small steamer is needed upon the river, and three good hotels, one at the head of the river or lagoon, one midway, and one near the southern end. Then this delightful climate might be enjoyed by the thousands now kept away by the difficulties attending transportation and lack of accommodations. The present route, via Salt Lake, is very tedious and uncomfortably long.

We crossed the river one night, after waiting two days for a wind. The water was all aglow with phosphorescent light. Every dash of our little boat raised a silver shower, and thousands of fish darted hither and thither, leaving tortuous trails of fire, like those Fourth of July serpents of our boyhood. Rafts of ducks sprang up with noise like

thunder, invisible but for the fiery shower they raised upon leaving the water.

It was midnight before we reached Harvey's and anchored. It is six miles across to Salt Lake. There is a settlement a mile from the river, where also is a small boarding house. There is but one building at the landing, a store. Here for the first time the visitor from the North sees the palmetto, in the long columnar rows, so characteristic of Indian river. Two days we passed here and at Titusville, two miles below, awaiting a fair wind. The hotel at the latter place is the only one on the river, and is said to be well kept; \$3 per day is charged for transient boarders. Board at the settlement is \$1.50 per day. This is the northernmost of the four post offices on the river. A mail is supposed to arrive and depart once a week, but it really arrives and leaves with the wind. Very fine specimens of native woods may be procured here, such as the crabwood, royal palm, mangrove, palmetto and iron wood, made into canes, etc.

Titusville owes all of its present prosperity to the indefatigable energy of its proprietor, Col. H. T. Titus. This place is only noteworthy as a point of arrival and departure for more interesting points on the river. For ducks one must go across the river to Dummitt's, ten miles, or to Banana creek, still further. For deer, to Merritt's Island, or to the prairies bordering Salt or South lakes. Boatmen and guides can be hired to any point on the lagoon and interior. James Stewart, captain of the "Blonde," is perfectly trustworthy and reliable. Jim Russell is thoroughly posted upon the game and fish of Indian river, and will be found of great value to any party contemplating a winter's camp here. Address them at Sand Point, which is the old name for Titusville.

I visited some old acquaintances here, and walked over to the store of a man named Joyners. I was much surprised to find him apparently overjoyed to meet me, the more so as we had met but once. My heart warmed as he poured forth congratulation and welcome, and I thought here was one true friend, if he did have a suspicious squint in one eye and never once looked me square in the face. What was my disgust to find, upon returning to the boat, that he had despatched a "justice" to arrest me for an alleged violation of the license law, in giving a man whom I had hired an old coat. A friend told the "justice" he thought he'd better not trouble me, and the justice departed, saying he "thought so too."

We left Titusville at daybreak one morning. The wind gradually increased till at noon it was blowing half a gale, and we were very glad to seek shelter behind "Oleander Point," about twenty-five miles from Sand Point. A gale is the specialty in which Indian river excels; either a gale or a calm. But then this is a stormy winter, though 'tis hard to realize it with the thermometer at shirt-sleeve temperature. Oleander Point is formed of disintegrated shells, white as snow, the beach ending in a crescent-shaped bar. South of this beach is a coquina formation, extending for miles, where the rocks are worn into every shape imaginable. A Mr. Hardee lives here, whose grove of three-year-old trees is the finest I have seen. He has splendid oranges from trees only three years from the bud. His crop brought a dollar per hundred more in Savannah than the St. Johns oranges.

We slept upon the beach that night beneath a lean-to tent which my friend, who is an old camper out, had put up between two palmettos. The cheerful blaze in front made it far preferable to our close quarters aboard the boat. The next afternoon, the wind abating, we set sail, and at night, the wind increasing, made a camp on the shores of Horse Creek. This is a high coquina bluff of pine land, a fine place for camp or residence. Nearly opposite is the southern end of Merritt's Island, whose high, pine-covered shores have been in sight for the last twenty five miles. Just south of here, three miles, is Elbow creek, which was to be the terminus of a canal to connect Indian river with Lake Washington, on the St. Johns. The scheme is now "busted," and Indian river will have to seek connection with the outside world elsewhere. At Turkey creek, fifteen miles south, is a fine orange and banana grove, where huge bunches of the latter fruit can be purchased at \$1 per hundred. St. Sebastian is twelve miles from Turkey creek. It is a beautiful sheet of water, and the camper out will find here secure shelter during gales. From Horse creek we were assisted by that veteran guide and boatman, Jim Russell. What Jim don't know about Indian river is not worth knowing. He has spent twenty years here and can tell to a certainty just where and when the rarest birds are to be found, where to go for deer, bear or panther. Jim, then, took us in charge, and kept us through the Narrows, with a dim vision of Pelican Island north of the entrance; by Indian river inlet, old Fort Capron, and anchored us at two o'clock one morning just as the moon sank out of sight, at Fort Pierce. Here we made our final camp, one hundred and thirty miles south of our starting point at New Smyrna.

Fort Pierce is the name given to this place during the Indian war, when there was a military station here. Here it was, according to history, that the famous chieftain, Wild Cat, or Coacoochee, was captured and sent west. The old parade ground made over thirty years ago is still in good condition, south of the present site of Fort Pierce, or "St. Lucie." The best turtling and oyster grounds are here, and splendid fishing at the inlet, three miles east. There is a party of gentlemen camped just north of here. They are enthusiastic sportsmen, and have been fishing Jupiter Inlet and Indian river inlet with flies. Their suc-

cess was wonderful. They tell me that they caught crevalle, bonefish and bluefish, the bonefish and crevalle making hard fight and splendid sport. They had late—late for this country—copies of FOREST AND STREAM. Of course their encomiums were lavish of its merits. And let me say, in passing, that I have not met with a single sportsman carrying a fine breech loading rifle or split bamboo, who has not a copy of FOREST AND STREAM, and is ever ready to advocate its superiority over all others; they cannot speak of it without praise.

I have photographed the most noteworthy and picturesque features of Indian river and Mosquito lagoon, and the negatives are carefully preserved for future manipulation. Within the week that has elapsed since my arrival, I have thoroughly explored the country between the river and the cypress bordering Lake Okeechobee, walking and riding one hundred miles in four days over, or rather through, a submerged tract of country, visiting my old friends the Indians, and discovering new facts. In closing I will recapitulate the different camping grounds and haunts of game, promising a better list in some future number.

For fish, go to New Smyrna, Indian river inlet or Jupiter. For duck, Mosquito lagoon and Hillsboro', at the places already mentioned, the marshes between Black Point and the canal, at Dummitt's, Pelican Island, near the Narrows, and St. Lucie sound. Ten-mile creek, ten miles back of Fort Pierce, also abounds in teal and wood duck. For deer and bear, "Turnbull's hammock," near New Smyrna; Merritt's Island, and the beach ridge, three miles from the southern end; the Narrows; St. John's prairie, five miles west of Capron and beyond. For turkey, St. John's prairie and about St. Lucie sound.

There are good camping sites at Indian river canal, Jones' Point, Addison Point, Horse Creek, Turkey Creek, Merritt's Island, south end; St. Sebastian, Barker's Bluff, Fort Capron, Fort Pierce, and at various points along St. Lucie sound. Water may be procured almost anywhere by digging a shallow pit in the sand. For other information upon Indian river I refer the reader to my article in a November number. A party of four could enjoy the pleasures of sporting here to best advantage. Let them come as I have, with everything necessary for the winter, prepared to "rough it," if need be, and my word for it they will depart with a desire to come again. A friend of mine purposes erecting a commodious hotel near St. Lucie, where everything needful to the perfect enjoyment of this region of game and health will be at command.

The guides to Indian river are few, but I can recommend James Stewart, Charles Stewart, John Houston, Rufus Stewart, and Burton Williams. There are yet two months in which the balmy breezes of Indian river blow soft and pleasant. Perhaps some of the readers of FOREST AND STREAM may avail themselves of the information I have gathered for their benefit. Should it reach them too late to be of any use, they must remember that the mail here comes and goes at the option of the "clerk of the weather," and that he not always purposes to blow fair.

NATURAL HISTORY.

It is a fact beyond doubt that the whooping crane (*grus americanus*) is a resident of Florida. There has been seen for many years, upon "Alligator Flats," about twenty miles from Fort Capron, Indian river, a large white bird, "as tall as a man," which the native Floridians called a "stork." Last year the young of this bird was taken from a nest and brought to Fort Capron, where it was kept till over six months old. The plumage of this bird was white from the first. It was a whooping crane, if the description of its possessors was correct, as it agreed exactly in specific characteristics with the description of the whooping crane. For many years these birds have roamed over the Alligator flats and about the prairies of the headwaters of the St. Johns. Their large size and loud cry have always made them conspicuous, and the "cow hunters" of the backwoods, not knowing any other bird so large have given them the name of "stork." The sand-hill crane is very plentiful here, and there is no cause for the belief that the two species are confounded. The great white heron, the *Audubonia occidentalis*, is the only other bird approaching the whooping crane in size, and likely to be mistaken by ignorant people for it, and the supposition that it may be this species is precluded by the habits and *habitat* of that bird. We think this the first recorded instance of the discovery of this species in Florida, though we may be mistaken.

The Everglade kite (*rostrhamus sociabilis*) has been shot upon the St. Johns prairies by your correspondent, and he believes that he will find the eggs of that bird this season. The specimens procured were in the adult and young plumage.

Authentic information of the discovery of the eggs of the paroquet (*conurus carolinensis*) has been obtained, and it is confidently expected that they will be secured the coming season.

FRED. BEVERLY.

"If I had a mince pie, and should give two-twelfths to Harry, two-twelfths to John, two-twelfths to Isaac and should keep half the pie myself, what would be left?" There was a profound study among the scholars, but finally one lad held up his hand as a signal that he was ready to answer. "Well, sir, what would there be left? Speak up so loud that all can hear," said the committeeman. "The plate!" shouted the hopeful youth.

—Smith and Brown had been rowing on the Hudson. Relating their adventures, Smith said that while on shore taking a quiet glass of lager Brown remained in the boat and lay on his oars. "Poor Brown," remarked a lady, "what a hard bed he had." "Not so," replied Jones, "he 'feathered' his oars."

For Forest and Stream.

A WINTER CAMP ON THE MAGALLOWAY.

IT was at Island Pond, on the Grand Trunk Railroad, that N. and I struck off from the confines of civilization en route for the head waters of the Connecticut River, to hunt moose in winter. We had never explored this region and had only a vague idea of the locality in which to find our game, intending to cross from the lakes that feed the Connecticut to the Magalloway and trusting to chance to obtain a guide from among the hunters or settlers thereabouts. With our Indian snow shoes and a blanket, we were prepared to enter the woods, taking only such provisions and clothing as could be carried in a pack, a hatchet in the waist belt, a pistol and rifle. The common rackets used by the natives are not to be compared with Indian snow shoes, which are woven with fine strings of caribou or moose hide. Caribou strings are best, as they shrink and become tightened by wetting while moose hide loosens.

We were assured that we should find a cabin used by hunters on the shore of First Lake, one of the two in which the Connecticut takes its rise. Our guide was a certain Bill Lewis, whom we found at his log cabin, and who was induced to go with us for a money consideration and a share of our provisions. About noon we started into the woods for the camp with no misgivings about reaching it before dark, as the road we were to follow had been "blazed." Four miles we sped along without snow shoes on a firm crust. The afternoon was waning, dusk coming on, but still no signs of the camp; and stranger yet, the blazes were so indistinct that it required very close inspection to find them. In fact we had not gone far before all traces of a road were gone. Still no camp, and the sky overcast with rain! Yes, we were lost, that was sure, when we could find no more blazed trees. As darkness approached, it was a question of a few minutes either to find the cabin or to sleep where we were in the snow. None but a hunter's expedients were of use. So we looked about for sleeping quarters; the rain made it useless to attempt to build a fire, but shelter at least must be had. No friendly pine tree spread its sheltering arms for us, but a huge tree trunk, fallen and heaped with snow, under which it was possible to dig a hole and burrow after the manner of hibernating bears, was the only lodging that offered. So thus we snatched a few hours of sleep. I shall never complain of a hard bed again if it be under a roof and dry.

The dog contributed some warmth, but of a shivery, moist, doggy nature.

With the morning light we set off again, not much refreshed by our night's lodging in the snow; and not relying on blazed trees, we soon reached First Lake, where we built a fire and dried our clothing. Though somewhat discouraged by the follies of a night, we were bound to find a moose. Our guide exerted himself. The ice was several feet in thickness, but he cut a hole and caught some trout, which were soon done brown and served on spruce chips, and garnished with frizzled bacon. A flock of snowbirds or crossbills of brilliant hue twittered about our camp, regarding us perhaps as a second edition of the "Babes in the Wood." On our way from First and Second Lakes to the Magalloway we met two moose hunters, natives, going out to the clearing after a successful hunt. They had killed a moose and left the meat covered with snow, which information was encouraging. Bill Lewis was a poor guide, as we had already discovered, but he proved to be a worse hunter; in fact we preferred that he should tend camp while we hunted.

Stalking the moose is uncertain business, and requires all one's patience and skill to be successful. Many a moose we tracked through the snow for miles only to hear the animal break away amongst the spruces when within half shooting distance. These cunning animals often make a circle and approach their own back track, where they await the hunter's appearance in safety.

Our snow shoes were bound with flannel on the wooden frames to muffle the sound. Signs of moose are found on the trees and shrubs where they browse, or where the bark is worn off by the rubbing of the antlers while in the velvet. Their tracks in snow can be detected even after they have been filled up with fresh snow, and when carefully cleared out with the hand the hunter feels the direction in which the game was moving by the shape of the holes made by their cloven feet. When near the game, only whispers or signs are used, and each footstep must be carefully considered. The moose may be behind the nearest snow covered spruce, or lying under a thick pine. If not wounded when he starts, he will plunge away and soon put miles between you. The Indians rarely abandon the chase, although it may take several days to run down a moose. We found tracks plenty, but soon discovered that other hunters had been after them. The next day we took a course towards Camel's Hump Mountain, near the Magalloway, where we built a good brush camp, and after a hard chase killed a young bull moose. N. was off alone the next day, but I decided to rest in camp. During the day I visited a small pond with an outlet near the river, and caught some brook trout through the ice, using pork for bait. We were now well supplied with provisions; moose meat and trout were a welcome change after a diet of bacon and biscuit.

We followed down the Magalloway stream on the ice until we came to Parmachene Lake, where we were delighted to meet some lumbermen fishing on the lake, which we crossed, and arrived at the lumber camp before dark, where a bountiful supply of bread, hot biscuit, baked beans and

apple sauce, was set before us. Your entertaining correspondent, Jacobstaff, has already described the achievements of one hungry hunter in a lumber camp, where he surrounded a "brown stone front." So that I need not dwell on a similar experience.

The head waters of the Connecticut and Magalloway Rivers have been a good hunting ground for moose and caribou, but like the region about Moosehead Lake, an indiscriminate slaughter of this noble game in season and out, has made them very scarce, although I am glad to see by the communication of W. E. S., that moose and caribou are getting back to this section.

Until the Game Law is enforced the hunter must penetrate the wilds of New Brunswick or Cape Breton, if he would kill large game. J. A.

THE QUADRUPEDS OF ARCTIC LANDS.

Cervus Tarandus; Cervus Rangiferens.

NUMBER ONE—REINDEER.

IT is difficult to determine with precision the limits of Arctic lands, since many countries situated as low as sixty or even fifty degrees, such as South Greenland, Labrador, Alaska and the country around Lake Baikal, have in their climate and productions a decidedly Arctic character, while others, as the coast of Norway, due to close proximity to the Gulf stream, enjoy even in winter a remarkably mild temperature.

The torrid zone animal life is comparatively limited; it abounds in the north temperate, while in the frigid it is more abundant, (perhaps this is a sweeping assertion, and should be modified by saying on the borders of the two latter zones animal life is most abundant.)

First ranks the reindeer, and in my description I shall confine myself more particularly to the European variety rather than the American caribou, which merits separate notice.

The reindeer has been called the "camel of the north," and well may be, for he is a no less valuable companion to the Samojede and Lapp than the "ship of the desert" to the wandering Arab. This species of deer is the only member of its tribe which has been generally domesticated. Undoubtedly the most useful, it is by no means the most comely of its race. Its clear, dark eye, like most of deer, has a beautiful expression, but has neither the grand proportions of the wapiti, or the grace of the roe buck, and its thick, square formed body is far from being a model of elegance. The front hoofs are capable of great lateral expansion, and curve upwards, while the secondary ones behind, which are but slightly developed in other members of the family, are considerably prolonged, a structure which, by giving the animal a broader base to stand upon, prevents its sinking too deeply into the snow or morass. Had the hoof of the reindeer been formed like that of the stag, he would be unable to drag the Laplander's sledge with such speed over the yielding snow, even as would the camel to perform long marches over burning sands without his broad elastic sole pad.

The short legs and broad feet of the reindeer likewise enable him to swim with greater ease, a power of no small importance in a country abounding in lakes and rapid rivers, and where scarcity of food renders frequent migrations necessary. When the reindeer, moves a remarkable clattering sound may be heard some distance. This is produced by the long hoofs which separate as they press the ground and close when raised.

A long mane of dirty white hangs from the neck of this deer. In summer the body is brown above and white beneath. In winter, long haired and yellowish white. Its antlers are widely different from those of the stag or wapiti, having broad, palmated summits, and branching backward to the length of three or four feet; their weight is considerable, twenty or twenty-five pounds, and it is remarkable that both sexes have horns, while in all other members of the deer tribe the males alone are in possession of this ornament or weapon.

The female brings forth in May a single calf, rarely two. This is small and weak, but after a few days follows its mother, who suckles her young but a short time, as it is soon able to seek its food. The reindeer gives but little milk, at the utmost, after the calf is weaned, a half pint daily, but the quality is excellent, being uncommonly thick and nutritious. It consists almost wholly of cream, so that a great deal of water may be added before it becomes inferior to the best cow milk. Its taste is excellent, but the butter made from it is rancid, though the cheese is very good.

The milking of a herd of reindeer presents a most animated scene. When they have been driven within an inclosure, and the outlets secured, a Lapp, selecting a long thong or cord, takes a turn of both ends round the left hand, and gathers the "bight" in loose folds with his right. He now singles out a deer and throws the bight with an aim no less unerring than that of a Mexican "vaqueros," or South American "guacho." Sometimes the deer makes no resistance, but generally the moment it feels the touch of the thong as it entangles the horns, it breaks away, and is only secured by the most strenuous efforts. Every minute may be seen some unusually powerful deer furiously dragging a Lapp round and round the enclosure, and sometimes it fairly overcomes the restraint of the thong, and leaves its antagonist prostrate upon the sod. This part of the scene is highly exciting, and it is impossible not to admire the trained skill evinced by all the Lapps, women as well as men. The resistance of the deer being overcome, the Lapp takes a hitch of the thong round its muzzle and head,

and then fastens it to the trunk of a prostrate tree, many of which have been brought into the inclosure for this especial purpose. Men and women are indiscriminately engaged in singling out milch reins and milking them. Every one is fully occupied, for even little children are practising throwing the lasso, in which they evince much skill, although their strength is insufficient to hold the smallest doe.

The only food of the reindeer during the winter is the moss known as *lichen rangiferens*, and his instinct or acuteness of olfactories in discovering it is surprising. No matter how deep this lichen is buried, the animal is aware of its presence the moment he comes to the spot, and this food is never so agreeable as when he digs it for himself. His manner of doing this is adroit. Having first ascertained by thrusting his muzzle into the snow whether the moss lies below or not, he begins making a hole with his fore feet, and continues working until at length he uncovers the lichen. No instance has ever occurred of a reindeer making such a cavity without discovering the moss he seeks. When the snow is too deep, as sometimes happens, he betakes himself to the forests and feeds upon another lichen which hangs on pine trees. In summer their food is of a different nature. They are pastured upon green herbs or the leaves of trees. Judging from appearances of *lichen rangiferens* in the hot months, when it is dry and brittle, one might easily wonder that so large a quadruped as the reindeer should make it his favorite food and fatten upon it; but toward the month of September it becomes soft, tender and damp, with a taste like wheat bean. In this state its luxuriant and flowery ramifications somewhat resemble the leaves of endive and are as white as snow. Though domesticated from time immemorial, the reindeer has only been partly brought under the yoke of man, and wanders in large wild herds in the forests and tundras of the Old World. He is found from Lapland and Norway and the mountains of Mongolia and banks of the Ufa, as far as Novaya Zemla, and Spitzbergen. All attempts to prolong the life of the reindeer in zoological gardens have failed, and in the royal park of Stockholm, Hooguer saw some of these animals which were quite languid and emaciated during the summer, although care had been taken to provide them with a cool grotto to which they could retire during the warmer hours of the day.

During the summer the reindeer can only enjoy health in the fresh mountain air or along the bracing sea shore, and has as great a longing for low temperature as man for the genial warmth of his fireside in winter. The reindeer is easily tamed, and loves the society of his master, though unlike other domestic animals he is noways dependent upon man for subsistence, but finds it alone and unaided, wandering at will, summer and winter, never being inclosed. These qualities are inestimable to the inhabitants of a country where the keeping of domestic animals demanding shelter and stores of provisions through winter, would be an impossibility. During the wanderings of the northern nomad it carries his tent and scanty household furniture or drags his sledge over the snow.

The reindeer is comparatively unfit for riding, and when so used the rider is seated upon the haunches, as a slight shock easily dislocates its vertebral column. One would hardly suppose the reindeer the same animal when ereeping languidly along under a rider's weight, as when, unencumbered by a load it vaults with the lightness of a bird over the obstacles in its way to obey the call of its master. Trained to the sledge, he travels with great speed. There is the portrait of one preserved in the palace of Drottingholm, (Sweden) which performed the extraordinary journey of eight hundred miles in forty-eight hours, drawing an officer carrying despatches, but dropped dead when the journey was accomplished. Care must be taken not to overload or ill treat him for then his obstinacy rivals that of the mule, and when enraged he turns upon his master with such fury that he is fain to shelter himself under the overturned sledge until the rage of the deer has abated.

The reindeer attains an age of from twenty to twenty-five years, but in its domesticated state is generally killed when from six to ten years old. The flesh is excellent, and the tongue and marrow are considered as great delicacies; also the contents of the stomach in winter.

Every portion of this deer is made available by the Lapps. The blood is carefully saved and made into puddings, or drank warm. The horns furnish spoons; the hoofs glue; bow strings and thread are made from the sinews, and the skin furnishes blankets and clothing so impervious to cold that with a single skin above him, the Arctic inhabitant will defy the severities of the coldest Arctic night. In Tornea the skins of new born calves are prepared and sent to St. Petersburg to be manufactured into gloves, which are extremely soft and durable but very dear.

The most dangerous enemies of the reindeer are the wolf and glutton or wolverine, (*gulo borealis* or *arcticus*) which belongs to the bloodthirsty marten and weasel family. Besides the attacks of its mightier enemies, the reindeer is subject to the persecutions of two species of gad fly. The one (*ostrus tarandi*) called *hurbma* by the Lapps, deposits its glutinous eggs upon the animal's back. The larvæ, on creeping out, immediately bore into the skin, where they cause swellings or boils an inch or more in diameter, with an opening at the top of each, through which the larvæ may be seen imbedded in the purulent fluid; often the whole back is covered by these, which speedily cause emaciation and disease through the enormous drain of the fluids of the body consequent upon decomposing animal matter. Aware of the danger, the reindeer runs wild and furious as soon

as he hears the buzzing of this fly, and seeks refuge in the nearest water.

The other species of fly (*asetus nasalus*) lays its eggs in the nostrils of the deer, and the larvæ boring themselves into the fauces and beneath the tongue of the poor animal are a great source of annoyance.

A pestilential disorder similar to the rinderpest will sometimes sweep away whole herds. Thus in a few days the Lapp or Samojede may be reduced from affluence to poverty. The proud possessor of several thousands of deer is compelled to seek the precarious livelihood of the northern fisherman.

The Horse and the Course.

—The South Carolina Jockey Club held their spring meeting on the old Washington Course at Charleston, S. C. There was a large concourse of people present to witness the revival of the turf in South Carolina. On February 28th the first race was a free handicap, a dash of a mile and a quarter, the purse being \$200, \$150 to first horse. The entries were:—Ortolan, Tabitha, Midnight, and Revenge. Ortolan won in 2:17. The second race was a one mile dash with 100 pounds up. Three horses started. Gaberlunzie won in 1:54. The third race was mile heats for three year olds for a stake of \$300. Lady Washington won the two last heats in 1:51½, 1:52. On March 2d the first race was a hurdle handicap, two miles, over eight hurdles, three feet six inches high, welter weights, purse of \$350. The entries were Lanta Lawler, 140 pounds; Limestone, 145 pounds; Jim Hinton, 145 pounds; and Ellen C., 115 pounds. Lanta Lawler was withdrawn, but the remaining horses made one of the handsomest races of the kind ever seen on the Washington Course. Limestone proved the winner. Time, 3:59. Jim Hinton was second and Ellen C. third. The next race was a selling race of \$200; mile dash; horses to run for \$1,000 to carry their regular weight. There were two entries—Ortolan and Fire Ball. The former won in 1:52½. The consolation purse of \$200, mile dash, for horses that have run and not won during the meeting; weight for age. There were three entries—Flower Girl, Vandalite, and Tabitha. Flower Girl won in 1:51. The citizens sweepstakes, three mile heats, for all ages; \$100 entrance, half forfeit; club to add \$750. Granger won in two straight heats. Time—5:51, 5:51.

—The Utica Park will soon have a railroad track running to the gate, which will add a much needed improvement, and the lack of which has given rival associations a considerable advantage heretofore. The following is a complete list of the Ladies' and Oneida Stakes to be competed for on the first day of the June Running Meeting on the Utica Park:—

LADIES' STAKES.—For two-year-olds; \$300 in gold added: W. G. Dorling, New York, b. f. Blairgowrie, by Breadaband, out of Klearnet.

D. McDaniels, New Jersey, c. f. Mattie A., by Australian, out of Minnie Mansfield.

D. McDaniels, New Jersey, e. c. —, by Australian, out of Betsy Ward.

Hugh Gaffney, Maryland, b. f. —, by Lamington, out of Qaides, by Belshazzar.

Wood Stringfield, Kentucky, c. c. Warsaw, by War Dance, out of Sister to Charity, by Imp Kt St. George.

Rice & Merrill, Georgia, — Volcano, by Vandal, out of Aradine, by Sovereign.

L. A. Hitchcock, Georgia, ch. f. —, by Daniel Boone, out of I. O. U.

J. W. Weldon, Georgia, ch. c. Warfare, by War Dance, out of Wagonette, by Wagoner.

A. B. Lewis & Co., Georgia, b. c. Victor, by, Vandal, out of Septima, by brown Dick.

A. B. Lewis & Co., Georgia, b. f. Fannie Johnston, by Hunter's Lexington, out of Betsy Hunter.

J. R. Barry, Tenn., b. c. Asterlite, by Asteroid, out of Nora, by Imp Sovereign.

ONEIDA STAKES.—For three-year-olds; \$500 added: Wm. Jennings, Tenn., b. c. Larry Hart, by Planet, out of Nora, by Imp. Sovereign.

D. Desmond, Saratoga, b. f. Mollic Darling, by Revolver, out of Skipper, by Daniel the Prophet.

D. McDaniels, New Jersey, c. f. Madge, by Australian, out of Albama.

D. McDaniels, New Jersey, b. f. —, by Red Dick, out of Ettie Skippen.

Joseph Donohue, New Jersey, ch. c. Dublin, by Kentucky, out of Zaidee, by Breckinridge.

William M. Connors, Louisiana, ch. f. Moonbeam, by Planet, out of Edina, by Imperial Knight of St. George.

A. M. Burton, Tennessee, ch. c. Red Jackson, by Vandal, out of Sadowa, by Jack Malone.

L. A. Hitchcock, Georgia, brn. f. —, by son of Daniel Boone, out of Meanness, by Brown Dick.

A. C. Lewis & Co., Georgia, b. f. Vandalite, by Vandal, out of Vesper Light.

William M. Connor, Louisiana, ch. c. Stampede, by War Dance, out of Dolly Morgan, by Revenue.

—After the horse is nine years old, a wrinkle comes on the upper corner of the lower lid, and every year thereafter he has one well-defined wrinkle for every year over nine. If a horse has three wrinkles, he is twelve; if he has four, he is thirteen. Add the number of wrinkles to nine, and you will get it.—*Ex.*

KNOWING HEN.—One of the citizens of Groveland, Mass., a few days since made a trip to Haverhill in a sleigh. Arriving at the city he proceeded to hitch his horse to a post. As he was about leaving to attend to business, one of his hens came out from under the sleigh seat, where she had stolen a nest, and started somewhat briskly round town on a tour of observation. The former gave chase, but biddy was too spry, and the proprietor concluded that that piece of property had "taken wings and flown away." Returning to the sleigh after an hour's absence, he was surprised to find the hen quietly sitting on her nest of eggs under the seat, she having returned and found the sleigh, though there were several others in the vicinity.

THE WHITBY SMACK.

"SHE ought to be in, she ought to be in,
Here's another moon begun;
She sailed last Friday was a week,
And it is but a few days' run.

"I've left our Jane at home,
She'll nor sleep, nor bite, poor lass;
Just toss her wedding clothes about,
And stare at the falling glass.

"The banns were out last week, you see;
And to-day—alack, alack,
Young George has other gear to mind,
Out there, out there in the smack!

"I bade her dry her tears,
Or share them with another,
And go down yonder court and try
To comfort Willie's mother.

"The poor old widow'd soul,
Laid helpless in her bed;
She prays for the touch of her one son's hand,
The sound of his cheery tread.

"She ought to be in, her timbers were stout;
She would ride through the roughest gale,
Well found and mann'd—but the hours drag on;
It is but a four days' sail."

Gravely and sadly the sailor spoke,
Out on the great Ker head;
Sudden a bronzed old fishwife turn'd,
From the anxious group, and said:

"Jenny will find her lovers anew,
And Anne has one foot in the grave;
We've lived together twenty year,
I and my poor old Dave.

"I've a runlet of whiskey fresh for him
And 'baccie again he comes back,
He said he'd bide this winter ashore,
After the trip in the smack.

"We have neither chick nor child of us,
Our John were drowned last year;
There is nothing on earth but Dave for me,
Why there's naught in the wind to fear.

"He's been out in many a coarser sea,
I'll set the fire alight;
We said 'Our Father' before he went;
The smack will be in to-night."

And just as down in the westward
The light rose, pale and thin,
With her bulwarks stove, and her foresail gone,
The smack came staggering in.

With one worn face at her rudder,
And another beside her mast;
But George and Willie and staunch old Dave?
Why, ask the waves and the blast.

Ask the sea that broke aboard her,
Just as she swung her round;
Ask the squall that swept above her,
With death in its ominous sound.

"The master saw," the sailor said,
"A face past the gunwale go;"
And Jack heard "Jane!" ring shrill through the roar;
And that is all we know.

I can't tell. Parson says grief is wrong,
And pining is willful sin;
But I'd like to hear how those two died,
Before the smack came in.

Well, this morning the flags fly half-mast head,
In beautiful Whitby Bay;
That's all we shall know till the roll is read,
On the last great Muster-day.—*All the Year Round.*

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

PISCICULTURE AND THE FISHERIES.

BY SPENCER F. BAIRD.

Read before the American Fish Culturists' Association,
Held in New York, Feb. 10, 1874.

WE are indebted to Professor Baird, U. S. Commissioner of Fisheries, for the advance sheets of the general summary to be prefixed to the Record of Scientific and Industrial progress for the year 1873, now in press of Harper Brothers. This admirable and comprehensive paper embraces the communication read by Professor Baird at the meeting of the American Fish Culturists' Association, held on the 10th of February:—

The subject of fish-culture and the fisheries continues to increase in importance, and in view of the economical value of the products of the sea and the interior waters, and in the amount of capital and effort directed toward their acquisition, this interest is amply justified.

Several exhibitions during 1873 have been made of fishery products and interests, the most important being that at Vienna during the past summer. Legislation has also been initiated or continued looking toward the judicial determination of the rights of the general public and of the individual, the most important step in this direction being the decision of the United States Supreme Court in reference to the obligation of the corporation controlling the dam across the Connecticut River at Holyoke to construct a suitable fish-way. This river in former years abounded in shad and salmon from its mouth to its sources, and furnished a vast amount of excellent food to a large population. The erection of dams along its course obstructed the upward movement of the anadromous fish, with the result of finally exterminating the salmon, and of reducing the supply of shad to a minimum. The most considerable of these obstructions, and the first met with above tide-water, was

the great dam at Holyoke. An Act of the Massachusetts Legislature, authorizing the Fish Commissioners of that State to require the construction of a fish-way over this dam, was resisted by the company, and the case carried successively to the Supreme Courts of Massachusetts and of the United States, judgment being given by both tribunals against the company, which was thus obliged to yield. A fish-way was constructed during 1873 upon the plan of Mr. E. A. Brackett, of Massachusetts, which, it is hoped, will answer the purpose in view.

In no country, however, has the subject of the fisheries and their legal relations been more thoroughly considered than in Germany; and a very elaborate system of regulations is now under discussion, which, it is expected, will be the most complete in existence.

The number of States having Fish Commissioners for the improvement and regulation of the fisheries within their borders has been increased during the year by the addition of Pennsylvania, Ohio, and Michigan; so that at the present time all the New England and Middle States except Delaware, and all the States bordering on the great lakes with the exception of Indiana, Illinois, Wisconsin, and Minnesota, are provided with these important State officers. Movements are in progress, however, which it is probable will result during 1874 in the appointment of Commissioners in Minnesota, Illinois, Maryland, Virginia, North Carolina, and possibly Iowa.

Numerous statistical publications in reference to the fisheries of the Old World and the New have made their appearance, although mostly relating to 1872. We have also a very elaborate communication from Dr. Francis Day on the fresh-water fisheries of India, and another by the Minister of Marine and the Fisheries of Canada. It is to be regretted that no provision is made by the United States government for the collection and publication of accurate and exhaustive details on this branch of industry, so ably worked up by France, Norway, and other foreign nations.

The special fisheries of the world have been prosecuted with their average success. The herring has furnished provision and employment for immense numbers of people both in Europe and America. The Astrachan herring (*Alosa caspica*), a species probably like our fresh-water herring or alewife, which was, up to the years 1854 and 1855, only used in extracting the oil, has taken a prominent place as a food fish since that time. The Russian name, *bescheuka* (the furious fish), seems to have incited a prejudice against it; but through the efforts of Mr. Baer, and a board of commissioners appointed to investigate the fisheries of Russia, the prejudice was largely overcome, and, under the name of herring, as a salted fish it has become an important element in the Caspian fisheries. In 1858 there were salted in the rivers of Astrachan 43,000,000 of this fish. The number in 1871 was 140,000,000; and in 1872, 160,000,000; while in 1873 only 30,000 were used for oil.

The cod fisheries of both the Atlantic and Pacific have also been abundantly worked. The occurrence of cod in immense numbers in the Pacific is a fact of recent appreciation; and it is satisfactory to know that, should the supply from the Atlantic be at all seriously impaired, the deficiency can be made up from the Pacific. According to a San Francisco journal, 583,000 cod-fish were taken by seven vessels off the coast of Alaska in the summer of 1873. No estimate can at present be formed of the captures off the Banks of Newfoundland and the coast of Norway. New cod banks have lately been discovered off the coast of Spitzbergen.

The trade in frozen herring off the coast of Maine and in the Bay of Fundy continues to be of great importance. This comparatively new interest has been increasing gradually for many years, and now employs a large force during the winter season. The fish are taken in gill-nets and immediately frozen, and then shipped to the western markets of Portland, Boston, New York, etc. The Bay of Fundy is particularly favorable for this trade; and the recent establishment of a signal station at Eastport has been of great moment, by enabling those engaged in the business to anticipate the occurrence of a period of hot or cold weather in time to take measures to protect themselves from loss. The application of the signal telegraph in the service of the fisheries in the United States is comparatively recent, and promises to be of great benefit by communicating information of the occurrence of schools of fish along the coast, and of their movements, to those interested in their capture.

Another application of the signal telegraph is made by the dealers in fish both on the lakes and the sea-board, who regulate their orders and shipments of fresh fish by the knowledge thus obtained of impending atmospheric conditions.

The American salmon trade continues to increase, and the number of establishments engaged in canning and preparing them for market on the Columbia River and in Puget Sound becomes larger every year. It would almost seem that the vast numbers taken for this purpose must soon bring about their extermination, but as yet no perceptible decrease is reported. Numbers of these fish are brought fresh to the East in refrigerator cars to supply the market earlier than the period during which the eastern salmon can be taken.

In view of the great increase of the halibut fisheries off the coast of the United States, the hardy fishermen of Cape Ann, who more especially carry on this branch of industry, are obliged to resort to distant seas to obtain a supply; and even Greenland is not too far for their efforts. The coast of Iceland, too, has also been visited by a Gloucester vessel for this purpose; but, although the halibut were abundant, the stormy nature of the region and other impediments rendered it impracticable to continue the effort.

A rapidly increasing trade is that connected with the menhaden, mossbunker, or pogey, (*Brevoortia menhaden*), a large species of the herring family valuable for the oil and scrap—the refuse after extracting the oil from the boiled fish, which is used in direct applications to the land, or in the manufacture of fertilizers. Some idea of the magnitude of the interest may be learned from the fact that in 1873 sixty-two factories were in operation on the coast of New York and of New England, requiring the use of 383 sailing vessels and 20 steamers, the factories and vessels employing 2,306 men, with an investment of \$2,388,000. The total catch of fish amounted to 1,193,100 barrels (250 fish to the barrel), yielding 2,214,800 gallons of oil, and 36,289 tons of guano. The oil is used principally in dressing leather, and to some extent in rope-making and for painting, but not as yet for lubricating.

Another increasing fishery in the United States is that relating to the sturgeon, which, though abundant, has been

but little utilized, thousands annually taken in pursuit of other fish having usually been thrown aside as worthless. Now several dealers on the lakes, especially the Messrs. Schacht, of Sandusky, are entering into the trade, and manufacture caviar, isinglass, and dried smoked meat in great quantities.

The demand for fish-sounds continues very great, and the shores of New England and the provinces are carefully gleaned of all air-bladders procurable of the cod family. Of the species, the bladder of the hake is most sought after, bringing about one dollar a pound, and is used chiefly, it is said, in the manufacture of gum-drops.

The seal fishery during 1873 has also been very productive, the number taken at the Fur-Seal Islands in the Behring Sea being up to the maximum—namely, 100,000. The seals resort by millions to these islands, and it is said that a considerably larger number might be caught without any detriment to the trade. The capture of the hair-seals off the coasts of Labrador and Newfoundland, although less extensive than in 1872, has also been a source of very great profit. This business is now carried on entirely by steamers, of which not less than twenty belonging to Newfoundland were occupied, some of them getting two full cargoes. The largest catch of any vessel, it is believed, was about 42,000; these having been taken in the course of a few weeks, and, from the skins and the oil, yielding an immense profit.

The rapid decrease of lobsters on the coast of the United States, and the extent of the interest connected with canning them as an article of food, has induced a special effort to bring back the supply. The amount of this interest may be appreciated when we are told that during 1873 more than twenty thousand tons of canned lobsters were brought into the United States, or shipped elsewhere, from the shores of New Brunswick and Nova Scotia alone. An ordinance has been issued by the Canadian authorities prohibiting, under severe penalties, the capture of any lobsters weighing less than a pound and a half; and Massachusetts will probably enact a law prescribing a limit of size—namely, a minimum of eleven inches in length. In Maine, the legislation anticipated is that of a close time of two or three months in the summer, when none shall be taken, but imposing no restriction at other seasons as to size or weight.

The oyster fisheries, as far as the canning interest is concerned, suffered a severe shock during the financial panic, from which it has not yet recovered, although the consumption of the oyster while fresh is perhaps as great as usual. Vessels now carry entire cargoes from Maryland and Virginia to England, where they are becoming an established article of trade.

It will be of interest to announce that the United States Fish Commission is experimenting on a method of effectually freeing beds of planted oysters from the ravages of the starfish, so destructive to them.

Much valuable information has been obtained in reference to the fishery statistics, and the conditions affecting the fisheries generally, by the labors of the United States Fish Commission, which continued its investigations under the direction of the Commissioner, Professor S. F. Baird, assisted by Professor Verrill, on the coast of Maine during the summer of 1873. Detailed information was obtained in reference to the habits of the herring, cod, and other useful food fishes, which will have an important bearing on these interests. Numerous questions in reference to the preservation and reproduction of lobsters and oysters were also met. One result was the frequent capture of two-year-old shad in gill-nets many miles out to sea.

In connection with the subject of the fisheries, the modern methods of preserving fish fresh for an indefinite period of time should not be lost sight of, especially as their introduction has imparted immense activity to the trade in fresh fish, and enables the dealers to supply salmon, shad, Spanish mackerel, bluefish, striped bass, etc., at all seasons of the year.

Of these devices there are two principally in use, one consisting in placing the fish in sealed metal boxes in a mixture of ice and salt; and the other, much more convenient, being the construction of a chamber inclosed within double walls, and filled with the same mixture. The fish are placed in the centre apartment, the temperature of which can be readily maintained at from eighteen to twenty-five degrees above zero, and are preserved indefinitely. It is only necessary to renew the supply of the mixture every week or month, according to the mass, and the temperature above referred to can be kept up indefinitely. Some establishments in New York and elsewhere keep many thousands of pounds of fish in this way, subject to call at any time.

The various methods of increasing artificially the supply of fish and other marine animals, technically known as Pisciculture, have been prosecuted with increasing vigor during the year 1873, the earlier experiences warranting the adoption of more enlarged plans for securing the desired result. Associations have been formed, and State commissioners appointed, while numerous private establishments have been erected. The most important action in this direction is that taken by the United States Fish Commission, established in 1871, which is now largely occupied with this work, in addition to special researches in reference to the condition of the fishing interest on the sea-coast and lakes.

The measures adopted have had more special relation to the multiplication of shad, salmon, and whitefish; and in these operations the United States Commission was fortunate in securing the assistance of Mr. Seth Green, Dr. J. H. Slack, Mr. Livingston Stone, and other fish-culturists. Its operations have been conducted on a much larger scale than by any other nation, and with very gratifying success.

With a view of securing a sufficient supply of the eggs of the California salmon, Mr. Livingston Stone, as in the previous year, was sent out to the United States salmon-breeding camp on the McCloud River, near Mount Shasta, where he obtained about a million and a half of eggs which were shipped to the East (a portion to Utah), and about half of them successfully hatched out, at various State and private establishments, and placed in different streams in the Northern, Middle, and Western States. The more important waters supplied are several streams in Maine and Massachusetts, the Connecticut, Hudson, Delaware, and Potomac rivers, Lake Champlain, Lake Ontario, Lake Erie, and Lake Michigan, and the Ohio River.

During the year, also, the establishment at Bucksport, Maine, under Mr. Atkins, continued its operations, on an enlarged scale and with very satisfactory success. While the salmon are seined when wanted on the McCloud, at this establishment they are purchased living from the fishermen, who capture them in weirs in the months of June

and July, and place them in a large pond, to await the period of reproduction. Here they remain until October or November, when the instinct of spawning seizes them, and they run down into the outlet of the pond, where the hatching-works are situated. The spawn is removed by gentle pressure into a vessel, and fertilized, and the parent fish returned alive to the water, and allowed ultimately to run down to the sea. Previously, however, they are marked by a label, so as to determine whether any come back again; and in this event to ascertain the growth and increase of weight in the interval, their original length and weight being recorded.

These eggs are then brought forward to a proper degree of development, and finally distributed to State Commissioners, by whom the operation is completed, and the young placed in the public waters of the States. It is expected that, as the result of the operations of these two establishments during 1873, not far from three million young salmon will be planted in the eastern, middle, and northern waters of the United States, including those placed in the tributaries of the Great Salt Lake.

Another enterprise of a similar character has been the erection of an establishment for the hatching of the eggs of land-locked salmon on Sebago Lake, in Maine, in which the Commissioners of Massachusetts and Connecticut have united with the United States Commissioner. It is hoped that, when this is fairly in operation, a large supply of this most valuable food fish will be secured.

Operations looking toward the multiplication of shad in American waters, both on the part of the United States and of some of the States themselves, have also been conducted on a large scale. The work was prosecuted by the United States on many of the coast streams from the Savannah River to the Penobscot, and large numbers of young fish were not only turned into the water at the points where they were hatched, but transferred to tributaries of the Mississippi and of the great lakes. A successful shipment was also made to the Sacramento River of 35,000, and a small number to the Jordan, a tributary of Great Salt Lake.

As in previous years, Massachusetts, Connecticut, and New York carried on similar operations for the benefit of the local waters, while a beginning was made in the same direction by the Commissioners of Pennsylvania in the Susquehanna River.

The cultivation of whitefish has also been prosecuted with great zeal, particularly by the States of Michigan and New York, while a considerable number belonging to the United States Commission was sent to the Commissioners of California, and by them successfully planted in the waters of Clear Lake.

The operations in connection with whitefish have of late years been prosecuted on a very large scale by the State of New York, under the direction of Mr. Seth Green. In 1873 the State hatching-house at Caledonia contained about 3,000,000, which were duly planted when hatched. The number was less in 1873. In 1872 the United States Commission engaged the services of Mr. N. W. Clark, in connection with the whitefish eggs, and transmitted about 400,000 to the State Commissioner in California. In 1873 the State of Michigan collected a large number of these eggs for introduction into its own and adjacent waters. This fish, as is well known, is the most important of any species taken in the lakes, and it is fortunate that the method of their artificial propagation proves successful, and promises so satisfactory results. Only by such a process can the enormous waste and drain caused by the fisheries as at present prosecuted be met and replaced, an expenditure of ten or fifteen thousand dollars per annum being sufficient to secure the return in value of many hundred thousand dollars in productive results.

The discovery of a species of grayling (*Thymallus tricolor*) in certain rivers of Michigan, has suggested the importance of making this fish more widely known, by introducing it into appropriate waters elsewhere. Fish of this genus are much esteemed in Europe, both as an article of food and as furnishing excellent sport in their capture; and the American variety will probably be much sought after when arrangements can be made to supply the spawn in sufficient quantity.

A very important advance in the artificial propagation of fish was made by Seth Green and party while in the service of the United States Commission, in the discovery that striped bass, or rock-fish (*Morone chrysops*), may be bred as easily and in much the same manner as the shad; special effort will probably be made during the coming year toward increasing the supply of this most valuable fish.

STOCKING STREAMS AND PONDS.

BY A. S. COLLINS.

THERE are comparatively few waters in the United States which can be stocked with brook trout. This assertion may be thought very singular, especially in view of the numerous trout streams in the New England and Middle States. But when we come to compare the number of trout streams with the number of warmer streams, lakes and ponds in this country, it will readily be seen that the assertion is true. And since such ponds are far greater in number, their proper stocking is of much more importance than the proper stocking of brook trout streams.

Very little attention has hitherto been paid to this subject. Fish Culturists have had their attention directed almost exclusively to the brook trout, because it is the highest priced fish coming into our markets, and one whose culture is supposed to pay the best. Our ponds and streams have up to this time naturally abounded in fish. Labor has been scarce in this land and well paid, and our people could afford to give high prices for food. But just in proportion as our population increases, and our virgin soil loses its productiveness, will the necessity arise for either cheaper or more nutritive food.

Almost every farmer in our country has or can make a pond on his farm. A good proportion of his own food could be grown there, and a revenue derived from its surplus.

I do not pretend to say that we know just how to do all this at present. On the contrary, we know very little about the breeding and preservation of such warm water fish as

we have; and it is probable that many foreign varieties, if introduced here, would give better results than the fish already found in our waters. These matters it is now the province of the aquaculturist to investigate. The habits of the salmonidae have been thoroughly studied, and the breeding of the shad has been made a perfect success. Here and there we have progress to record in a new direction. A good deal is known about the perch. The eggs have been successfully taken and hatched, and something is known of their habits and food. The eggs of the pike perch, or wall eyed pike, have been artificially hatched, but the results of the experiments have not yet been entirely satisfactory. A commencement was made on the striped bass last year by Holton, (by whose untimely decease fish culture loses much.) But the bass family have thus far turned a deaf ear to the voice of the charmer, and their domestic arrangements are still carried on without the aid of the American Fish Culturists' Association.

I meant to say something about stocking ponds with bass, &c. and shall have to defer it till another time. But I have noticed some of the points on which fish culturists in this country are pretty well informed and the directions in which they are now at work. Our object is this: The supply of water, range of temperature, &c., of any pond or stream being given, to find the best fish for that place, the means of feeding fish at a less cost than its market price, and the means of having an annual crop for market and still keeping up the supply.

Caledonia, N. Y.

AN IMPORTANT AMENDMENT.—The amendment suggested by George Sheppard Page, Esq., at the recent convention of the American Fish Culturists' Association, and carried, is a most excellent one. There should be nothing like exclusiveness about the action of the American Pisciculturists. The amendment was to change section 2d, article 2d of the Constitution, by striking out the words, "All Fish Culturists," and inserting the words, "any person." So that to-day any one is eligible to membership in the Association. This most excellent change will much increase the influence of the Association.

—Various methods have been devised to aerate the water in transporting fish, so as to avoid the necessity of changing it. The oldest is an air-pump attached to the side of the tank, by means of which air is forced into the lower portion of the tank, and the water is recharged with oxygen. A recent one, suggested by one of Commissioner Slack's assistants, consists of a tin cylinder, about eighteen inches in length and three or four inches in diameter. A loop-handle crosses one end of the cylinder, and the other end is closed, forming a bottom. The sides and bottom are pierced with numerous small holes. When the cylinder is forced downward, into the tank, the water rushes in through the perforations, and as the cylinder is withdrawn the water rushes out, creating great ebullition of air, which, of course, reimpregnates the water to a very considerable extent.

—An interesting peculiarity in the habits of some Indian Silurid fishes has been noticed at a recent meeting of the Zoological Society of London, by Surgeon F. Day. Mr. Day, when fishing at Cassegode, found that, after having caught a large number of specimens of various species of *Arius* and *Osteogobius*, there were several silurid eggs at the bottom of the boats, and in the fish-baskets. These eggs were, on an average, half-an-inch in diameter; and on looking into the mouths of several of the males of both genera, from fifteen to twenty eggs were seen in each; those in the boats and baskets having evidently dropped out from a similar situation. The eggs were in different stages of development, some advanced so far as to be just hatched. They filled the mouth, extending as far back as the branchiæ. No food was found in the alimentary canal, though in the females it was full of nutriment.

—In Brewster, Mass., Messrs. Parker and Winslow are interested in the laudable pursuit of trout raising, and have a pond which contains 1,000 two-years'-old; 2,000 one-year-old; 80,000 spawn have been taken the last two months, and 50,000 young are now in the different stages of development. There are two kinds, the salmon trout and brook trout.

—The Waldoboro' News, Me., says that Messrs. Everleth & Weston received at their Trout Breeding Establishment in that town Wednesday, 18th, 100,000 salmon eggs. They were sent there from the State establishment at Bucksport, for the purpose of being hatched. They will then be used for stocking the Medomak and Georges Rivers with salmon. Dr. Everleth thinks they will have attained a sufficient growth to place in the brooks running into those rivers sometime in April. Messrs. Everleth & Weston have about seventy thousand young trout just hatched, and several thousand, one, two and three years of age. Salmon eggs are about the size of an ordinary pea, and through the transparent shell the young fish can be plainly seen and their motions observed.

—Mr. Ellis Weston, of Wenham, Mass., has transported 500 young trout, of his own raising, to West Falmouth, with which to stock a pond for Dr. Thayer, of that town. Mr. Weston has excellent conveniences for conveying trout, and those wishing to stock ponds could not do better than to negotiate with him.

ROCHESTER, February 2, 1874.

EDITOR FOREST AND STREAM:—

I see in FOREST AND STREAM, of February 26, that Mr. J. H. C. criticises my article on propagation of lobsters, published in the N. Y. Times. Now if Mr. J. H. C. will sign his full name I will answer any article he may see fit to publish on Fish, Frog or Lobster Culture.

Yours,

SETH GREEN.

—Seth Green is in trouble! His most precious fish is (s)pawned.

Woodland, Lawn and Garden.

PARLOR OR WINDOW GARDENING.

CONCLUDING NUMBER—THE SUB-TROPICAL.

"Fair forms of flowers, and chiefly that tall fern
So stately, of the Queen Osmunda named;
Plant lovelier in its own retired abode
On Grassmere's beach than Naiad by the side
Of Grecian brook, or Lady of the Mene,
Sole sitting by the shore yf old romance."

PROGRESS of window gardening, as developed in the sub-tropical arrangement of plants made the first portion of this continued paper from No. VIII. In this concluding paper we take up the subject at the point we left the same. We had carried our pupil through the various preparatory arrangements of box making, and of filling the box with the different kinds of earth necessary for the successful cultivation of the plants we had named. We left our window garden still in an unfinished condition, but really perfect in all its parts as far as it was completed.

Having your soils correctly prepared for the different kinds of plants, you are now ready to introduce around the sides and at the base of your aquarium the representatives of many climes and the denizens of many soils. This you will notice is a very nice work, and you will fail of success if exceeding carefulness is not exercised. In giving the above directions, I have aimed at making my remarks as plain as possible to the end that there may be no failure of success on the part of those who venture to follow out my suggestions. And there need be no failure if the necessary care is exercised.

Did you never visit in mid-summer some deeply shaded glen—a ravine, perhaps—of some few feet only in width at the bottom, walled up on each side with an almost impenetrable wall? Such a wall you would scarcely think of climbing. You stand still beneath the deep, dark foliage of the overhanging trees; you look with rapt enthusiasm upon the creeping mosses, the overhanging ferns, and delightful tracery that adorn its steep ascent. All this vision of loveliness is before you, and you drink in like an inspiration from paradise the fragrance of many flowers. You listen to the murmur of the brooklet that rolls sparkling at your feet, and feel that all this beauty is but a dream—cannot be a reality; and if the reader would have a better conception of what we here describe he may behold just such a beautiful transcript of nature in the ravine of the Wissahawkin. Such places as this, and far more beautiful, have I seen, and which at certain seasons of the year glowed with all the gorgeousness of an Oriental paradise. From such wild and beautiful places of earth the true inspiration of high art is drawn. And the educated landscape gardener who cannot take his scrap book in hand, and with his pencil and brush transfer a portion of all this beauty to its pages, to be again recreated, is unworthy to practice so noble, so elevating an art. And here is where I would have you study well the crude models you may chance to look upon in your daily outdoor walks. But be not a copyist, or a servile imitator in minute details, but receive the hints nature is ever holding out to you, and from them make a grand study. True, the out-of-door rockery, with its broad base rising from a well planned lakelet, the shady island, with its grandeur of evergreens, are objects well worthy of your study and imitation, and of which we may speak more fully hereafter. So are our miniature tropical plants within our winter parlor windows equally beautiful, and require, in fact, more of the artistic treatment than our lakelets and islands. We proceed now to the closing up of our window garden in the parlor, and the closing up of our already long and (perhaps to some tiresome) elaborate series of articles upon indoor gardening.

Your arrangement of a large box, and the addition of a Wardian case of ferns, or a parlor aquarium, can now be made with very little work and care. You will set either of these adornments within the centre of your box of earth, and add to your plants already placed such large leaved plants of tropical character and habits as may best suit your fancy. We name a few only of easy cultivation among the water loving plants—the *calla lily*, *calladiums* (different kinds), *cannaes*, *Begonia rex*, ferns (as the *Grammopis excelsia*), *dracaenas*, *maranta*, *tradescantia*, *bambusa*, *hedychium*, etc. The *Caladium violaceum* is a fine plant. The *Aralia sieboldi*, *orchids*, etc., may be placed amid the crevices of the rock work with fine effect.

If an aquarium is placed within this window you can make choice of any form that may suit your fancy, and the necessary kinds of water plants; wherewith to plant, and the fish to place in the same, will be cheerfully furnished by the one of whom you purchased your aquarium.

Thus we have carried you through a series of eight numbers concerning the different styles and manner of growing plants in winter with ordinary care. And wishing you every success and encouragement for your labor, we subscribe ourself

Yours to command,

OLLIPOD QUILL.

TRANSPLANTING EVERGREENS FROM NEW BRUNSWICK TO MANITOBA.—The Fredericton (New Brunswick) Express mentions the interesting fact that Mr. Lester Stockton, of Kings county, N. B., has succeeded in acclimating evergreens, including spruce, fir, pine, hemlock, etc., in portions of Manitoba where evergreens have been hitherto unknown. His first batch was forwarded in the spring of 1872, which, after a nine week's journey, were planted,

grew, and flourished, and since that time he has received several orders. The most thrifty but smallest plants are selected, and put up in packages of one hundred, weighing four pounds, the postage on each bundle being one dollar. They are placed root to root, imbedded in a little earth, moistened with water, then covered with moss, and finally wrapped in oil cloth. A small hole is made in the end of each package to admit air, thus preventing moulding.

In a letter from Greenville Portage, La Prairie, Manitoba, Mr. Alfred J. Green, formerly of Kings county, writes to Mr. Stockton in substance as follows:—"We have not any evergreens within a hundred miles of this place. The forest trees here are oak, elm, ash, and Balm of Gilead, or, as we call it, bass wood, cherry, plum, hazel, and thorn; flowers flourish in endless variety, but we miss the garden rose, the currant, and other New Brunswick favorites." Mr. Green also says that the last lot of evergreens received are growing rapidly, thus proving their adaptability to the soil and climate of the section of Manitoba where he resides.

This experiment and its successful results we consider of the utmost importance. The transplanting of trees from one section of the country to another may serve more than to simply beautify the landscape. When this subject of American forest culture is more fully understood we may be able to discover that certain trees thrive better when away from the places of their origin, and somehow we may master the problem of quickly replacing whole families of trees which have died out in sections of country once well wooded.

Natural History.

VARIETY IN PLUMAGE OF BIRDS PRODUCED BY DOMESTICATION.

PHILADELPHIA, February 26.

EDITOR FOREST AND STREAM:—

I would like through the medium of your columns to open for discussion a subject on which I have at times indulged in much quiet speculation. Let me ask if there is even a theory for the variety of colors we find in horses, dogs, cats, rabbits, (the rabbit proper, the burrowing animal,) chickens, and pigeons, and why do the colors of our turkeys, which in the wild bird from which they came are almost invariable, now present such variety? Some maintain that our tame turkey does not come from the wild species found in the United States, that it is a descendant of a species found at one time, and perhaps even now, in Mexico. However this may be, why have we such a diversity of tints in the domesticated bird. We are sometimes told that it is by promiscuous and inter-breeding that we get the mottled and parti-colored, and by following closely a certain strain and excluding communication with those just named, that we get the white, the slate colored, the buff, and the bronze. And that we so also establish permanently certain colors or combinations of colors in chickens.

After the crafty Jacob had made a compact with his father-in-law, Laban, as we read in the Book of Books, that all the he goats and those to be born that should be "ring-straked and spotted, and all the she goats that should be speckled and spotted" should be his property, the cunning man "took him rods of green poplar and of the hazel and chestnut tree, and piled white strakes in them," "and set the rods which he had piled in the gutters in the troughs, when the flocks came to drink," "and the flocks brought forth cattle ring-straked, speckled and spotted."

I have asked profound zoologists if they had ever given the matter thought as to the variety of color produced in animals by domestication. None had a theory or even hypothesis. And this trick of Jacob's as just related is the only theory that suggests itself to my mind. That the variety of colors, of light and shade, of active life in and around the farmer's homestead, so much at variance with the dark silence of the forests and open lands, attracting their attention and fixing it in their minds (if animals may be said to have minds—and I believe they have) at times of gestation, has had the effect we see in their offspring.

Another thought which has occurred to me, is that where the male of the oriental pheasant, the peacock, and hundreds of other birds are all of gay plumage, the females are clad in sombre hues, while in the genus *Homo* the reverse is the case, for the men wear the sedate hues and women and fools the gaudy colors.

Although this may appear an uninteresting matter to some of your readers, I have no doubt the same thoughts here noted down have occurred to many others, and if any of them can throw any light on the subject it would be time and ink well appropriated. Perhaps some of your readers who are chicken fanciers may have something to say.

As to the difference of colors between male and female in two species of *salmo* at spawning time, I refer to our ordinary brook trout and the salmon, there are no tints so entirely at variance. Every trout culturist has admired the vermilion, white-edged fins of the male, and deep orange below the lateral line contrasting so entirely with the sober, silver gray in which the body of the female is robed. The difference in the colors of the two sexes is even more distinct in the trout of the Maine waters. The entire broad sides of the males, (I am afraid you can even now find a few of them on the stands of some of your restaurants,) are all of a crimson. But the difference between the male and female salmon at breeding season I had no conception of until I saw the colored plaster casts of the two at the Smithsonian Institution. The fish were sent

from Bucksport, Maine, by Mr. Atkins, just after the spawning. The male as brilliant, (though rather in splashes than over the whole body,) as the Maine cockfish, while the female was a poor, depleted looking mother of perhaps ten or fifteen thousand embryos—shrunk likely to one half or even a third of the weight she was on her arrival in June from her marine feeding ground. I suggested to Professor Baird, who was with me, that the cast of the cockfish was too highly colored. He assured me on the contrary that it was rather under colored.

Won't some of your readers try to throw some light on the variety of colors produced in the domestication of animals?

THADDEUS NORRIS.

THE HERONS AND THEIR LANTERNS.

Is it really a scientific fact that all the species of heron have the faculty of emitting a light from their breasts, as a glow-worm does from his body, and that this light is employed in some measure to enable these birds to pursue their nocturnal fishing with success? This is a wonderful gift of nature, and shows the adaptiveness and fitness of all things in the creation, for fish are attracted by light, and without his lantern the night heron might be often compelled to go supperless. If any of our scientific friends will describe this lantern and tell us how this luminosity is evolved, such information will prove most interesting and instructive to our readers.

WASHINGTON, D. C., February 26, 1874.

EDITOR FOREST AND STREAM:—

Some years ago in working for snipe and curlew along a marsh near Swatow, in China, I shot a heron. I believe it was a blue one. On his breast there was a peculiar tuft of filaments, more like coarse hairs than feathers—more like the tuft on a gobbler than anything else—of a pale yellow; this was under the feathers. An old sailor told me I must cut this out as it would spoil the flesh as an edible—that at night this tuft gave out a light, and by this light the bird attracted and saw its prey—small fish. I have mentioned this since to several persons, whose knowledge of Natural History I had great confidence in and have been assured I was mistaken; that no bird of the heron family possessed such powers, and I gave the matter up. But to-day, in looking over your index, I referred back to the items, and find that in No. 5, page 75, your correspondent S. W. Hammond distinctly describes this peculiarity, and on page 105 an article on the habits of the heron, speaks also of it.

As I know that there is doubt upon this subject, will you kindly open your columns to communications from any who may be able to settle it.

PISCO.

DO QUAIL WITHHOLD THEIR SCENT?

CARSON CITY, Nevada, February 27, 1874.

EDITOR FOREST AND STREAM:—

"G. H. M." of Baltimore, is of the opinion they do, and I see by issue February 5, page 406, that you hold the same opinion. I never had the pleasure of hunting quail in the Atlantic States, but have had over twenty years' experience on the Pacific Coast, from the mouth of the Columbia River to Cape St. Lucas, and have paid particular attention to this subject. I have come to the conclusion that the quail of this country do not withhold their scent either voluntarily or involuntarily. I have had dogs with first-class nose walk over them, it is true, time and again, but it was invariably in the heat of the day when everything is dry. I never have any trouble when there is any dew, or if it is a damp day, nor after a bevy is finished, if they alight on damp ground, let them be ever so frightened or nervous. I believe the scent is always the same as far as the quail is concerned, and that it all depends upon the conductor. If one could have quail on snipe ground he would find no fault with the dog's not pointing quickly enough.

If Mr. G. H. M. will take two dead quail—let one be perfectly dry, the other a little damp—and hide them in the grass and send his retriever for them the dog will walk over the dry one and fetch the wet one every time.

Yours truly,

H. G. P.

[We are not of the opinion that "quail have the power to withhold their scent." On the contrary, we have stated the scent is so slight, at certain times and seasons, owing to the atmosphere and dry herbage, that the odor is not perceptible to the keenest nose dog, but that the birds have the power to retain or emit scent as a natural instinct, we have no positive means of determining.]

HYBRID DUCKS.

SMITHSONIAN INSTITUTION.
WASHINGTON, D. C., February 27, 1874.

EDITOR FOREST AND STREAM:—

Since I last wrote to you of a Mallard-muscovy hybrid, the Smithsonian has received another example of cross fertilization in the case of a mallard with a pintail (*Drasila acuta*). The specimen was received from Dr. Velle of Chicago, where it was obtained and very beautifully mounted. The parentage of the individual is unquestionable, so nicely are the characters of the mallard and pintail balanced. The head and upper neck are intermediate in color between the glossy grass green of the mallard and the peculiar purplish-violet-gray of the pintail, with indication of the black, white-bordered stripe that in the pintail runs up the back of the neck. There is a white collar incomplete behind (mallard and pintail). The breast is strongly washed with chestnut (mallard). The speculum on the wing is grass green, bordered in front with rich cinnamon (pintail). The general coloration of the back and sides is intermediate between the very fine waving of the mallard and the coarser vermiculation of the pintail, with an attempt at the scapular stripes of the latter. The sides of the flanks are snow white; the under tail coverts jet black. The lateral tail feathers are gray, white bordered (chiefly mallard). The hybrid is finished off most completely in the two middle tail feathers. These, in the mallard, are, as is well known, short and curled into a complete circle; in the pintail they are very long, slender and arrowy—here they are both long and curled, reaching an inch beyond the rest, and gently curved upward in the arc of the quadrant of a circle.

This bird corresponds exactly with one described by Prof. Alfred Newton of Cambridge, the eminent English ornithologist, in the proceedings of the London Zoological Society for June 26, 1860. It is almost a fac simile of the upper right-hand figure of plate clxviii, *op cit*. It is the first instance of the particular hybrid noted in this country, I believe—certainly the first that has come under my own observation. Prof. Newton's specimens were of special interest, being hybrids of the second generation, that is to say, offspring of the interbreeding of a pair of birds which were themselves hybrids between a pintail drake and a farm-yard duck. A case like this refutes the prevalent impression that hybrids between distinct species are infertile. Such may indeed be the rule, but the exceptions are very numerous. Prof. Newton found that his hybrids of the second generation, however, were probably sterile, and adds that though the hybrid offspring of the two animals clearly distinct may of themselves be perfectly fertile, it is not proved that this fertility extends to a second generation.

The prevalence of hybridity in some groups of birds is not generally known—at least not fully recognized. On this subject Prof. Newton's remarks, in the article just quoted, may be quoted: "The tendency, under certain circumstances, to polygamy which obtains among many of the ducks, combined with their natural salacity, is such as to render that

family perhaps the one of all others in which experiments on hybridism can be the most easily tried. The frequent occurrence of hybrids among the *Anatidae* has already attracted the notice of ornithologists, and among them one of the most distinguished European naturalists, M. de Selys-Longchamps, who in 1845 enumerated no less than twenty-five different crosses produced between various members of this family, and who, eleven years later, was enabled to raise the number to forty-four. Others have also been recorded. Although by far the greater proportion of these crosses take place in a state of partial domestication, there can be, I think, no doubt that some occur among birds in a wild state."

Yours truly,

ELLIOTT COUES.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS,
NEW YORK, February 28, 1874.

Animals received at Central Park Menagerie for the week ending February 27, 1874:

Two Elands, *Oreos canna*. Hab. South Africa.

One spotted Hyena, *Hyena crocuta*. Hab. South Africa.

Ten Macaque Monkeys. Hab. East Indies.

W. A. CONKLIN.

New York, February 21, 1874.

EDITOR FOREST AND STREAM:—

Being a great lover of birds, I was much interested in the notes on Albionism, published in your last issue. Yesterday I happened to cross the City Hall Park, and noticed a specimen of Albionism among the sparrows. It was a male, almost entirely white, the only markings being on back and two middle feathers of the tail. The bird remained quiet on the walk for nearly a minute, so that I had an excellent opportunity to verify the fact that he was a genuine Albino.

G. F. W.

—A curiosity is to be seen at Charleston, S. C. It is a milk white deer a year old, which has been killed in a herd of six on Dewees' Island. It is to be placed in the museum at Charleston College.

The Kennel.

PURENESS IN SETTERS.

EDITOR FOREST AND STREAM:—

I have read the FOREST AND STREAM, of February 19, and notice you have published a part of my letter to yourself, with the reply I received and have given the two the heading, "Pureness in Setters." Would it not have been more appropriate in view of the nature of the controversy between us to have styled the article "Pureness in Setters of Philadelphia," and given my letter entire for perusal? more so for the reason that the argument began in a comparison of a particular dog to animals of my own immediate neighborhood. Not for one moment could I be expected to give such pedigrees as you refer to; nor can it ever be done in this country, unless our sportsmen are more particular in breeding their dogs, and it was in this wise you and I disagreed on the good points and setter characteristics of the pup. All I wished to know of his pedigree was a straight line of only three generations, (two would have sufficed,) provided sire and dam, grand sire and grand dam had been good performers. It is strange to me that we Philadelphia heretofore, in a measure, only careful to know of the good performances and general good name of sire and dam, grand sire and grand dam have had so many fine acting dogs, but I must say we have been very particular that setters we own or choose as pups should possess certain characteristics which in a good dog are never wanting.

I am positive had you tarried long in our Quaker city during the seventeen years experience in regard to dogs you speak of, you would not have named fifty as the number that could boast of ancestral blood, among the thousand you have met; nor can I see how any of our American setters could be of German blood, unless such German dogs were first taken to England and palmed off on us as British animals; certainly England is of easier communication, and the class of Germans coming to this country never bring sporting dogs with them.

In writing you that all setters in America come from the parent stock, English or Irish dogs, I spoke in a broad sense, and will furthermore say all setters in the world came originally from the English dogs, and I only repeat the opinion of Herbert, Youatt, Dinks, Mayhew, and Hutchinson.

I have assurance from many of the Philadelphia Sportsmen's Club that we can enumerate more than fifty setters having English and Irish blood in their veins. Messrs. Sinnickson, Johnson, Abbott, Sartori, Sharpe, Smith, Logan, Twaddell, Crooks, and Seitzinger, all have dogs whose pedigrees can be traced directly to imported stock.

I add the pedigree of the once famous dog "Hark," of De la Cuesta, whose exploits in his time were wonderful, and the wagers were numerous, and give it as his owner handed it to me. "Hark," the well known setter dog of Philadelphia, was pupped on the 15th of May, 1841, out of the celebrated bitch "White Rose," of Washington, Delaware, and at that time her stock dated back twenty-three years; he was by a red and white setter, (the property of Mr. Wm. Robinson,) gotten by a large Irish setter, belonging to Sheriff John Cork, imported from Europe and brought over by Captain Smith expressly for the Sheriff of New Castle, Delaware, landed and delivered to him there.

The pedigree of "White Rose" I could readily have obtained from Mr. Gilpin, the gentleman we were speaking about, but unfortunately he is no more; still, it can be gotten by going to Delaware for it, if necessary.

I will add that some of "Hark's" descendants are still living, and deporting themselves admirably.

Mr. De la Cuesta states to me in getting his dog "Hark" into condition for a trial of merit, he never thought of feeding him on raw beef, nor would he dream of giving such food to a hunting dog during the shooting season, for he is convinced it impairs the nose of a dog; in lieu of flesh he provided a preparation of oat-meal with the extract of beef, or such as greyhounds are fed on in England, when they are being gotten into shape for running.

"Homo."

TRAINING PUPPIES.

NEW HAVEN, Conn.

EDITOR FOREST AND STREAM:—

I have read with interest numerous articles in your paper upon the subject of training sportsmen's dogs, and the ease and grace with which some young dogs take to their work over others has been noticed, without giving any apparent reason for the difference. That there is a wide difference between dogs of equally good strains of blood in this particular, all sportsmen readily concede, while but few can give a reason for the distinction even satisfactory to themselves. To me the reason is obvious, and it lies in the marking process, by which pups are born, good, reliable, staunch hunters, and take to their work with a naturalness and pleasure from the first. The owner of a shut should always be very careful in crossing with a dog of good blood and reputation, and at a proper time let him exercise her frequently in the field, upon such game as may be in season, giving her proper enjoyment in the hunt, and she will mark every pup so that they will be born good hunters, and no breaking process will be required. I have seen pups only four or five months old exhibit as much caution and sagacity in the presence of game as dogs of half a dozen years of practice with sharp training will do, and this entirely attributed to the marking process which, in my judgment, is the cause of the wonderful precocity of some young dogs mentioned from time to time in the columns of your paper. I am a thorough believer in the marking process, and throw out these suggestions in hopes that some of your readers will give us the result of their observations, and if there is anything in this theory, much practical good may result from a general diffusion of information upon the subject.

among sportsmen. When this theory is better understood and observed, I believe we shall have better working dogs, with less tax upon our patience. A bird dog with good blood thus bred will always have a natural —and I almost said, controlling desire to do just the work you wish him to do without whipping or scolding, and he will do it with naturalness and with real pleasure to himself and master. So strong and controlling is this principle that hybrids are sometimes fairly metamorphosed into tolerable hunters by this marking process by the mother, without which they would have been good for nothing in the bush or in the field. Hoping these suggestions will call out the views and observations of others, I subscribe myself

MARK.

WORKING DOGS AT FIELD TRIALS.

RHWILAS, BALA, NORTH WALES, February 16, 1874.

EDITOR FOREST AND STREAM:—

I was surprised to receive your letter, dated January 24, stating that since my first communication you had never heard from me, but your letter dated January 31, and this day received, satisfies me that at least one of my letters has come to hand. I am glad you have written to the Secretary of the Kennel Club. An important affair like this international match is, in my opinion, much more likely to be satisfactorily carried out when managed by a well-known and influential body of gentlemen like the Kennel Club than by a single individual or two, as Mr. Macdonna and myself. Now to proceed to answer some of your questions.

Retrieving is not recognized in English field trials. We reckon that it renders a dog unsteady and liable to rush in on the fall of the bird, if in the habit of retrieving the dead, frequently putting up other live birds before the gun is loaded, and making the other dog unsteady in backing. An instance occurred at the last field trials held at Ipswich in September last, where Mr. Field's "Daisy," a very first-class young setter bitch, misbehaved in this manner, and although she divided the stake, she would doubtless have done better had she not run in at the dead partridges.

A breaker is allowed to speak to his dog, say "steady," "to-ho" or what he pleases, and direct him by the whistle or hand, but it is considered more creditable to a man to be quiet, and the best broken dogs never require more than a wave of the hand. "Belle" works to signal entirely, and a word is never uttered to her the same "Ging Baby" and Don. Prizes are given to the men who work their dogs in the best and quietest manner; a commendable distribution much in vogue of late, invariably goes to the men who make the least noise. Our dogs do not point snipe or woodcock, as a rule; certainly not at field trials. A dog at trials must be perfectly free from any tendency to chase "fur," either hare or rabbit; a well broken dog either drops instantly at sight of a hare or rabbit, or goes on with its range, taking no notice of the animals.

R. J. LLOYD PRICE.

A PLACE FOR THE DOG TRIAL.

DALLAS Co., Iowa.

EDITOR FOREST AND STREAM:—

In your last issue you say that perhaps it may be my good fortune to designate the ground for the coming dog trial. I must confess that I should be quite proud of the honor if it were conferred upon me. I have a place in view which I think cannot be surpassed. It is on the railroad. Game is plenty, and the town can, I think, accommodate five hundred people, and would be very glad to do it at reasonable prices. I think that half fare rates can be procured from Chicago, and there will be no change of cars this side of that place. Places could perhaps be found further east that would do; but perhaps nearly all who attend will want to stay for a few days' or weeks' shooting, and the shooting *par excellence* cannot be had there. I have no pecuniary interest whatever in wishing to designate the ground, and unfortunately have at present no dog worthy of exhibition.

O. H. HAMPTON.

—One of the finest dogs in the world is said to be a liver-colored Spanish pointer owned by Mr. Dabney, the American Consul at Fayal; it is a double-nosed pointer.

—Last week a valuable hound belonging to C. O. Cony, of Augusta, Maine, took the scent of a fox, and was so intently following it along the line of railroad that he was run over by an approaching train and killed.

—Messrs. T. and I. Mersereau, 62 Duane street, are manufacturers of a new and elegant dog collar. The clasp contrivance is very simple and ingenious. See advertisement.

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

CANOEING.

THE FOREST AND STREAM desires to call the attention of its readers to a sport, which is in itself a variety of sports, and although but little known in this country, is of some years standing in England and has numerous followers there. "Canoeing" evidently means using a canoe of some kind and in some way, but the word canoe is so indefinite, applying equally well to numerous and totally different vessels both in construction and size, that at the start we must state that it is not our intention to recommend canoes in general but a particular type of boats so called. The Malaysian outrigger canoes, sometimes seventy feet in length, and which it is said have accomplished the surprising speed of twenty miles an hour under sail, although unquestionably very good in their own waters, would be hardly the boats to use in a trip through the Adirondack Lakes; nor would the "dug-out" of the Potomac and Chesapeake be selected for a tour through a country where numerous portages were necessary; and again we should not advise the use of the "birch-bark" for a voyage across the English channel.

All of these canoes are undoubtedly good in their way, but the ways are unfortunately local, and removed from the waters where they grow, they are of very little account. Now the canoe to which we wish to call our readers' attention, is a boat, which can be used with perfect safety and satisfaction in each and all of the places alluded to. She is emphatically a traveling boat, and one which seems perfectly at home in all the varied water of an extensive cruise, embracing seas, bays, rivers, lakes, and canals; nor is this

adaptability to variety of water her only or chief recommendation. An enthusiastic correspondent of one of our daily papers, writing on this subject some times since, credits her with possessing all the desirable attributes of a first-class hotel, which, we infer, is an allusion to singularly clean lockers for provisions, and the fact that *en voyage*, she is the traveler's house at each camping ground, doing away with the necessity of carrying a tent and its gear, which when stowed, is both weighty and bulky.

Mr. MacGregor, the inventor of these little vessels, first called attention to the fact of their existence by an account of his experience in his first canoe, the "Rob Roy." This name has since become the title of a class in contradistinction to various modifications of his original idea introduced of late.

Most of the canoes, now in use in this country, are of the "Nautilus" type, invented by Mr. W. Baden-Powell, and differ from the "Rob Roy" mainly in their having been constructed with a view to sailing rather than paddling. However, both classes are fitted with sails and paddle—the "Nautilus" canoe being unquestionably the more manageable under sail and the "Rob Roy" the faster with the paddle in ordinarily smooth water, but that the difference in result may be more clearly understood a brief description of each class is necessary. The general "Rob Roy" is a boat of from twelve to fourteen feet in length, two feet beam and about one foot depth of hold, double ended with the greatest beam amidships, decked completely with the exception of the well in the centre of the boat, in which the canoeist sits, and around which there is usually a coaming of about two inches in height. The general appearance of the boat is like a short clincker-built working-boat drooping towards the ends. In paddling in smooth water, this fact of having the sheer the wrong way, is rather an advantage than otherwise, as there is less resistance to the wind; but under a press of sail in any sea she is very apt to bury forward.

The Baden-Bowell, or "Nautilus" canoe, is quite different in appearance; generally of about the same length, beam and depth amidships, she has additional height at the stem post of about eight inches, and at the stern post, four or five inches, which gives her a very graceful sheer-line and makes her a much abler boat in a sea-way. Having airtight compartments in her ends, these in connection with her sheer, makes her self-righting. With the bulk-heads confining the air spaces, two feet from each end, she will be sufficiently buoyant when full of water to float the canoeist and any ordinary amount of stores and gear. The sails are so arranged that everything is worked from where the canoeist sits, and starting with his masts unstepped, he can without leaving the well, ship them, make sail, reef or furl, and in astonishingly short time. Were it not for the facility with which the canvas can be accommodated to circumstances, it would appear somewhat fool-hardy to make a long voyage in a vessel of twenty-eight inches beam and seventy-five square feet of sail, and with no artificial stability from ballast other than the discreet use of the canoeist's own body. And yet the English channel has been crossed in one of these tiny vessels and the perusal of Mr. MacGregor's books will show thousands of miles traveled by one man in this way.

There can be no healthier exercise than paddling, and to the boat-sailor, no greater enjoyment than managing these delicate crafts under canvas; and when to combine with these sports, shooting and fishing, necessitates only stowing your gun and fishing gear, we must say once more that to the canoe there is a variety of sports attached rarely found so condensed.

Although it will be impossible for us to give without diagrams such definite information concerning build and rig, that any of our readers could, without previous knowledge, design or superintend the construction of a canoe, we will in subsequent numbers endeavor to give some general items on the subject which may prove of help to any one intending to purchase or build.

THE BOSTON YACHT CLUB enjoyed its annual dinner at Englehardt's, on Hawley street, on Washington's Birthday. About sixty gentlemen sat down to the spread. This club was never before in so flourishing a condition as now, having on its rolls the names of 215 gentlemen, many of whom are engaged in legal practice, and a list of fifty yachts belonging to the active members of the organization. The new club house, at the foot of Eighth street, City Point, is a model of beauty and convenience, and will be the scene of many pleasant gatherings of yachtmen and their friends during the approaching season.

—The "Brewsters"—inner and outer—have recently come into the possession of members of the club by purchase.

CHARLESTOWN YACHT CLUB.—This club held a regular monthly meeting on Wednesday evening, Commodore Pitman presiding. After the business of the evening had been transacted, a collation and social chat was indulged in. Com. J. N. Roberts, accompanied by several members of the South Boston Yacht Club, were present as guests.

BEVERLY YACHT CLUB.—This club held their annual meeting at the Parker House, Boston, on Saturday evening, February 28th, at which the following board of officers were chosen: Commodore, William C. Loring; Vice Commodore, S. S. Gray; Secretary, Walter Burgess; Measurer, H. W. Lamb; Regatta Committee, C. H. Fisher, W. Lloyd Jeffries, W. B. Hodges, E. B. Russell and Walter Burgess.

—Cook, '76; Kennedy, '75, S.S.S.; Brownell, '75, S.S.S.; Wood, '75, S.S.S.; Fowler, '76; and Nixon, '76, S.S.S., constitute the Yale University crew as at present selected

—The members of the South Boston Yacht Club gave a second social, to which their lady friends were invited, at their club house, on Thursday evening last. Dancing, singing, and a collation served under the superintendence of the Commodore, made up the order for the evening.

—The students of Wesleyan University, at Middletown, Connecticut, have raised over seven hundred dollars to meet the expenses of their college crew at the coming regatta at Saratoga.

DARTMOUTH COLLEGE, HANOVER, N. H., }
February 27, 1874. }

EDITOR FOREST AND STREAM:—

A meeting of the Dartmouth Boat Club was held to-day. The object was mainly to listen to the report of the delegates who attended the Association Colleges at Hartford. They were sent without instructions and consequently acted in accordance with their own judgments. Upon the question where the Intercollegiate Regatta should be held, they voted with the minority against holding it at Saratoga, but as a majority of that Convention were in favor of that place, Dartmouth does not intend to withdraw from its decision. Everything considered, Saratoga seems to be the only really suitable place. New London was mentioned, but that being tide water, would work seriously to our disadvantage. Mr. Mark Ward was elected to go to Saratoga to make arrangements for our crew. We are not able to speak definitely as to whether there will be a Freshman crew or not. It is to be hoped that that class will decide to send one.

In regard to the moral effect of Saratoga upon the students who assemble at the races, it seems to us that its influence will depend entirely upon the character of each person who goes there. So that objections made to this place, could be made with equal force to any other. As far as the matter of expense is concerned, it would be much cheaper for Dartmouth to send a crew to Saratoga than to Springfield, as we did last year. At any rate, the experiences of this season will do more to decide upon the merits of the new place for holding the regatta than many mere theories.

RUFUS.

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, trails, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.]

WANDERER.—Will answer next week more satisfactorily than now.

CERVIX.—Do elk shed their horns as regular as deer? Ans. They do. The whole family of the Cervidae follow the same rule.

FAIR PLAY, New York.—Of course the man shooting slow birds has every advantage.

S. D., New York.—What is the best dog for hunting rabbits? Ans. A large sized beagle.

C. B. M., Cedar Falls, Iowa.—The price of "Belle," the champion English pointer, is \$1. This includes a photograph and lithograph of the dog.

W. S. S., Boston, Mass.—The rubber inflated bag bird decoys you ask for can be obtained of John Krider, Walnut and Second streets, Philadelphia.

W. M. A., Brooklyn, L. I.—1st. Many of the ponds on the north side of L. I. contain perch and pickerel, accessible by the North Side or Flushing Railways. 2d. Both pictures are the same size.

C. W. R.—Please state in Answers to Correspondents if there is a taxidermist in this city that gives lessons in the art? Ans. J. H. Batty, 245 Broadway.

FRANK BOLLES, Hartford.—You will find full information in regard to the head waters of Connecticut River by reading an article entitled "Winter Camp on the Megalloway" in to-day's issue.

L. D. VAN P., Middlefield Center, Otsego County, N. Y.—Hemlocks can be moved any time from April to 1st June, and have been transplanted even later with perfect success, but would advise moving as above. Choose always a damp day.

MOCCASINS, Pa.—Undoubtedly caribou hide is the best. There is a peculiarity about caribou hide, which is that it does not shrink or stretch when wet, while moose or deer skin stretches considerably when soaked in water.

READER.—What facilities are there in the vicinity of Moosehead Lake for fishing during July? Ans. All facilities which civilization affords. What would probably be the cost of a two weeks' trip there (Boston being the starting point) for a party of three or four? Two hundred dollars for party.

W. R. C., Hartford, Conn.—I have a fine setter, aged 4 years, which has a slight umbilical hernia which is congenital. Will you kindly inform me if there is any danger that any trouble will arise from it, and if so, what I had better do; there has been no trouble yet? Ans. Let nature take her own course.

A. A., Philadelphia.—I have a setter dog which is very much troubled with fleas. Can you give me a receipt for killing them? Ans. Take of soft soap two ounces, carbonate of soda one ounce; mix and add a little water to form a paste; rub this well into the roots of the hair; let it remain an hour, then wash all out with warm water, and dry.

PROPORTION, Philadelphia.—What are the proper proportions of powder and shot to use in the shooting of partridge and rail birds in a breech loader, barrels 22 inches long, about 1/2 half inch gauge? Ans. For rifled grouse shooting at the beginning of the season use 1 1/2 oz. No. 8 shot and 3 drachms powder, at the latter end of the shooting increase the powder 1/4 a drachm and the shot 1/4 of an oz. Rail shooting 1 1/2 oz. No. 8 shot and 3 drachms of powder.

L., Philadelphia.—Where is Pine Brook? How do you get to it from Philadelphia, and is it a good place for snipe? Ans. In Morris County, N. J., it is considered one of the best places. What books can I get to post me on the different breeds of setter dogs, such as Laverack and Gordon? Please let me know them all and what books to send for? Stonehenge, Laverack, Frank Forrester and Richardson.

DR. G., Baltimore.—Will you tell me what brand of gunpowder you consider best, and what No. grain will give strongest shooting with least recoil. Also the proper load for quail or snipe shooting and size of shot. My gun is a 7 1/2-lb. breech-loader, No. 12 gauge. I have been shooting 2 1/2 drachms Dupont's No. 2 powder, and 1 oz. No. 10 shot. Three drachms of powder gives better penetration but unpleasant recoil? Ans. Use a medium coarse powder; it is the electric instantaneous explosion which causes recoil. Use a coarser powder—Hazard. You will get the same penetration with less recoil. For quail, use No. 8 shot. For snipe, No. 10. You don't require penetration for snipe or quail. Increase the shot 1/4 or 1/2 of an oz.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

103 FULTON STREET, NEW YORK,
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, MARCH 5, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

NEW YORK STATE SPORTSMEN'S CONVENTION.

WE have received a visit from Silas M. Allen, Esq., of Oswego, corresponding secretary of the New York State Sportsmen's Convention. The meeting of the sportsmen of the State will be held this year at Oswego. The list of officers of the S. S. C., is the following: Hon. A. C. Matton, President; H. B. Klock, Syracuse, 1st Vice President; H. A. Richmond, Buffalo, 2d Vice President; John B. Sage, Buffalo, Recording Secretary; Silas M. Allen, Oswego, Corresponding Secretary; S. M. Spencer, Rochester, Treasurer.

A novel feature of interest will be introduced for the first time this year which will be of the utmost importance to all field sportsmen. It is the intention of the officers of the New York State Sportsmen's Convention to make the necessary arrangements so as to have an exhibition of dogs used only in the hunting field, such as pointers, setters, fox-hounds, beagles, cockers, &c., and if possible to hold a field trial of such animals as have a local or public record and reputation. The Association propose to offer premiums for the best bred, good looking, and well known performers in the field over game and on "fur." The date of the meeting has not yet been fixed, but will most probably take place in the latter part of May.

The objects of this Association in giving premiums for first class dogs used by sportsmen is to improve the breed and working qualities of the animals, as the dogs used at the present day show very little of the characteristics of their ancestors, and if bred from, as they usually are, add to a race of mongrels which are at the present day countless in the United States. The writer was informed by the oldest sporting editor in the United States that he traveled from Kentucky to New York, stopping at all places of note, and failed to see but five or six dogs which he would call good, staunch looking animals and fair performers in the field. This show of sportsmen's dogs is a corrective step in the right direction, and we trust it will be carried out with energy and spirit, and with experienced gentlemen as judges and referees.

The convention will be held this year under the auspices and supervision of the Leatherstocking Club, of Oswego. The following is the list of officers: President, H. C. Turner; Vice President, M. L. Marshall; Treasurer, N. W. Nutting; Secretary, T. F. Miller. This club has about fifty active members.

FRENCH AQUACULTURE.

RAPPORT PRESENTÉ PAR M. EMILLE CHEVALIER, CONCERNANT LA PÊCHE FLUVIALE.—CONFÉRENCE FAITE AU JARDIN D'ACCLIMATATION, 1873, PAR H. DE LA BLANCHÈRE.

SOME time ago, when noticing a recent report of M. Chevalier, on fish culture, we commented on the fact that it was in France that the first serious movement was made in pisciculture, and that if we were indebted to France and to Coste for the theory, the practical portion of the work seemed to be finding its fullest development in other countries. M. Chevalier, the talented editor of the *Chasse Illustrée*, a gentleman who, from the nature of his office, is peculiarly acquainted with pisciculture, representing the fishery commissioners of the Seine, (we translate his words,) asks this question, "At Paris on the Seine, one of the best fish producing rivers in the world, from Asnières to Port à l'Anglais how many fish preserves do you think you will find? Guess if you can. Only three."

In M. Chevalier's report, which is a most careful and statistical *exposé* of French aquaculture of a year ago, he cites the following facts, that salmon alone are worth to Ireland 7,000,000 francs, to England and Scotland 20,000,000, but that salmon and trout fishing in France do not produce a money equivalent of more than 500,000 francs a year. A curious parallel is drawn between the consumption of game used in France derived from the country itself and fish, France consuming about \$18,000,000 worth of game, of which fully one third is derived from foreign sources. In a very interesting series of tables showing the quantity of fresh water fish used in Paris for the last seven years, it is shown that 1,500,000 kilograms of fresh fish supply all the inhabitants for a year, about one kilogram or two pounds eight ounces and a trifle more per head, whereas in London the supply is sufficient to allow each person to use 50 pounds. Salt water fish come, however, to Paris in much more notable quantity, the proportion being 15,000,000 kilograms of sea fish to 1,500,000 of fresh water fish. M. Chevalier has not far to look for the reasons why fresh water fish are so scarce in France and how with a fresh water area of 210,000 hectares of ponds, and 258,000,000 in lakes and rivers, (the hectare representing 2,471 acres,) she produces so little fish food. This prominent authority states "that piscatorial economy for the last century has been so terribly neglected in France that her rivers are exhausted, her streams are *consumptive*, her brooks sterile, and her lakes and ponds unfruitful. The cause is the general indifference, the happy-go-lucky feeling which predominates, the out-pouring of poisonous substances into the French rivers from the factories, the waste of all natural advantages and tolerated poaching, winked at and sometimes even favored by the authorities themselves. If the Fishery Commissioners of France have," says M. Chevalier, "given certain leases or fishing rights, they grant them for too short a period. Fishermen multiply, fish to their utmost during the brief time allowed them, and depopulate the streams." He purposes that longer leases be given as is done in England where the lessee can economise his fish product, and is careful not to exhaust his hired fishing grounds during the first season. M. Chevalier states that trout are now very rare in France. In 1870 4,607 kilograms presented the total product in trout; in 1871 it was but 2,564 kilos., and this same lessening of quantity is found in all other kinds of fresh water fish; even from want of care and judgment the crayfish are disappearing. M. Chevalier and the Commission he represented proposed that the government should adopt more stringent modifications of the French fishing rules of 1868. We only regret that want of space prevents our giving the more salient points of the changes proposed, believing that from their study our own Commissioners might receive many useful suggestions.

The paper read by M. de la Blanchère before the Paris *Jardin d'Acclimatation* is quite a remarkable one, and its aim is to arouse more particularly the attention of France to the subject of Aquaculture. M. de la Blanchère asserts most positively that if proper care was taken the rivers of France would produce an amount of food represented by 300,000,000 of francs. Before the German conquest, at Huningue in Elsass, the government had a fish breeding establishment, founded as long ago as 1836. Of course, its loss affects somewhat French pisciculture in that section of country, but M. de la Blanchère declares that since it only produced salmon and trout, if other piscifacures were founded their loss would not be felt. The mistake made in France, M. de la Blanchère informs us, was that *attention was paid only to the salmonidae*, and not to other quite as useful kinds of fish. In speaking of this particular family of fish, M. de la Blanchère observes how difficult it is to determine what peculiarity there exists in certain rivers to attract or repel salmon, the temperature of the water being excluded from the question. "No chemical analysis," says our authority, "no matter how delicate it is can discover what is the exact difference between the water of one river and that of another. All we know is that a trout lives perfectly well in one stream and that in the other he is certain to perish." We quote this paragraph, recalling some discussions in the FOREST AND STREAM in regard to salmon in the Hudson, where Heinrich Hudson's statement in regard "to great store of salmon in the (Hudson) river" was doubted. M. de la Blanchère declares that rivers which once were thronged with salmon, owing to the present condition of the waters in France, will not allow salmon to live in them. He states that not over forty years

ago Brittany abounded with salmon. In 1830, at Chateaulin, salmon were caught in quantity; in 1861 only nine salmon were captured. At the beginning of the present century on the Allier the catch of salmon in the season was 5,000; in 1871 only ten were caught. In 1787 fish food was taken in this river alone which would feed 1,500 people; now not even a smolt is seen. In early times the Seigneurial rights protected the rivers, and so they furnished food for the people. A compliment, and a merited one, is paid to the United States, where M. de la Blanchère says, "even in America, where their immense lakes afford feeding ground for myriads of fish of the best kinds, the quantity has diminished so much that in their practical way the Government and the people have set about it at once in order to repopulate their lakes and streams with fish. In the United States useful projects are never allowed to languish, and the impulse given to aquaculture has taken immense strides."

A very interesting fact cited by M. de la Blanchère is in regard to the methods to be employed to assure the presence of salmon, or in fact of any other fish in a river, that is, to be certain to give them the food best adapted to their nourishment. He mentions the case of the Mayenne, where extensive canal works had to be carried on. Of course the quantity of lime and stone thrown into the river destroyed the water plants and minor animal growth, and salmon would not live there. Some one conceived the happy idea of endeavoring to acclimatize the food necessary for the salmon, a kind of *cyprinoids*, and once these fairly established, the fish came back and thrived.

Speaking of the apathy of the French in regard to pisciculture, M. de la Blanchère declares that it arises mainly from the ignorance developed in the lower classes, especially among those living near the rivers, and he asserts that the more educated people are unwilling to make any efforts to enlighten their benighted brethren.

Our authority insists on the necessity of awakening public interest in regard to pisciculture, and he ends by declaring that a law should be passed in France, a trifle arbitrary, perhaps, "that all running water, great or small, whether navigable or not, should belong, from its source to its mouth, to the State," and that when that day should arrive France would, from aquaculture alone, be worth 300,000,000 of francs more than she is to-day.

NEWFOUNDLAND.

ITS INTERIOR AND INTERNAL RESOURCES.

THE island of Newfoundland, whose area is four times that of Belgium, and which contains 13,000 more square miles than Scotland, is to most men quite a *terra incognita*. It is generally known that a peculiar breed of dogs comes from there, and some persons have an indefinite idea of its cod and seal business; otherwise information is very limited, and but dim notions exist as to its geography and natural resources. It seems a remarkable fact that although it was the earliest discovered land in America, and has ever since been the resort of thousands of fishermen, it was only as recently as 1825 that the first roads were made from St. Johns, the capital, to the outlying settlements. We had supposed until now that the universal ignorance that prevailed as to its interior capacities and topography was due to the apathy of its people; that its lack of development arose from lack of enterprise; that the adjacent waters offered such inducements of gain that no one would go inland in search of minerals or for purposes of cultivation. Often have we reasoned that a little Yankee enterprise was all that is needed to fructify the waste places and make the wilderness to bloom and blossom as the rose. Alas! for human vanity and human fallibility! The mystery is all made clear now, and the great problem of the *terra incognita* is solved. The truth is that the interior of Newfoundland is naught but a vast plutonic waste, where no vegetation exists and where no roads can run. Its mineral wealth of copper, nickel, lead, iron and ochres, is great, it is said, and certain to be developed at no distant day; but with the exception of a belt of land four or five miles wide that encircles the island and borders the sea, a belt covered with a fair growth of spruce, pine, juniper, fir, and witch-hazel, all else is desolation and barrenness. No Indians live in the interior, nor is there a house north of Bonavesta Cape, anywhere to be found after one passes a couple of miles inland from the shore. All the land is rocky and rolling, great waves succeeding waves of granite, with bogs and marshes interspersed, which afford a living to reindeer, foxes, wolves, bears, otters, beavers, martins, and musk rats, and form the sources of rivers that flow in all directions. Each one of these rivers abounds in salmon which can be caught with the fly, though it is believed that angler never tossed fly to them, and nearly all these rivers, it seems, are indicated in Hallock's "Fishing Tourist." They are rapid, dashing streams, flowing with impetuous current, up which no boat can push its way; but in their contracted channels the Indians spear large quantities of salmon.

These are about all the facts that can be told of the interior of Newfoundland, and we gather them from no less an authority than Michael Carroll, Esq., for fifty years a resident of the country, and the only man who has written a correct account of the interior of the country. It was he who surveyed the route for the overland telegraph wires, and in the course of his explorations traversed the island athwart and across. It is believed that his surveying party is the only one that has ever explored the interior.

Of the other industrial resources of the island there is a more flattering account. Mr. Carroll has furnished w-

with the following statistics:—The population of Newfoundland is 175,000, out of which number 35,000 are fishermen. The average catch of fish each year is 1,250,000 quintals (112 pounds to the quintal), and the yield of cod oil three quarters of an imperial gallon for each quintal. The French send out 12,000 fishermen every spring to prosecute cod fishing on the banks of Newfoundland. All the fishing vessels arrive at St. Peters before commencing the fishing trips. The resident population of St. Peters is about 3,000. The French fishermen return, after their fishing voyage, to France about the 1st of October. The French also prosecute their cod fishing on the north and west parts of the island from Cape John to Cape Ray. No French are allowed to reside on that part of the island of Newfoundland known as the French shore. This spring of 1874 twenty-five large steamships and 214 sailing vessels intend prosecuting the seal fishing business, and their crews will number no less than 12,000 men. The average catch will be about 550,000 old and young seals, and the value of the seal oil and skins may be estimated at £600,000. The voyage for sailing vessels commences about the 5th of this month, steamships starting some five days later. Messrs. John Munn & Co., Harbor Grace, send out the largest fleet, and have the credit of manufacturing the purest seal oil in the country.

Mr. Carroll is the author of a most practical and comprehensive treatise on the seal fishery, which contains many facts unknown to naturalists, a notice of which we trust shortly to present to our readers.

MEN WITH TAILS.

Fully thirty years ago, before Mr. Darwin had completed his theory of evolution and development, there came to Europe the story of a race of negroes, called Niam-Niams, who rejoiced in caudal appendages. Certain ludicrous facts were added to the descriptions of these people, who unable to sit down on account of their tails, were in the habit of carrying with them stools with small holes cut in them, through which the prolongation of their spines might pass. As the sources from whence the information was derived were of doubtful character, though sometimes advanced by the supporters of the Darwinian theory, anthropologists were inclined to ridicule the story. We are by no means prepared to state whether, when such cases are found, such as of human beings having tails, it should be considered as indicative of a peculiar race, or to be due to an incidental cause or freak of nature, or whether it is a return to some old natural type. When, however, such caudal individuals are seen, since even their accidental presence is doubted, it is well worth recording. The interesting facts which follow in regard to two human beings, furnished us by our most trustworthy contributor, "Piseco," we must accept as the most positive proof that individuals are found having prolongations of the spinal column, for his evidence is beyond cavil, and supported by truthful witnesses. We quote our correspondent:

WASHINGTON, D. C.

EDITOR FOREST AND STREAM:—

At the risk of injuring my reputation for veracity, I propose to furnish the FOREST AND STREAM with an account which, however strange, is actually true, of some people I have met with.

Fortunately I have among my friends, and you have among your readers, some of the most learned men in the land, who are at the same time—possibly because they are so learned—firm believers in, and supporters of the Darwinian theory of evolution and development, and I trust to them to come to my rescue with argument, if my facts seem a little too strong. Briefly, I have in my knocking about the world, met two persons with tails.

One of said tails I saw distinctly, the other, as distinctly, I did not. The one I saw was in Africa. A party of four of us started early one bright forenoon to drive from Widdow's Hotel in Cape Town, to a sunny little English town at Wynberg, where we proposed to enjoy an out-of-door dinner and return in the evening. About three or four miles from Cape Town we passed—as we had several others—a little collection of Hottentot huts, located under a cocoanut grove on the left side of the road. A number of little children, all naked, were playing between the road and the huts, and as we approached and passed, scuttled off rapidly for the huts. One little fellow—boy or girl I don't know which—about six or eight years of age, was not twenty feet from us, running, and we saw plainly that it had a prolongation of the spinal column, about two or three inches in length. This prolongation was pointed, something in size and shape like a very taper finger and pointed nearly straight down.

We were driving four-in-hand and at a gallop, and shot by rapidly. I shouted to the driver to stop, but we had got so far by, that the proposition was voted down, and to my regret ever since we did not stop to investigate. One other than myself saw what I saw, the others did not.

In the other case, I was the guest of Mr. John Mitchell, a prominent resident of Pulo Penang, an island in the Straits of Malacca. A servant of the family was a woman of perhaps forty years of age, called Mary Andaman. She was a native of the Andaman Islands, and had been brought to Penang when but a little child. At that time Mary had a penchant for doing without clothing, and it was a well known fact that she had so much of a prolongation of the spinal column that it was popularly said that she had a tail.

I heard of this from several and asked Mr. Mitchell about it. He said that it was true, but said that it was a subject seldom spoken of; that the woman, who was a respectable woman and member of the church, was very sensitive in regard to the matter, and for years had refused to submit to any examination, and was annoyed and angered by reference to it. I saw the woman, and I have perfect confidence in Mr. Mitchell.

PISECO.

—In a three-ball carom game of billiards at Tammany Hall on Wednesday night, between Daly and Dion, Daly made the unprecedented run of 212 points in one inning. The game was 600 points, for \$1,000 a side, on a Collender table. Daly won. In the 66th inning, Dion was 547 to Daly's 591, when Daly went out in the next inning. Daly's best runs were 91, 43, 212; Dion's, 26, 65, 39, 81; winner's average, 9; time of game, four hours and ten minutes.

—The "Duchess of Geneva," the famous \$40,000 cow, died at the farm of Hon. Samuel Campbell, at New York Mills, on Friday.

THE INTERNATIONAL MATCH—QUESTION OF MEN AND ARMS.

NOW that the challenge from the Irish eight to American riflemen has taken definite shape (see details in another portion of the paper), it devolves upon our leading gun manufacturers to see that the experts in whose hands their arms are placed, who are to represent America in the contest, shall lack nothing which mechanical or scientific skill can furnish, so that their representatives shall find themselves possessed of such arms as to place them on a perfect equality with their foreign competitors.

From present appearances, the contest will go further than the mere trial of personal skill between expert riflemen of different nationalities. It must resolve itself into an absolute trial, which must decide at least for a while the merits of muzzle and breech loading rifles. It is the Remington, the Sharpe, the Ward-Burton, or any other rifle, all breech loaders, against the very excellent Irish Rigby muzzle loader. Our best shots at Creedmoor are yet divided upon the relative merits of their arms, as they all present certain points of excellence. It is quite evident from the scores published by us that our breech loaders are quite equal to the best muzzle loaders at short ranges, and that they already approach very closely the performance of the latter, even at long ranges, taking into consideration the very short practice our own men have had at distances of eight hundred yards and upwards. As far as our military arms have been tested as target rifles, they have been found to be quite as good as the best muzzle loaders, but no better opportunity will ever be afforded to settle this question than the coming match, which will, in addition to its national character, tend very much to settle, at least as far as public opinion goes, which is the best of our own peculiar systems.

The Messrs. Remingtons, the Sharpes Manufacturing Company, and Mr. Ward Burton, or whatever leading rifle makers may bring their weapons into the contest, must bestir themselves. The existing sights on our rifles will not bear a comparison with those used on the Rigby or Medford arms. No matter how admirable may be the other mechanical details of our arm, the want of a carefully constructed sight must put our most skilled men to a disadvantage. We have every reason to believe that all our celebrated rifle manufacturers will have ready very shortly carefully made sights. This is, however, not even yet entirely sufficient. While in England the mild winter and the long twilight allow practice much longer than with us, giving their riflemen time to adjust their sights and to rectify the slightest errors, we in the United States have a much more limited period for rifle exercise. Our own arm makers should, just as soon as the opportunity presents itself, take their rifles in hand and experiment with them. Our American sights should be divided with uniform scales, presenting minutes and seconds, or subdivisions of an inch, the former being preferable as affording a means of comparison with the table of elevations, and with allowances made for wind at different ranges, as found in the various standard works on rifle practice. From this scale a table should be made, deduced from actual experiment by an expert, which would give the exact elevations required at different ranges, with barrels of a given length, and with certain calibres, or with specific charges; also the allowances to be made for differences in temperature or effects caused by cloudy or clear weather, or by the wind, all of which should be furnished to each rifleman. If this is done, the practice of our riflemen resolves itself into the study of the idiosyncracies of their particular rifles, for every rifle shoots a little differently, and as we have no time to spare, if our rifle makers would work out these points for us, such as the English and Irish rifle manufacturers have done, we should save much work and be much more certain of success. Measures of this character would give, too, to our riflemen who may enter into this international contest a chance of making comparisons. How often it happens at Creedmoor that A hits a centre while B makes but an outer. B then asks A where he has his sight to? and receives this reply from A:—"About an eighth of an inch from the top." This, in delicate long range shooting, gives no assistance at all, as who can judge exactly what "about an eighth of an inch" really is. Very probably, however, B fires again, having changed his sight to about the eighth of an inch, and never gets on the target at all.

We believe that if what we suggest to our rifle manufacturers is carried out, that carefully constructed sights be made for their arms, sights which allow the slightest variations to be recorded, and these rifles be thoroughly tested by the manufacturers at long range, and then given to our men for use, if defeated we are we will be beaten but by very little. If we examine the best scores published in the last report of the English National Rifle Association, they will be found to be really no better than those of our own Amateur Club. All that is required is a good weapon and a good amount of practice. As the match will take place in September there is plenty of time for us to get to work.

We sing then, truly, "*arma virumque*." The experts we have, but who has the best rifle? Who will send a rifle fully equal to the Rigby as to carefully constructed sights? In the construction of our breech loading barrels, their mechanism, and the projectiles themselves, nothing is wanting. The gist of the whole matter lies with the sights and the adjustments. Get these sights, then, up to what is perfectly possible as to accuracy, and when September comes perhaps our Irish friends may find a stubborn foe.

—Honest ducks dip their heads under water to liquidate their little bills.

PROFESSOR BAIRD'S PANTHER FEAST.

WE have a taxidermist friend of not only an inquisitive but most daring frame of mind. Some years ago we received a letter from him, which was as follows: "Pray dine with me. Such a lucky chance. The menagerie has burnt up. You have long wanted to taste tiger, now is your chance. I have even a bit of lion flank; and a rib of giraffe. Yes, sir, and an elephant foot! Dinner at six, sharp." We came and dined. The tiger was fearful, fearful, the lion was disgusting, the camel-leopard was passible, but the elephant was delicious. We picked the bones, and wanted to put the strange articulations in our pocket, but this our amphytrion sternly forbade. "You can eat all you want," he said, "but must take nothing away in your pocket." Professor Baird, it seems, has been giving his friends a panther dinner, and the *Tribune* correspondent gives an amusing account of it, and how the learned Professor proposes "to propagate panthers, so that every family in Washington might keep a few, or as many as he wanted." "*De gustibus non disputandum*," and though Mr. Batty tells us that gizzly "is just as nice a thing as you can eat," and a travelled friend assures us "that a milk-fed puppy, in the celestial country or even among the Crees, is nice," still for the present and for the future, having had quite a nauseating experience as to the flavor and savor of strange animals, we shall remain contented with the more common and hum-drum beef, mutton and turkey. Though we can eat crow, we don't hanker after it.

"POL SMITH," OF ST. REGIS.—A correspondent at Malone, New York, encloses us some leaves from a copy of Dickens "All the Year Round," for 1860, which contains an interesting article on the then primitive hunting grounds of the Adirondack region, in which the now famous and popular landlord of St. Regis appears in the role of guide, cook, etc. It refers kindly to his initial efforts in keeping a hotel, the many trials and difficulties which he met and overcome, the funny experiences of the writer in company with "mine host," and gives most truthful pen portraits of localities and persons whose names have since become household words. We should be glad to reproduce the entire article, and would do so but for lack of space and the fact that it would be but a repetition of oft-told descriptions which all know by heart, either from their own or others' experience. We print merely that introductory portion which refers to Paul's early beginning, and this the thousands of guests who have enjoyed his hospitality will read with pleasure, and with the perusal learn to respect their genial and indomitable host the more. We quote:—

Apollos Smith was our guide on my first tramp among the Adirondack Mountains in New York. He is a famous fellow, Pollos, or Paul, as he is called. A tall athletic Yankee, with no superfluous flesh about him, raw-boned, with a good-natured twinkle in his blue eye, brimful of genuine Yankee humour; he has no bad habits, and is, withal, the best rifle-shot, paddler, and compounder of forest stews in the whole region. Let me tell his last exploit. In Yankee parlance, he was "courting a gal," and in a strait to get married, so he resolved to build him a hotel, and settle. He knew a little lake, or rather pond, on the middle branch of the St. Regis River suited to his purpose. There was a log shanty on it, with two springs close by; it was in a part of the forest little hunted, and abounding in deer and trout, and it communicated directly with the great St. Regis Lake, and other ponds. The winter in those elevated regions is almost Arctic. In the month of January, 1859, he plunged into the forest with two lumbermen, took possession of the shanty, and began his clearing. The snow was five or six feet deep, and the cold intense. They felled the gigantic trees, pines, hemlocks, firs, and cedars, cut out beams, split shingles, and laid the foundation of a large house on the bank of the lake. The boards were sawn at a mill down the river. They cut out a road through the wilderness to the nearest point of a neglected military road, which traverses the St. Regis country from Lake Champlain to the St. Lawrence. During this time Smith, as he has told me, went a courting every Sunday, a trifle of thirty miles, sometimes on snow-shoes. He also went to New York and selected his furniture, besides visiting Boston. The house, a large frame building, was completed and furnished, and Paul was married and settled, before June.

× LARGE ANTLERS.—Last summer, in the large hall of the Rossin House, at Toronto, stood a pair of elk horns of wonderful symmetry and size, but which now decorate one of the elegant private mansions of that city. These measured, in extreme height, four feet nine inches; extreme width, five feet two inches; thickness of horn at the butt near the skull, four and three quarter inches in diameter, and weighed fifty-six pounds! By their bleached and weather-worn appearance, they must have lain exposed to the elements for many years before they were found, so that their original weight was probably much greater, and their length must have been fully five feet. Curiosity led us to enquire their history, and we learned from Mr. Shears, the proprietor of the Rossin, who is one of the most thorough and indefatigable sportsmen in Canada, that in the month of August of last year, while at Prince Arthur's Landing, on the north shore of Lake Superior, he came upon a group of Indians with these antlers in their possession, which they offered for sale. This single fact of their being valued by the Indians as a curiosity, indicated that the size was remarkable, and so the antlers were purchased, (for a mere song,) and transferred to the grand hall of the "Rossin House," where they were admired, wondered at, and commented upon, and the general opinion seemed to coincide with that of a long lean Yankee, who said: "I guess them ere horns be as big as they git!" The Indians said they found the antlers early in the spring in the "Big Woods," far to the north of Lake Superior.

ANGLING LITERATURE.—The receipt of the following letter is quite grateful to us, for though not inclined to blow our own trumpet, it is doubly pleasant for us to learn that the efforts of our correspondents are so fully appreciated:—

EDITOR FOREST AND STREAM:—

We are all enjoying the articles upon "Angling Literature, &c." It is just such articles in due admixture that has kept the "F and S" way up above, and out of the domain of low sporting tastes and made it already welcome reading in our parlors. It is pleasant to know that *we anglers* have a respectable ancestry, and that all along the centuries there have been good fellows like us who could enjoy quiet, gentle, sensible pleasures—the sunny meadows—the dark old woods—and not the least, the wooing and winning the gentle game. The articles are unique, and only possible to one enjoying rare library privileges. There is a peculiar charm in these quaint and homely talks of our old anglers, sometimes commingling their philosophy and their use in rather comical shape. You are certainly giving a real pleasure to many readers who have not a divided but a united taste for books and brooks. MACE VIRTUE.

—We have an avalanche of most valuable news pertaining to yachting, shooting, general pastimes, and various other subjects, coming in upon us just as we are ready to go to press, and which it is utterly impossible to make room for. When the problem can be solved as to how to make a pint hold a quart, we shall be able to provide for the material which presses upon us each week. Either this, or we must enlarge our sheet, which we shall have to do at no distant day.

HIGH PRICED.—The "tit-bit" of partridge which had fed on poisonous berries, eaten by Neilson in Boston recently, cost (the opera people) \$10,000.

DAN MACE.—We fell into an error last week in recording the death of Dan Mace. Mr. Mace, although much emaciated, is alive and improving in health daily. Long may he handle the winning ribbons.

—We are pleased to receive a letter from Mr. O. E. Lombard, of Woodstock, Conn., as we fancied the terrible accident which lately befel him while out shooting would incapacitate our friend from writing.

—We have to thank Major Leech and John Rigby, Esq., for Irish papers, documents, &c.

MEETING OF THE IRISH RIFLE ASSOCIATION—CORRESPONDENCE, ETC.

[From the Dublin Evening Mail, February 13th, 1874.]

The above association held its first meeting of the season on Tuesday at the offices, 110 Grafton street, to transact business of an important nature, the Right Hon. the Lord Mayor, M. P. in the chair.

Major Leech addressed the meeting, and said that the important matter he had to submit for their consideration was the great match between the Irish (now champions of Great Britain) and the American nations. He then read the challenge, in which he (Major Leech) offered to bring a team of Irishmen, armed with Rigby rifles, to compete with the chosen shots of America, armed with American-made rifles, on their own ground.

To this challenge the Americans have responded, and Colonel Wingate, who is Secretary of the National Rifle Association of America, writes to say that they are ready to accept the challenge, provided the 1,100 yards range be given up, leaving the ranges at 800, 900, and 1,000 yards.

A programme of the proposed match was then presented by Major Leech to the meeting, which excited considerable discussion, and at length was finally agreed to, the council waiving the 1,100 yards in deference to the expressed wish of the Americans.

The following resolution was then carried unanimously:—

Resolved, That the council, having read the letter dated 31st October, 1873, addressed to J. Gordon Bennett, Esq., New York, by Arthur B. Leech, Esq., and the accompanying challenge to the riflemen of America from the riflemen of Ireland, represented by the members of the Irish Rifle Association; also letter, dated 20th December, 1873, from George W. Wingate, Esq., Secretary National Rifle Association of America, and Major Leech's reply thereto, dated 16th January, 1874, fully approve of the steps which have been taken to inaugurate an International Rifle Match between Ireland and America, and trust that the arrangements proposed will be carried to a successful termination.

It was then proposed and carried—"That the programme before the council, specifying the terms of the match, be adopted, and that Major Leech be requested to forward the same to the National Rifle Association of America."

Major Leech then read the challenge sent to J. Gordon Bennett, Esq., under date of October 31st, 1873, which was followed by Colonel Wingate's reply of December 20th, 1873, with the acceptance of the terms proposed by Captain Wingate, relative to 1,000 yards instead of 1,100, in a letter written to Major Leech on the 16th of January. (See FOREST AND STREAM, Nos. 16, 21, and 26).

The following letter from Major Leech, with the programme of match, have been sent us by Colonel Wingate for publication:—

OFFICE IRISH RIFLE ASSOCIATION,
DUBLIN, 110 Grafton street.,
February 14th, 1874.

DEAR SIR:—I beg to announce to you that at a meeting of the council of the Irish Rifle Association, held here on Tuesday last, the 10th instant, I submitted a programme of the proposed International Rifle Match between Ireland and America for the consideration of the council, which, I am happy to announce to you, has been agreed upon and adopted by the council in the form which I now have the pleasure to send you in duplicate. You will be pleased to observe that the council, acting on the suggestion contained in your letter of the 20th of December, 1873, have omitted the 1,100 yards range mentioned in my original challenge. With respect to the team, you will also see I reserved the right of limiting it to not less than four men or more than eight. This is unavoidable, as you will no doubt see, because it is impossible at the present time to count with certainty on the exact number of the team which I can bring

with me, or who could take part in the match. I need not dwell upon the variety of possible accidental circumstances that render it impossible for me to name definitely a larger number than four, although I shall endeavor to increase it, and hope that the climate of America, notwithstanding our sea sickness, will enable us to shoot with sufficient precision to make the match interesting. It does not occur to me that I need at present dwell upon any other portion of the programme, which varies so little from the original challenge, save with reference to the period of the year, no other time would suit us. We have our meeting in Dublin in May or June, and at Wimbledon from the 11th of July to the end of that month, and the August game shooting also interferes; thus it is that I suggest any time between the 15th of September and the 15th of October for the match, and would be glad to hear further from you as to the date you would consider best. I also send you several Dublin newspapers, which refer to the proceedings (also published) with evident satisfaction, and whenever you and your friends visit our rifle gatherings here, you may rest assured that no effort on our part will be spared to make the visit agreeable to you all. * * * *

Believe me, dear sir, yours most truly,

ARTHUR B. LEECH.

To GEORGE W. WINGATE, Esq., Secretary National Rifle Association of America.

PROGRAMME.

Programme of the International Rifle Match between the riflemen of the United States of America and the riflemen of Ireland, represented by a team to be chosen from the members of the Irish Rifle Association, to take place in America not sooner than the 15th of September or later than the 15th of October, 1874, on the following terms, viz:—

TEAM—Each team to consist of not more than eight or less than four men, at the option of the Irish, whose decision will be declared on their arrival at New York. The American team to be composed exclusively of riflemen born in the United States. The Irish team to consist of men qualified to shoot in the Irish eight at Wimbledon.

RIFLES—Any, not exceeding ten pounds weight; minimum pull of trigger three pounds. The Americans to shoot with rifles of bona fide American manufacture. The Irish to shoot with rifles manufactured by Messrs. John Rigby & Co., of Dublin.

SIGHTS, AMMUNITIONS, TARGETS, AND MARKING—To be according to printed regulations in force at Wimbledon 1873, as annexed hereto, marked A.

RANGES—Eight hundred yards, nine hundred yards, and one thousand yards.

NUMBER OF SHOTS—Fifteen at each range by each competitor.

PREVIOUS PRACTICE—The Irish team to be allowed the use of the range for practice for at least two days before the match.

POSITION—Any; no artificial rest to be used either for the rifle or person of the shooter.

Mr. Leech, on the part of the Irish team, guarantees to deposit, on his arrival at New York, with the National Rifle Association of America, the sum of one hundred pounds sterling, a like sum to be deposited by the American team, and this sum of £200 to be handed over to the captain for division among the members of the winning team.

Targets, range, and all accessories for carrying out the match to devolve on the Americans. The Americans to choose a referee to act for their team. Mr. Leech will act in the capacity of referee for the Irish team, and the two referees shall mutually select an umpire to whom, in case of difference of opinion, they shall refer, and whose decision shall be final.

The terms of the match to be signed by —, on behalf of the American National Rifle Association, and by Arthur Blennerhasset Leech on behalf of the Irish team.

Duplicate copies of this programme to be exchanged, and all necessary arrangements to be completed on or before the 1st day of June, 1874.

Should either team fail to make an appearance on the day and hour agreed upon for the match, the team then present may claim the championship and stakes.

From Mr. John Rigby, a leading rifleman of the Irish team, we have received a most interesting letter in regard to the prize money system, which we publish:—

No. 24 SUFFOLK ST., DUBLIN, February 12, 1874.

EDITOR FOREST AND STREAM:—

* * * * I commend to your attention the financial statement and the magnitude of the Wimbledon prize list. I regret to have to differ from your journal as to the money prizes. Believe me, they are indispensable to a continuously successful enterprise for prize shooting. My meaning is that a system of medals, cups, or other prizes in kind soon loses the interest of novelty. After a couple of years men will not take the trouble or incur the expense attending rifle shooting. New men may come in, but winners will not care to try again and again to win medals and such things whose possession ceases to interest when they are multiplied. The danger of offering money prizes is chimerical. There is at Wimbledon no gambling or speculation of any objectionable kind, but the expectation of winning enough to pay one's expenses, and the chances of a sum which will enable a man to buy such a prize as he really desires or wants, is a continuous incentive to old men to keep up practice and for new men to come forward. Again, it is a substantial aid to the funds. To illustrate this, see the large sum paid by aspirants for the Queen's prize, the Alexandra, etc., in excess of the amount of prizes. This, however, can only be counted on in matches open to the great body of military competitors, all shooting with the same description of arms, or at least so armed that none have by the choice of arms an advantage over others. The knowledge of this is a first condition for a large entry. Other competitions, called here "Any Rifle Competitions," attract heavier entries, but are of equal value as tending to improve the manufacture of rifles and determine the skill of competitors more exactly than can be done when the error of the shooter and the error of the gun are inextricably mixed up together. The entries in these Any Rifle Competitions are limited, because to be successful entails more expense on the competitor, who must spare no cost to acquire the best arm, also because it is only the minority of men for whom the exact sciences have interest, and the uncertainty which affects the use of the rougher military arms gives to a greater number chances of winning. I feel assured that if properly handled the

National Rifle Association of America has a great future, but it should be sought in the direction of making it the central organizing body of a system of State associations, each in turn the centre of numerous local rifle ranges and clubs. Yours very truly,
J. RIGBY.

As Mr. Rigby, who is a distinguished member of the Irish team, and whom we trust to see in the United States, speaks from a much more extended experience than has been had by any one here, his suggestions are entitled to our fullest consideration. Nevertheless, the better opinion with us seems to be on the other side. When prizes of medals or cups have become a drug with us it is quite possible that money prizes will of necessity be adopted. That day is too far in the future for us yet to cause any anxiety. At present the demand for the modest prizes offered by us, such as badges, medals, and cups, is an eager one, and the disinclination to win money (though all of us care for the almighty dollar) seems quite pronounced. We do not pretend to say that our opinion in regard to ignoring money prizes in all cases is fixed. At an All Comers' match, as suggested by our Canadian correspondent, where men have to come a thousand miles, something may be done in the way of a money prize in order to defray the expenses of the winners. But we are pretty well satisfied that so far the distinction of bearing a medal by the volunteer, won by his skill at Creedmoor, is all that our soldiers care for.

Shot Gun and Rifle.

GAME IN SEASON FOR MARCH.

Snipe, Brant, Ducks and Wild Fowl generally.

FOR FLORIDA.

Red Deer, *Caracus Virginianus*) Wild Turkey, *Meleagris gallopavo*.)
Woodcock, *Philohela minor*.) Quail, *Ortyx Virginianus*.)
Snipe, Plover, Curlew, etc., in great variety.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

—With first of March the Game Season closed, and we are pleased to notice the alacrity with which vendors have complied with the requirements of the law. For the past two weeks the price of game in market has ruled very low, grouse, ducks, venison, &c., being sold at prices anything but remunerative. Quail being scarce were held at the old standard price of \$2.75 per dozen. During the past few weeks the quantity of ruffed grouse sent to our markets was very small compared with the beginning of the season, when they were very abundant, and the stands were bare when the first of March came. Ruffed grouse and prairie hens have sold during the season at an average price of eighty cents per pair; a year ago \$1.00 to \$1.50. As quail are the most desirable of game birds, there is always a steady demand for them, and consequently their market price does not fluctuate like that of grouse. Many dealers cleared out their lofts and storehouses of stale venison and deer skins a week before the 1st, and there has been but little deer meat received in New York for several weeks. For months it has been a drug; dealers, particularly commission merchants, have been much dissatisfied at sales and prices, and have not hesitated to say so. One of the largest remarked that he had "soured on venison," and if others could become equally disgusted, pot hunters' sales would be limited, and such venison as reached our markets would all be sold, instead of a portion of it spoiling for want of purchasers.

—There is absolutely no game left for the sportsman except the snipe and wild fowl that are now beginning their spring migrations to the north. Snipe shooting will be good presently. There will be a few days of good duck shooting, though nearly all the old squaws and coots (scoter, velvet, and surf ducks,) have left our bays, and many broad bills have followed.

Last week the song birds also began to move north in considerable numbers. Large flocks, comprising robins, bluebirds, red-wing blackbirds, and cow buntings were seen passing over Long Island. Our associate, Mr. J. H. Batty, tells us that he saw several young bald eagles in their gay plumage passing northward, and that the greater body of herring and black-backed gulls, have left our coast for their feeding grounds in the north, and many of their favorite sandbars are nearly deserted. In some specimens of the *Larus argentatus*, which he dissected a week ago, some of the eggs were enlarged to the size of a No. 2 shot. Individuals of the same species collected at the same season last year, showed no enlargement of the ovaries. Such sings speak favorably for an early spring.

—Now that spring opens with its promise of the speedy return of the migrating birds, our readers will be pleased to learn of desirable localities for the prosecution of their favorite sport. One of these especially noted for its snipe shooting, is the broad extent of marshes and prairies that lie back of the Wabash River, some ten or twelve miles from Vincennes, in Indiana. Our correspondent "Glano" knows the ground well, and he tells us that snipe are very abundant there in March. There is good hotel accommodation, and one can drive across the prairie in a wagon to the hunting ground, though obliged to make many detours to avoid swamps and sloughs. Several times, our informant says, he was obliged to turn aside from his course to avoid running over prairie hens, which were sitting! What a country for "chickens" this must be! Next fall, when the little ones have grown large and strong of wing, per-

haps our sportsmen will remember these nests that gave them so much inconvenience. This locality is reached by the Ohio & Mississippi railroad.

—The Masculine Pantheon of the Smiths has still a niche or so vacant, so let room be made for a female Smith of this illustrious family, Harriet Augusta Smith by name. Wisconsin is Mrs. Smith's stamping ground, for such a woman must stamp, likewise is Wisconsin the pawing and shuffling ground of the bear. Shall we describe the deed dramatically? A huge bear on one side of the fence, a strong woman on the other. Object of Mrs. Smith to take in the wash, object of the bear, general hugging and pillage. Bear growls at the woman, the woman with her arms a kimbo jeers at the bear. Bear replies, gets the worst of it, then charges in desperation right through the fence at the wash, which comes down with a rush, poles and petticoats, line and stockings in one confused chaos. Ha! the bear has the worst of it, as entangled in the wash cord with one paw in a pair of drawers and his head in an undershirt, he madly endeavors to shake off a night-gown which envelops him. Mrs. Smith naturally loses her temper. A bear in a kitchen-garden is bad enough, but a bear in a weekly family wash is the height of animal ferocity. Quickly she seizes the wash kettle, not only boiling hot but filled with a fluid as strong as concentrated soft-soap can make it, and unerringly Harriet Augusta Smith slings it, pot, contents and all, at the bear. Now Bruin, too, loses that equanimity of mind, for which bears are so noted, and goes for Mrs. Smith. She frails him with a wash pole, as half blinded with the suds in the most ungallant way he endeavors to embrace the relic of the late Smith. But, alas! though not a feeble woman, the wash pole shivers to atoms, and now all the heroine of the Smiths' can do is to prod the bear with a splinter, and viciously she jabs him with it, but the bear minds it no more than a prod with a hair pin. Slowly the bear drives her towards the house, though she gallantly disputes every inch of the ground. Just then Lincoln Greeley Smith, a sweet Wisconsin boy of six, looks out of the window. "Your poor old daddy's gun, Lincoln; git on the settle over the chimney; don't smash the clock, and hand that gun to your mammy through the window; a bar that spiles a lone woman's wash 'aint to have no mercy shown unto him—a mussin' of frills and a chawing uphomespun. Be keerful how you handle that gun, Lincoln, and look smart about it." "Kin I shoot him, mammy?" asked the boy. "I'll lick you worse nor the bar if you don't hand me that 'ere gun at once." The child was brought up in the school of passive obedience, and in the midst of the contest the gun was passed to the child's parent through the broken pane of glass. Without a tremble Harriet Augusta Smith takes that musket, cocks it and places it at the bear's shoulder, just as he reared up to clutch her. There is a stunning report and a wilted bear rolls over in agony on the ground. "Bar skin—three dollars—meat about as much—grease—well there 'aint no putting a value on that if fixed up properly with sweet smelling yarbs. Put that agin my best night gownd and a brand new petticoat. Well, we are about squar." Such was the placid remark our heroine made as Horace pulled the bear's ear and tail, to be sure he was dead. Wisconsin papers ring with the bold deeds of the fair Mrs. Harriet Augusta Smith. Let Mrs. Smith represent her district in the future Wisconsin Legislature.

—A veteran marksman sends us the following useful hints for rifle and gun practice:—

"No person can ever expect to be a good shot with either a rifle or shotgun, without a great deal of careful practice. There are certain muscles, nerves, organs and senses brought into use in target rifle shooting, both at long and short range. For example the flexors of the fore-arm, the deltoid, biceps, triceps &c., these in the arm,—then the trapezins of the back and shoulder and the pectorals of the breast, all these are required to make certain harmonious motions, and nothing but regular and careful practice with a good weapon will make a good marksman. Properly conditioned muscles are just as necessary as good eye sight, both are required to make a good marksman.

To illustrate, let any kind of a mechanic abstain from the practice of his trade, for a few months, and he will soon see that he does not handle his tools as deftly or as accurately as when he is in practice. Indeed it is only by long practice that we accomplish anything. Daily practice then in the open air or in a gallery is requisite. It has been claimed that those who shoot well in the gallery cannot do well in the field; this is a mistake. It must, however, be admitted that in all ranges over one hundred yards, the ground and condition of the mind must be regarded, but otherwise there is no difference between field and gallery shooting."

—A correspondent, J. S. B., calls our attention to a remedy against the dazzling reflection of the sun from snow, water surface, or other objects which frequently incommode the hunter and traveller and often produce in winter what is called snow blindness: This is simply to blacken the sides of the nose with burnt cork. This remedy is not new to us, though not always having corks convenient, (we carry a patent flask,) we have been in the habit of employing damp powder, which answers the purpose equally well, if not better. The philosophy of this is, that the eye receives but one reflection, instead of several.

—Oregon has wisely resolved to protect by law the game remaining in its valleys. For years past it has been the custom to make extensive raids upon the elk, moose and deer to get their skins, the bodies being left on the ground. An act of the Legislature makes it unlawful to kill or offer for sale any deer, moose or elk during the months of February, March, April, May and June, and making it unlawful to take or kill at any time elk or deer for the sole purpose of obtaining their horns and skins.

—In the Massachusetts Legislature an effort is being made to prevent the hunting of rabbits and hares with ferrets under a penalty of \$25, but as far as the practical advantage to be gained by the prohibition is concerned, it is not worth an opinion, for in all our experience with domestic rabbits, (and we have raised hundreds) we have found it more difficult to exterminate the creatures than to propagate them. It were better to legislate for the protection of the ferrets. You can buy five rabbits for one ferret anytime.

—In the Maine Legislature the Committee on Legal Affairs have voted to report a bill prohibiting shooting and hunting upon any island in that State situated within salt waters. Trespassers are to be held liable to owners or lessees of such islands in exemplary damages, to an amount not less than \$20 nor more than \$50, and also to be held liable in the sum of \$5 for each bird shot.

—A nimrod named Alexander Atcherson, of Westminster boasts the slaughter of eight hundred foxes during his life.

—We have again been honored by a number of gentlemen of Olney, Illinois, who have organized a shooting club in that vicinity, and named it "The Forest and Stream Sporting Club."

—We are indebted to the Hon. W. F. Whiteher for the following table of close seasons for Fish and Game in the Dominion of Canada:—

FISH.	ONTARIO.	QUEBEC.
Whitefish.....	19th Nov. to 1st Dec.	19th Nov. to 1st Dec.
" seining.....	30th May to 1st Aug.	31st July to 1st Dec.
Salmon, net fishing.....	1st Aug. to 1st May.	1st Aug. to 1st May.
" fly surface.....		
" fishing.....	1st Sept. to 1st May.	1st Sept. to 1st May.
Speckled trout.....	1st Oct. to 1st May.	1st Oct. to 1st May.
Bass.....		
Pickarel (doree).....	15th April to 1st May.	30th April to 24th of May.
Maskinonge.....		

Fishery laws are administered by Dominion government officers appointed to enforce them in each district where fisheries exist. These officers are vested with magisterial powers, and act summarily. The special prohibitions are supplemented by various prohibitory clauses designed to strengthen protective measures. The Governor in council can adopt regulations to increase efficiency, or relax stringency of statutory enactments, in accord with local circumstances or special necessities.

GAME.	ONTARIO.	QUEBEC.
Deer, Elk, Reindeer or Caribou.....	1st Dec. to 1st Sept.	1st Feb. to 1st Sept.
Moose.....	1st March to 1st Sept.	" "
Hares and Rabbits.....		" "
Turkeys, Grouse, Pheasants or partridges.....	1st Jan. to 1st Sept.	1st March to 1st Sept.
Quail.....	1st Jan. to 1st Oct.	
Woodcock.....	1st Jan. to 1st July.	1st March to 1st Sept.
Snipe.....	1st May to 15th Aug.	
Mallard, grey Duck, bl'k Duck, wood or summer Duck and Teal.....	1st Jan. to 15th Aug.	1st May to 1st Sept.
Wild Swan, wild Goose, Insectivorous Birds beneficial to Agriculture.....	Not to be killed at any time.	1st March to 1st Aug.
Beaver.....	May 1st to 1st Nov.	1st May to 1st Sept.
Muskrat.....	" "	1st May to 21st Oct.
Mink.....	" "	15th April to 15th Oct.
Marten.....	" "	1st April to 1st Nov.
Raccoon.....	" "	
Otter or Fisher.....	" "	1st May to 1st Nov.

Game laws under jurisdiction of provincial governments. No official organization to enforce them. Their provisions are somewhat incongruous, and for want of practical sympathy and machinery such as keep in active and efficient operation the fishery laws, they are disregarded. The provinces being contiguous, their geographical situation admits of and requires some degree of uniformity as to close seasons. Many friends of game preservation desire a uniform date, where practicable in border districts, say 1st September, for commencement of autumn shooting. Also, further prohibition of spring shooting, and summer shooting of woodcock, with rational modifications to suit sectional differences.

—At a late meeting of the Cleveland Sportsmen's Club the following officers were elected for the ensuing year:—

President—Hon. A. T. Brinsmade; Vice President—Harvey H. Brown; Treasurer—W. J. Farrar; Secretary—W. P. Cowan; Board of Directors—G. H. Babcock, W. J. Farrar, H. A. Harvey, Frank Rockefeller, Charles C. Hills.

—The National Sportsmen's Club of Washington, D. C. was organized in April of last year. Its object is the preservation of game and certain kinds of fish, to protect the same by legal means and promote a kindly intercourse and generous emulation among sportsmen. The following are its officers:—President—Col. C. M. Alexander; Vice President—Franklin Rives; Treasurer—Jas. M. Mason; Secretary—M. A. Tappan.

—The Jefferson Sportsmen's Club of Watertown, N. Y. have elected the following gentlemen as officers of the club for the year 1874:—President—Dr. E. L. Sargent; Vice President—Dr. W. R. Trowbridge; Secretary—Chas. R. Skinner; Treasurer—C. Weidner; Chairman of Board of Managers—E. A. Andrews.

—The Bluff City Sporting Club of Memphis, Tennessee, elected the following gentlemen as officers of the club for the year 1874:—President—A. Merriman, Secretary; Jas. Specht, Jr.; Correspondent Secretary—M. E. Smeltzer; Treasurer—I. W. Alley—Active members about fifty.

—The Audubon Shooting Club of Angola, Indiana, elected the following officers:—President—Wm. Chittenden; Vice President—A. D. Parcell; Secretary—F. M. Ardell; Treasurer—Robert Pow. The Board of directors consists of five members and the field sportsmen of the club about thirty active gentlemen.

—The members of the Deer Foot Shooting Club, of South Brooklyn, shot their first pigeon match of the season, on Monday February 23d, 1874, on the Dummy Road above

Greenwood; the contestants shot at 10 birds each 21 yards rise, 80 yards Boundary, 14 ounce shot, H and T Traps, for a handsome silver medal, which was closely contested and won by "Penney;" about one hundred and fifty spectators were present; including Pot Hunters. The following is the summary of the score:—

	Killed.	Missed.
Penney.....	1 1 0 1 1 1 0 0 1	7 3.
King.....	1 1 1 0 0 1 1 1 0 1	7 3.
Hague.....	0 1 0 0 0 1 0 0 1 0	3 7.
Brown.....	1 0 0 0 1 1 1 1 1 0	6 4.
Simpson.....	1 0 1 1 1 0 0 1 1 1	7 3.
Bickerton.....	1 1 1 0 0 1 0 1 1 0	6 4.
Fisher.....	0 1 0 0 0 1 0 0 1 0	3 7.

Messrs. Penney, King, and Simpson having tied, shot at (3) birds each.

	Killed.	Missed.
Penney.....	0 1 0	1 2.
King.....	1 0 0	1 2.
Simpson.....	0 0 0	0.

Messrs. Penney and King having tied the second time, shot at (2) birds each.

	Killed.	Missed.
Penney.....	1 1	2 0.
King.....	0 1	1 1.

Judge, Alexander Macready, S. B. S. C. Referee, John Allport, G. S. B.

—A pigeon match was shot at Dexter Club Grounds last week between Messrs. W. Ireland, W. Schowwer, at fifty birds each, 21 yards rise 80 fall, find and handle for each other, \$250 aside. Mr. Schowwer was out-shot and out-birded from the start, at the 34th bird Mr. Ireland had killed 25, Mr. Schowwer only 14. It being impossible to tie, Mr. Schowwer withdrew, leaving Ireland the victor. The birds were fine flyers, and the day splendid. Messrs. Ireland and Green shoot a match on the 19th of March, fifty birds each, find and handle, for \$200 aside, same grounds.

WASHINGTON, February 26, 1874.

EDITOR FOREST AND STREAM:—

I enclose you the score of a pigeon shoot, which took place yesterday at Kalorama, for a fine breech-loading shot gun; 14 entries, \$10 entrance, 10 birds to be shot at according to the Washington Club rules. The result was a tie, which was shot off at two birds each, resulting in another tie. There being no more birds on the ground, it was agreed to shoot off on Monday, March 2, at Annapolis Island, at 15 birds each.

Ferguson.....	1 1 1 1 1 1 0 0 0 7	Dodge.....	1 0 1 1 1 0 1 1 1 8

J. N. D., Jr.

A LITTLE TURKEY STORY.

FORT SILL, I. T., January 25, 1874.

EDITOR FOREST AND STREAM:—

I was much amused several years ago by reading in the *Galaxy* Miscellany and Advertiser's column some New Hampshire turkey stories, simply huge, and which to cap the climax, wound up as follows: "But these are nothing compared to the latest turkey story from Fort Richardson, Texas, where a company of soldiers returned a few days since from a scout, bringing in three scalps and one hundred and fifty odd turkeys, killed in one night."

Now our *Galaxy* recorder man supposed he had perpetrated a huge joke on Fort Richardson. Allow me take the wind out of his sails a little, and tell a few more turkey stories: The country lying between the Canadian River on the north and the Nenes in Texas on the south, between the 98th and 100th meridians is the wild turkey country *par excellence*. The most of it is in the Indian country, so called, and hunting alone is not healthy. But few sportsmen, other than army officers and those connected with the army have seen and in fact know literally anything of it. As for their numbers and the numbers that are frequently killed in one night—just here tell the *Galaxy* recorder man to open his eyes—it would astonish anybody but the natives. I have seen hundreds at one time feeding on the prairies; in the evening they collect from near and far in some bottom land with large cottonwood trees and go to roost, sometimes a hundred or more within a space of a couple of hundred yards. I can now recall to mind several instances of hunting parties from forts to get Thanksgiving or Christmas turkeys that have returned loaded as follows: One party of twelve men had 156 turkeys; a party of officers had 60 turkeys and five deer, two wild cats and a bear; another party of officers, with a small detail of men, one hundred and thirty odd; three officers this Christmas brought home fifty odd. Our friend Jones, to whom I introduced you in my last letter, shot ten turkeys out of eleven shots. I saw an officer fire six shots this past fall without moving a step, and his servant picked up six turkeys. But where is the use of going on? The *Galaxy* man has long since taken to his legs, and calls me a "whopper" as he runs off.

Now, Mr. Editor, these are all veritable facts, and but few of many within my knowledge. By the way, I have just returned from Red River with a command who were watching for Indians; I sent four men hunting the third night out from this post. As I had turkey breasts broiled for breakfast the following morning, I presumed they had bagged some game. When I marched off in the morning and found twenty-eight turkeys hanging on the wagon bows then I was sure they had. Tell the *Galaxy* man that four men shot those turkeys, and also that they shot them with Springfield breech-loading rifles.

Now it may be, Mr. Editor, that you will take me to task for such turkey slaughter; but let me interpose an objection. These larger kills are only on and for special occasions. Most hunts bring in but a few, just enough to go round, and I have no recollection of an instance in which the birds were wasted. Also, while we have no game laws to guide us, we have sportsmanlike feelings, and you seldom or never hear of a turkey being killed, except in the late fall and winter. Now—in January—it would trouble anybody to kill two turkeys without moving; as Jones remarks, "I tell you, the January turkey cock is a different gentleman from the December fellow." It is now difficult to approach them night or day. Jones has just returned from a few days' hunt; only fourteen turkeys, but three bucks and all caught and held by greyhounds. This little story is enough in itself for another letter, so I will save it for a week.

By the way, your correspondent from Cumberland, Maryland, on the subject of the turkey is in error in one thing, or else his wild turkeys act differently from ours. The cock here does not set on the eggs, nor does the hen remain with him when hatching. She sneaks off on the prairie, makes her nest in high grass, and keeps very shady from her husband. At this season as early as June you will see the gobblers all together in droves, a most disconsolate and sheepish looking lot of grass widowers, and they do not rejoin the females again until October, when the young turkeys are large enough to take care of themselves. With the exception of this his turkeys and our are alike. Yours, BASSO.

REMARKABLE POWER OF MARKING BIRDS.

WASHINGTON, D. C., February 28, 1874.

EDITOR FOREST AND STREAM:—

Last fall, while rail shooting on the Magazine Flats, my pusher convinced me of the truth of his reputation that he could mark a bird keener than a dog. After several to me extraordinary finds among the wild oats, two birds (reed birds) got up and I killed one with each barrel, they falling forty or fifty yards apart. Bailey undertook to push for the first and nearest, and I to keep my eye on the spot where the second fell. He got his bird all right and then, he not having looked in the direction since his first glance, I undertook to pilot to the second. When satisfied that it was lost bird—"eels had got it"—Bailey laughingly pushed a few yards to right and ahead, and picked up the bird as though he had seen it from the first moment.

With regard to the rail found on the Potomac marshes, there is a rail considerably larger than the rest, called the king rail, and another of the same size as the king rail, differing only that on the wing joint there is a horny prong with a claw, which will hardly be noticed but by a close observer.

PISCO.

NEW CRAIG, MONMOUTH CO., February 20, 1874.

EDITOR FOREST AND STREAM:—

My brother sportsman "Camden" wishes me to give you the reason I used No. 10 shot last season, when I made the "good shots," a description of which you were pleased to notice in your issue of last week. It will give me pleasure to do so, and will I be happy to hear from him or others in reference to their experience in such matters. I will be permitted to say just here I do not wish to convey the impression that these shots are a common occurrence with me. By no means, but the contrary, many of my double shots are not very brilliant or successful. Last summer I obtained the gun in question of my friend H. W. Abbott, Esq. of New Brunswick, whose long, practical and successful sporting career gives his judgment in such matters much influence with me. With the gun I received a number of cartridges, loaded with No. 10 shot, and instructions to load others just as they were loaded for the early part of the season. This was my first experience with this kind of a gun, and anticipating fine sport I purchased two bags of shot (30 pounds) of No. 10 shot for the approaching fall season. I loaded a large number of shells with these shot, and not having much shooting they lasted me the entire season, not only in this State, but in Delaware and Virginia, where I made one of the shots alluded to. Like "Camden," I had never used for quail shooting this size shot before, always using No. 8, and thought there must be something wrong about it; but after my experience the past season I am inclined to try them again, at least in the early part of the season. Mr. Abbott is an advocate of a greater number of pellets of a smaller size, as your chances of killing are thereby increased with a thicker and more even delivery of the charge and greater penetration and not mutilation of the game as at short range, which often occurs with larger shot, especially when small game is young and tame. I don't know that I can give a satisfactory or more scientific explanation to the matter than this, but will give you the actual result of one day's shooting in Delaware the 12th of last January with this shot and gun, and will leave your correspondent to form his own conclusions. Here you have it, late in the season at that: I made a bag of twenty quail, and when I missed, which was quite often, I am satisfied it was not the fault of the shot so much as my inaccuracy of aim, which I guess is generally the trouble with myself and others. My friend of 120 Eutaw street, Philadelphia, was present when the shot was made in Virginia, and if "Camden" will call upon him he may be able to give more interesting particulars about it and kindred matters, as he is an accomplished sportsman.

"MONMOUTH."

Sea and River Fishing.

FISH IN SEASON IN MARCH.

Speckled Trout. Land-locked salmon. Exception is made in the State of Pennsylvania, where the close season does not end until April. In New York, the season begins on the 15th of March and in Massachusetts on the 20th March.

Pompano.	Trout, (Black Bass.)	Sheepshead
Snapper.	Drum, (two species.)	Tailorfish.
Grouper.	Kingfish.	Sea Bass.
Rockfish.	Striped Bass.	

—Our regular Boston correspondent says that a splendid salmon, one of the first of the season from the Penobscot River, weighing twenty-two pounds, was on exhibition at the stall of Wm. Prior, Jr. & Co's., 127 & 129 Fanueil Hall Market, Boston, Wednesday, February 25th. It was a plump, fine-looking fish, well marked, and when seen by the writer, was being admired by a well-known angler and artist who has made the salmon a study, and successfully reproduced them on canvas.

—A Calais, (Maine,) paper publishes some interesting facts relative to the Passamaquoddy Indians. These number some 471 souls, and are located in two villages, one at Pleasant Point, and the other near Princeton, on a point of land projecting into the third of the chain of Schoodic Lakes, and known as Peter Danna's Point. It is from the village last named that guides, canoes, etc., are obtained by anglers for their trips to Grand Lake Stream and the Schoodics, and those who may contemplate a visit there this spring will be gratified to learn that these Indians are noted for their temperance and sobriety, there being but four of the number who occasionally get drunk. The females are remarkable for their chastity, there not having been an illegitimate birth among them for twenty years. Many of the Indians can read and write, and the tribe have a representative in the Maine Legislature.

—The Seaside Press, of Sandwich, Mass., says that Prof Vinal N. Edwards, of Woods Hole, who is collecting specimens for the Smithsonian Institution, and National Museum, Washington, D. C., has the last year collected the following fish and sent to Washington in ice, (consisting of seventy-five different varieties.) Small spotted skate, peaked nose skate, sand shark, blue shark, leopard shark, makerel shark, trasher shark, hammer head shark, sleeper shark, (never before found in these waters;) horned dog fish, no horned dog fish, common mackerel, spotted mackerel, tallow mackerel, mackerel scare, white mackerel, (not before found here;) sea herring, English herring, brown sea robin, large red sea robin, long finned sea robin, flying fish, tautog, scup, sea bass, menhaden, shad, hickory shad, common butter fish, square headed butter fish, (or silver fish;) common eel, lamper eel, striped bass, squiteague, squid, king fish, tom cod, sea perch, sculpin, common large

flounder, four spotted flounder, small mouth flat fish, large mouth flat fish, (very rare;) talbut, pollock, smelt, toad fish, swell fish, blue fish, haddock, hake, sturgeon, goose fish, boneta, sucker, cramp fish, red sculpin, (or pork in barrel;) large black stingray, bill fish, (seven feet long;) pilot fish, rudder fish, horned swell fish, (or egg fish;) puffin pig, file fish, moon fish, pompano, cero, spanish mackerel, cunner, leather jacket, (never before caught in these waters;) cod fish, whiting, (or frost fish;) mullet, ling, and three other fish that he does not know the name of."

—We are very anxious to serve the interests of a Mr. Frederick Senieur, of Mount Sterling, Ky., who has applied for "a New and Improved Mode of Holding and Supporting Fishing Poles while Fishing," the nature of which invention "consists in providing a substantial support for the pole, thereby preventing the same from being stuck in the mud or held in the hand."

No one can fail to appreciate the ingenuity of this labor-saving contrivance. All that is required to make the angler's outfit complete is an alarm bell attachment to the reel to sound the instant a fish strikes, so that the fisherman, seeking rest and recreation, may be able to take his quiet nap between times. We recommend this patent for all descriptions of fly fishing.

—In the Maine Legislature the committee on fisheries have voted to report a resolve calling for \$5,000 to be expended by the Fish Commissioners for the propagation of fish.

—We publish below the estimate of the products of the fisheries of the District of Gloucester for 1873, as prepared at the custom house under directions of the Treasury Department:

86,544 bls. mackerel, valued at.....	\$1,125,000
460,600 qtls. codfish, " "	2,070,000
5,000 bls. herring, " "	23,000
25,000 qtls. other fish, " "	50,000
9,000,000 lbs. fresh fish, " "	310,000
275,000 gals. oil, " "	165,000
Shell fish, " "	18,000
7,000 tons fish manure, " "	25,000
Miscellaneous, " "	15,000
	\$3,801,000
Estimated value of fishing products in 1872.....	3,437,000

Increase..... \$364,000
Number of vessels employed, 1873, 385; tonnage, 21,082;
number of men employed as crews, 5,000.

—Dr. James H. Richardson, of Toronto, whose interesting article upon salmon fishing in the River Margaree, Cape Breton, which appeared recently in this journal, has sent us some particulars as regards the illegal and wholesale destruction of fish in that river, which he wishes to bring to the attention of the Canadian officials. He says:

"I ascertained beyond doubt that the law is utterly disregarded. There is not, I believe, an overseer or warden who endeavors to do his duty. Indeed, I was informed that they are as culpable as any other of the inhabitants. Two years ago, a gentleman at the Forks lodged a complaint and the consequence was that his horse's tail was slaven, and one of the wheels of his conveyance stolen, and actually sold back to him before he could leave.

The usual course pursued was to cart a boat to the river, launch it, spear all the pools for miles down, and then having sent the cart down the road to a spot opposite Ethridge's, where it came close to the bank, put the boat upon the cart and go home. The morning after the first spearing I observed, I had occasion to go up the river, and as I passed the house of a justice of the peace, which is situated about half a mile from the river, two miles from Ethridge's, I saw the cart with the boat on still it. I was sure it was the boat I saw the night before, and my suspicions were verified by information subsequently received."

—A member of the Niagara Falls Shooting Club sends us the following account of bass fishing in the Niagara River, which will add a new chapter to the book of knowledge of many of our readers:—

NIAGARA FALLS, February 18, 1873.

EDITOR FOREST AND STREAM:—

With the first breath of spring, we dwellers along Niagara get ready our fishing tackle, and when April showers and April sun have thawed the ice from the creeks, and while yet the river is carrying its burden of ice from the upper to the lower lake, we cast our lines in the creeks for rock bass. Quite gamey, too, are the little fellows, and with a slender pole give quite as much sport as their larger brothers the black bass. In May and June they are taken in the river along its edge in great quantities. Last spring a pleasure party from Buffalo took from my favorite ground one afternoon seven hundred. I also succeeded in three hours in swinging into my boat one hundred and fifty. While yet this sport is at its height, the black bass begins tugging at the line, and from this time until winter sets in, there is as fine sport as one could wish, only one must follow them out as the season advances farther and farther into the river. In July and August they swarm in the channels and on the reefs. A few years ago black bass were a rarity here, but now, thanks to the special law passed for Niagara, they are plenty, and anywhere a fine day's sport is found in the river. The Game Club at Niagara Falls have slightly protected the fish, but if they had fully done their duty, there would be no finer fishing ground in America. A great many of the Buffalo people float from Black Rock along the bars to Navy Island, fishing all the way. A friend of mine, with three others, succeeded in this way in landing forty-four in one trip. It is nothing, only a good forenoon's work for two to capture from twenty to twenty-five. I could take you, Mr. Editor, where to land a black bass would thrill your every nerve with pleasure. I took with me one day last summer an old fisherman, we anchored on a reef where there was not over two feet of water, and the bass were sporting around us on every side, here and there breaking the water, six, seven, eight at a time; the nerves were all excited before we had wet our lines, gradually our reels unwound, and our lines floated out on the swift water. Forty, fifty, sixty feet, and the reels still running, when, "Ah! I have hooked him," came from my companion, and after a struggle of ten minutes he was landed, with the exclamation of, "By Jove that is the first bass I really ever caught. How he did fight! every inch of the way he made a battle ground, and he is a beauty too, full three and one half pounds." We scarcely find them of less weight here in this spot. Now my line tightens, the pole is making a beautiful curve—steady there, my beauty! and out he goes, breaking the water seventy feet below, and rising at least eight feet in the air, the top of the pole is waving like a sapling in a storm, but the reel is slowly drawing him in.

Ah, there he goes again! Another leap for life, but the hook won't slip, it follows him into the air, and I am down in the water. I am quite sure my beauty that your days are numbered. What, again! that was an extraordinary leap, the pole straightens out, and as he goes beneath the water resumes its arch. Now my friend has hooked another, and so the sport goes on. We string eighteen fine fellows and sigh as we look in the pail for bait in vain, which, by the by, is either chub or soft-shell crabs. Not once last summer did I miss a good catch, and each year promises better, so it has been growing. Bass have been caught off the Three Sister Islands in the middle of the rapids, and almost at the foot of the Falls they are plenty. We also have fine perch fishing in the spring and fall, and seven miles below, at Lewiston: we find in the season plenty of herring, and when trolling for bass we are not astonished to find we are struggling with a pike or mascallonge. Come some day next summer, Mr. Editor, and see for yourself what sport we have.

HIRAM E. GRIFFITH.

NEW YORK, February 27, 1874.

EDITOR FOREST AND STREAM:—

Many anglers are glad to learn that the subject of pot fishing and frantic desire for big scores has been taken in hand by so competent a writer as Mr. Whitcher, who as an addition to the undoubted strength of his arguments, has the official power to enforce them in the country under his control.

While he is endeavoring to correct the evil habits of both American and Canadian fishermen, I wish he would devote his attention to the great damage to salmon rivers in Canada, arising from the taking of grilse. In some streams quite a large proportion of the salmon captured by fly are young fish or "grilse" weighing 1½ to 4 or 5 pounds. I am aware that the Canadian fishery laws prohibit the taking of any grilse under three pounds weight; but there should be a provision against killing more grilse than are needed for food. I have heard of 5 to 20 grilse killed daily in some streams, when the fishermen already had plenty in camp, and were obliged to salt down the "take," which after all they probably will give to their canoeemen. It seems a shame to thus kill small fish, which would return to the rivers the next season adult salmon weighing 8 to 15 pounds. Of course no angler can prevent grilse rising to his fly; but with a powerful salmon rod it is a speedy matter to bring the plucky little fellow to the landing net, where he can easily be unhooked and set free quite unharmed.

In the absence of law in the matter, I think discussion on this subject would result in the spread of more correct and sportsmanlike ideas, and thus result in some good.

Cannot you also ventilate some good, rigorous maledictions on the minnow fishermen, who take every trout they can hook—infants, babies, fingerlings, from an inch to a hand long? This piggishness is fairly scooping out our trout streams, leaving no trace of the former speckled beauties. I know some anglers who never take a trout shorter than one's hand.

Do see if you can rub a little decency into the minds of some who call themselves anglers.

FLY ROD.

NEW YORK, February 6, 1874.

EDITOR FOREST AND STREAM:—

If the salmon is as game and as powerful as he is reputed, I would like to know how Mr. Nicholson could kill the number credited to him for one day's work in the score published in this week's FOREST AND STREAM. Twenty-seven salmon averaging fifteen pounds, and five grilse averaging four and a half are set down as one day's catch. A brief calculation shows that a day divided among this number of fish would allow but a few minutes for the killing of each. Mr. Gilmour's day's work on the Godbout, as noticed in your issue of January 15, is not more astonishing, for his forty-six fish weighed but four hundred and twenty-six pounds, an average of only nine and a quarter pounds. It seems to me that either the reports of the fighting qualities of the salmon are greatly exaggerated, or there must be some mistake in these large scores. I should suppose some time must be consumed in casting, preliminary to hooking the fish; some fish must have broken away after running for a while. A fresh fly must have been needed now and then, and probably a new casting line, allowing for which contingencies, you will find that what is left of even a long summer day gives but an exceedingly short time for the killing of each fish. Don't you think it would take longer to kill a striped bass of the same weight, on the same tackle? The point with me is, is the salmon really as game a fish as he is called? and these immense scores seem to prove that he is not. An opinion "as is an opinion" from you will greatly oblige your constant reader, LITTELL.

Rational Pastimes.

Will our University correspondents kindly send us their most recent catalogues.

CRICKET—REVIEW OF THE UNITED ST. LOUIS ELEVEN'S JOURNEY EAST—SUCCESS OF ST. LOUIS MEN.

Although this club made its debut last season only, its name must be familiar to many of the readers of FOREST AND STREAM as that of the club which last September sent forth a team unknown to fame, and unheralded by the tongue of good report, but which in fifteen days travelled 2,691 miles, played seven matches in eleven days, and won five out of the seven, and discomfited the old established clubs of Detroit, Toronto, Boston, and Saint George.

Last season two cricket clubs were organized in St. Louis, ycelpt respectively the St. Louis and the St. George, the latter being under the patronage of the St. George's Society. Towards the close of the season it became apparent to some of the enthusiasts that St. Louis could gather together an eleven which would at any rate make a tolerably fair fight against the old clubs in Canada and the east.

On the 28th of July the St. Louis Club instructed their secretary to communicate to the St. George Club a proposal for the formation of a united club, with the object of combining the strength of the two clubs for the purpose of playing matches with other cities. St. George agreed, and by the middle of August the officers of the united club had been elected, and challenges sent to Chicago, Detroit, Hamilton, Toronto, Boston, New York, and Philadelphia. The officers elected were:—President, Joseph Branch, (also President of St. George's Club and of St. George's Society); Vice President, Harry E. Sharp, (Secretary and Treasurer St. Louis Club); Secretary, Ben. Williams, (Vice President St. George's); Treasurer, Cyrus Day, M. D., (chairman executive committee St. Louis); Council, W. B. Davenport, (Vice President St. Louis); T. M. Caddick, (executive committee St. Louis); and John Tildesley and A. C. Bagshawe of the St. George. The eleven chosen for the forlorn hope were:—

ST. GEORGE'S QUOTA.

Henry Temple, captain, (Rugby); a fine bat, hard hitter, with good defence, but almost useless in the field and sadly crippled at the bat from an affection of the thigh muscles.

H. W. Richardson, (Kent); the best batsman of the eleven; used to play for his county; a good round arm bowler when in trim; had been sick for some time previous to this tour, and having burst a varicose vein was unable to do much in the field.

Tom Dale, (formerly of the Household Brigade); a hard hitter, but with no power of defence; a terror to weak minded bowlers not on the spot; three years ago made his century in London in Household Brigade vs. Civil Service; a fair bowler and a good field.

T. L. Mordaunt, (late of Her Majesty's Twenty-third Foot); a steady bowler, with a peculiar "high and home easy" delivery, often with a break from the off; proved very effective on the tour; a magnificent field.

ST. LOUIS' QUOTA.

Cyrus Day, M. D., (Guy's Hospital); a steady bat and a good field.

J. W. Jeffries, wicker keeper, and always willing.

H. E. Sharpe, (Sandhurst); a barn door style of bat, difficult to get rid of; vexatious to bowl at; active field; change bowler; medium round arm.

C. West; left handed; out of practice; has the making of a good batsman in him; good field.

E. H. Lycett, (Merion); young and active change bowler.

C. J. Spencer, (Yorkshire); a good all round man, but terribly rusty.

W. W. Eisenbrey, (Young America); long stop.

R. B. Grant, (of Little Britain, I. T.); umpire.

Their favorite bowler, T. Webb, at the last moment found himself unable to leave his desk. With a low, swift, shooting delivery, he is a good ally and an uncompromising opponent. His loss was felt often in the field, as the team was weak in bowling.

On the night of August 31st the eleven left St. Louis, and the next day, Monday, September 1st, gave battle to Chicago with the following result:—

ST. LOUIS.		CHICAGO.

Total..... 27	Total..... 53

The Chicago eleven had been gathered together hastily, as no club had existed in that city, except in tradition, for some years. The ground was the best that could be obtained, but no more can be said for it. Very little cricket was shown on either side. Dale made some fine hits, and was given out before wicket.

The Chicagoans were hospitable, and were anxious to keep the United over night, so that they might feast them; but time prevented, and nine A. M. found the *protégés* of St. Louis in a "Pullman," rolling on to Detroit.

At Detroit they arrived at seven A. M., quietly demolished a breakfast, and were in the field at ten o'clock, faced by Bainford and Calvert of Detroit:—

St. Louis won in one inning, with twelve runs to spare. The day was beautiful, the ground in magnificent order, and was the best played game by the eleven on their trip.

The Peninsulars are good cricketers, all young, active, lithesome fellows. Their fielding was remarkably good, but Richardson was fresh, and bowled well, and Mordaunt, as usual, too straight to be trifled with, so that the Detroit score did not rise rapidly, and when St. Louis took the bat Richardson and Temple made the leather fly, and Sharpe provoked the bowlers by refusing to let himself be bowled out. Dayton insisted on making twelve, and Spencer slashed *à la* Gilbert Grace, all of which resulted in a score of 157.

In the second innings of the Peninsulars the St. Louis, fielding was so bad that the Detroiters generously gave them credit for magnanimity in desiring not to beat their opponents too badly. The news went forth that the St. Louis were all *professionals*, and a kind friend telegraphed to the President of the Toronto club—"The St. Louis eleven beat us to-day in one inning; all crack players; look out or they will go through you." And go through them they did, as the sequel will show.

Hampshire, the Peninsular bowler, was *hors du combat*, having broken his leg a short time previously by a fall from a buggy. The following from a Detroit paper gives their view of the case:—"The United St. Louis Cricket Club visited this city yesterday, and had an interview with the Peninsular Club upon the Woodward avenue grounds, the friendly meeting being witnessed by quite a large number of spectators. From the fact that the St. Louis Club had started out to make a tour of all the principal cities in the United States and Canada which boast a cricket club of any pretensions, the cricket admiring portion of this community quite naturally concluded that that organization was a strong playing one, but were wholly unprepared for the rare exhibition of skill they witnessed. The St. Louis Club is made up of professional players; men of muscle and experience gained upon the cricket fields of England, one of them, at least—Corporal Dale—having a wide-spread reputation, having been at one time one of 'All England's (gentlemen's) eleven.' At the bat they rivalled anything ever seen in this city, striking the ball to any part of the enclosure, and in one instance knocking it clear out of the grounds. As fielders, however, they were comparatively weak, some good judges of the game, who watched the match throughout, declaring that they were fairly outfielded by the Peninsular players. The bowling of Mordaunt and Richardson, however, was irresistible, and the wickets of the Detroit club fell with wonderful rapidity, only Calvert in the first, and Edgar and Calvert in the second inning, recording their runs in double figures. In fact, these two young players carried off the honors for the Peninsular Club. Armstrong, Girdlestone, and Morphy, usually good for a large number of runs, making in both innings but five, the two last named drawing blanks in each."

Eight P. M. saw the St. Louis braves once more in a Pullman, swiftly gliding towards Hamilton, somewhat tired, for they had had a hard day's work, having had to field out two innings. Four A. M. was an uncomfortable hour to be forsaking the comforts of a Pullman, and they dragged their weary frames to the Royal Hotel at Hamilton, about a mile from the depot. At eleven o'clock they were on the ground, having filled the interval with soda and B.—

Hamilton won in one inning, with twenty-two runs to spare. St. Louis showed no cricket at all, if we may except some fine hits cut off the ground by Richardson and Dale. The team had been travelling for three successive nights, the previous day had worked hard, and had been turned out of bed that morning at four o'clock. Their condition was apparent from the fact that while their side was in several of them dozed off on the field.

Wednesday night the tired ones slept in Hamilton. Thursday had been laid out as a day of rest. The party broke up into sets; some stayed in Hamilton until evening, some went to Toronto (thirty-nine miles) by the morning train, and some went to the international regatta, which was taking place in Toronto bay at that time.

Friday, 10:30 A. M., found the United on the grounds of the Toronto cricket club, but no Toronto eleven ever yet were on time, so the game did not commence until noon.

The Torontos went first to the wicket. The ground suited Mordaunt exactly, and, as will be seen by the score, he was terrible on this occasion, having secured nine wickets. The Torontos were puzzled by his peculiar style. His delivery is slow and high, and on a hard ground the rise is very rapid. On a soft ground, such as at Boston, New York, and Philadelphia, his bowling is not so effective. Hemsted one of the safest bats of the Torontos, was taken by Mordaunt at the first ball.

In the first innings of the United Stake, the old stand-by of the Torontos, was bowling well, until Dale sent him over the fence, which liberty so shocked his nerves that he was unable to get on the spot again that innings, but in the second one he became desperate and deadly, bowling remarkably straight and with a good pitch. He secured three wickets in the first and seven in the second innings. St. Louis won by forty-three runs:—

Saturday evening the eleven travelled to the "Falls," and spent half of Sunday there. At two P. M. they were once more on the way, *via* the New York Central, and bound for Boston.

Monday, the Boston and Albany train, which should have arrived at 8:30 A. M., was three hours late. Play did not commence until 1:30 P. M., which was unfortunate, as only one day had been laid out for Boston. The United wielded the willow first for seventy-three runs, and got rid of the Hubbites for forty-eight. The United were then put in again, and when time was called had scored sixty-six for the loss of two wickets, Dale having made forty-one and being still in.

The game might have been styled skittles just as appropriately as cricket. The ground was bad, and the St. Louis' property box having "missed connection" the eleven were minus spikes, etc. In the evening the hospitality of the Hubbites was profuse, and but for the sterner virtue of the western men the St. Georges might have gained an easy victory next day.

Tuesday, after another night of travel, the St. Louis men are again in the field, and are beginning to think they have undertaken too much. Nature will have her way at last, foil her as we may for a time. Irregular meals, broken rest, late suppers, and "good times" shake the nerves. Un fortunately for the United team, they had to face the most formidable opponents last.

The following very fair account appeared in one of the city papers:—

Play was called at noon of Tuesday, September 9, with the St. Louis eleven at the bat, they sending in Sharpe and Richardson to the bowling of Jones and Smith, the former sending in his ripping pacers, and the latter a fine length spinning ball. Careful play was the order, and a maiden overs the result for the first half dozen; but in the sixth over Sharpe gave a catch to Smith in the slips off Jones, the first wicket falling for a duck egg. Mordaunt took Sharpe's place, and then run-getting began, but only to a limited extent, as the first four wickets fell for 17 only. When Day and Temple got in together a stand was made, and before they were parted the score had been run up to 44. Afterwards, Lycett joined Temple in scoring well, these two leading the score of the inning, Temple's 19 being marked by three threes and four twos, and Lycett's 15 by a three and five twos. Day was run out for 8 when well in at the bat, Temple being bowled by Cashman, who had gone on in Jones' place, the latter not being as effective as anticipated. Lycett, too, was run out when nicely in and batting well. When the last wicket fell the score stood at 78, of which 13 were extras, nine byes, showing poor long-stopping. Smith bore off the palm in bowling this inning, and he caught out the only man who retired on a catch.

After the usual interval, Cashman and Sleight went to the bat on behalf of St. George against the bowling of Richardson and Mordaunt, the former proving quite effective, but Cashman began to punish Mordaunt from the first over. Sleight was the first victim, the first wicket falling for 9, and Jones followed suit shortly afterward, the second wicket falling for 18, Richardson taking both wickets. Cashman then had Smith for a partner, and before they parted the score had been run up to 29. Moeran came next, and again was a stand made, the fourth wicket not going down until 47 had been scored. Dale then took Richardson's place in bowling, and Moeran soon retired, Lemmon being his successor. By sharp fielding he was run out before scoring to any extent, Satterthwaite succeeding him, and he was the last to make an average score. Cashman's 17 was marked by six twos, and Smith's 11 having a three and a two in it. Satterthwaite got off four hits for two each. Three fine catches marked the splendid fielding of the St. Louis gentlemen, a beauty by Sharpe off Cashman being loudly applauded. The last wicket fell for 67, which left the lead in the hands of the visitors.

On Wednesday the contest was resumed at noon, with Sharpe and Eisenbrey at the bat, and Jones and Moeran handling the ball, a fall which Smith had the previous day having temporarily disabled him. Jones was well on the wickets in this inning, and the result was that the St. Louis eleven were disposed of for 62, Sharpe alone scoring double figures, his finely obtained 24 being the score of the match. It was marked by two threes and five twos. Good catches were made by Eyre, Smith, Talbot, and Cashman, Jones and Cashman taking all the wickets, the former getting seven wickets for 16 runs only. The St. George now went in to get 74 to win, and the task was not considered a difficult one; but to their surprise wicket after wicket went down for small figures, Cashman being the only player to make anything of a stand, the bowling being good and finely supported in the field. Indeed, fielding appears to be the forte of the St. Louis players, and hence the attractive character and success of their play. A splendid leg hit for 6 marked Cashman's 18 in this inning, as also a three and four twos. When the last wicket fell the St. George

total score stood at 104 to 140 by the St. Louis eleven. The latter were congratulated on their well-merited success. Their fine, manly appearance, splendid fielding, and gentlemanly deportment won golden opinions from all present.

Umpires—Messrs. James Smith and R. B. Grant.

Thursday found the United in Philadelphia, "wearyed with service." Little need be said of the play. The United never expected to vanquish the Young America, but they did hope to make a fight stout enough to compel an exhibition of their skill by the champions. Alas, great Hector wearyed fell an easy victim to Achilles. Not only were the United in bad condition, but luck seemed to desert them. In the first inning Sharpe stupidly misjudged a run, and so displaced Richardson, the pride of the eleven, who was well in, and in the second inning Richardson had the misfortune to touch a ball with the shoulder of his bat, which was taken advantage of by Davis. Mordaunt was not in a happy vein, and runs were made off him very fast, so that the captain was compelled to put Sharpe on. Temple and Dale alone distinguished themselves, the former slashing Charley Newhall everywhere, until he was unluckily run out. The bowling of the Young Americas was not as good as the United expected to meet; their fielding, of course, was fine:

Umpires—Samuel Welsh and R. B. Grant.

On Saturday night the United left Philadelphia for home, where they were received with loud welcome by their friends, and banqueted *à la mode*. Thus ended the tour of the St. Louis United eleven, the first team that has on this continent come up to the cricketer's ideal. They sent unconditional challenges, followed them up, and asked no favors.

In my next I shall give a brief review of the condition of cricket in America, as it appeared last September.

H. R. S.

"WANDERERS."

NEW YORK, February 27, 1874.

EDITOR FOREST AND STREAM:

It is with great pleasure I notice a letter from "Harry E. S.," suggesting the formation of a club of "Wanderers" similar to the "I Zingari" of England, and to consist exclusively of gentlemen strictly amateurs. I think such a club would gain many members in our city. It is very evident that he knows how difficult it is to get a full eleven to leave home. The St. Georges every year take an eleven to Philadelphia, and last year they visited Boston, each member of course paying his own expenses. They were the only club which was able to do so in this city. In Philadelphia, where cricket was supposed to flourish and to be so well supported, they could only send one club on here for one day, so that we in the East can confirm "Harry E. S." in every particular. The great obstacle to getting members to join such a club is the expense and time taken up in travelling. One would have to be a gentleman of leisure indeed to go "wandering" around these United States. However, if a few were to get together and form a club, it would not take many from each city or district to make up an eleven, and I am sure that some of our cricketers, by making their arrangements, could afford time to go off on a tour of this kind.

"H. E. S." suggests that some one in our city should undertake the formation of such a club. I have no doubt that some of them embers of

the St. George of this city would help him and would join the club, but they have too much to do—at least the secretary and officers have to take a very prominent part in organizing a club. However, there are some two months yet to discuss the matter, and the more it is ventilated by the press, the more it will help our noble game. I am, yours very truly,

"PERCY," St. George's C. C., New York.

We shall be pleased to hear from cricketers on this subject.

BASE BALL—AMERICA vs. ENGLAND.

—The following interesting letter is addressed to Charles Vinten, Esq., Treasurer of the St. George's Cricket Club, by Harry Wright, the celebrated cricketer and base ball player:

Boston, February 28, 1874.

CHARLES VINTEN, Esq.:

DEAR SIR—I take pleasure in informing you that the proposed trip of the Boston and Athletic Base Ball Clubs to England this summer bids fair to be a decided success. The project has received the heartiest encouragement, with promises of co-operation from all parties with whom Mr. Spalding has advised on the subject in London.

Our present intention is to start on or about July 18th, playing the first game on "Lord's Ground," London, August 3d and 4th.

We expect to be away from America in all about seven weeks. I beg to thank you and Mr. Gibbs and Mr. Bowman, of the St. George's Cricket Club, for the favors shown me in assisting and furnishing Mr. Spalding with letters of introduction to gentlemen in London, which I hear have been of great service to him. Mr. Fitzgerald has proffered us the use of "Lord's Ground" for our first game at but light expense, which will help materially in paying the expenses of the trip. In regard to Mr. Shaw of Nottingham, it is the Boston Cricket Club that is, or who are, negotiating for his engagement as professional for their club.

If possible, I shall be pleased to arrange with the St. George's for games at Cricket, both in Boston and on your ground, with our eleven. We must learn something more about cricket before starting on our trip, on which occasion I trust to have the pleasure of your company.

I am, sir, very respectfully,

HARRY WRIGHT.

PHILADELPHIA, February 29, 1874.

EDITOR FOREST AND STREAM:

A letter from Mr. Spalding, of the Boston Base Ball Club, now in England, making arrangements for the European trip of the Athletic and Boston Base Ball Clubs, dated February 5, contains the most encouraging accounts of the success of his mission. He had interviewed Mr. Alcock, the cricket editor of the London *Sportsman*, and secretary of the famous Surrey Club, and also Mr. Chambers, the secretary of the noted Athletic Club; and these gentlemen have taken matters in hand to make the coming tour a brilliant success. They have proposed that matches shall be played on the cricket grounds at Canterbury, Brighton, Margate, Birmingham, Manchester, Sheffield, Nottingham, Leeds, Newcastle, Edinburgh, Glasgow, Bristol, and Liverpool, at all of which cities the Americans would certainly meet with a cordial reception. In fact they advise a tour of the three sections of Great Britain finishing at Dublin. Mr. Fitzgerald, the Secretary of the Marylebone Club, (not Fitztem of Philadelphia,) received Mr. Spalding most courteously, and expressed the anxiety the English cricketers feel to have an opportunity to return the kind attentions and the cordial reception they met with in America. He was desirous to have the first game played on Lord's Ground, London. We believe that August 3, which is a bank holiday, has been fixed for the first grand match at American Base Ball ever played in England. It was stated that on the occasion of the appearance of the native Australian team of cricketers at the Oval, in London, the receipts at one shilling admittance amounted to £655, or \$3,275. At latest dates Mr. Spalding was arranging the days for matches to be played, as the dates were now being fixed for the season. So his visit was most timely made, and it has been in every respect successful. The Athletic team will consist of McBride, Pitcher; Clapp, Catcher; Fesler, 1st Base; Battin, 2d Base; McGeary, Short Stop; Sutton, 3d Base; McMullin, Left Field; Gendey, Centre Field; Ansen, Right Field; with Reach, Murnan, and Sausenderfer as substitutes: the nine are all about to begin active training for the season in the private Gymnasium of Mr. Stephen Flannigan.

Sutton has returned from New York State and remarked the other day he intended playing 3d Base better the coming year than he did when he last played the position at Cleveland, where five errors only were charged to him. McGeary has indeed signed with the Athletic Club, and I give it as authority, the New York *Clipper*, to the contrary, notwithstanding, he will not play in Chicago, and the contract is signed and sealed in the possession of the Athletic Club directors.

There is a great deal of opposition on the part of many of the Athletic Base Ball Club to the proposed European trip on the ground of expense and of interference with the regular championship games, but it is probable that the nine will relinquish a third of their salaries during their absence for the sake of going, and thus expense will be reduced; and the regular championship games will be so arranged as to be played closer together that the six weeks or two months absence of the clubs will not be missed.

The choice of conveyance will no doubt be in favor of the Philadelphia European Line of Steamers, and it is hoped they will carry the tourists, as they are the newest and best equipped vessels afloat; and the company will offer a very low price of passage.

A number of the Athletic Base Ball Association will accompany the clubs, and no doubt the party will be made up of forty or fifty of its members, some with their wives; and I will mention Messrs. Ferguson, Warnock, Speering, Huston, Des Granges, and Allen, as having expressed their intention of making the trip. It is proposed that the players of the two clubs shall sail from Philadelphia about July 15, after playing a farewell match together on the Athletic ground, and that the period of their absence shall be eight weeks. This would give them about five weeks for playing in England, during which time all the principal cities could easily be visited. Generally, the two clubs will play against each other exhibition matches, but this programme will be varied by occasional matches with English nines, the latter being given an American pitcher and the advantage of six out to an inning, also by the combination of the American nines in cricket against English cricket clubs. In connection with this matter it may not be out of place to mention that the financial position of the Athletic Club is excellent, all statements in certain quarters to the contrary notwithstanding. It does not owe a cent, has funds in hand, and, under its present capable management, promises to achieve greater prosperity than ever.

"LIPPINCOTT."

—We are requested by the Saratoga Rowing Association to print the following card:

SARATOGA ROWING ASSOCIATION.
It is necessary for the Saratoga Rowing Association to have the address of every amateur rowing club of good standing in the United States and Canada. The Association propose to issue soon its circulars concerning its annual regatta, which will be given some time in August. Therefore it is to be hoped that all rowing clubs will send their address, giving name of President and Secretary, so that none may be overlooked, nor fail to receive circulars. Address

SARATOGA ROWING ASSOCIATION,
Saratoga Springs, New York.

A SMALL-SIZED OMELETTE.—England imported last year 660,000,000 of eggs, costing £2,366,741. Let some arithmetician calculate the weight of the eggs and give us the exact amount of carbonate of lime in the shells.

New Publications.

SMILES' HUGUENOTS AFTER THE REVOCATION. By Samuel Smiles. Author of "The Huguenots; their sentiments, churches and industries in England and Ireland." "Self Help." "Character Life of the Stephenson's," etc. Crown, 8vo. Cloth, \$2 00. Harper & Bros. New York.

This is one of those rare historical books that delight every lover of the true and concise in history. As the reader turns page after page of this revelation of the heroism displayed by this peculiar persecuted people, and carefully examines all the minute details of this thrilling history of sufferings patiently, and often triumphantly endured for conscience' sake, he is led to exclaim "Wonderful people, led apparently by the hand of God!" Notwithstanding the many painful histories and episodes which sometimes threatened to overwhelm this devoted people, yet we lay aside the book with a profounder admiration for their Christian character, as displayed in that sublime faith, that implicit belief in the strength of that Almighty Ruler, "who doeth all things well." In a word, we look upon this work, not only as a reliable history of great interest, but a glowing transcript of one of the most glowing pages of the world's history.

OLD FORT DUQUESNE; or Captain Jack, the Scout. A Historical novel. Pittsburg: People's Monthly Publishing Company. 1873.

In an historical point of view this novel brings to light several new revelations, particularly as regards that disastrous campaign against the French. Although purporting to be only a novel, yet the pleasing romance which gives zest and sparkle to its pages, embues them with an historical value that everyone acquainted with the stirring acts of that eventful campaign will truly appreciate. Braddock's character stands revealed in his every movement, while the unique garrison life at "Old Duquesne" is truly and happily told. In many respects the author has given almost literal history. And while reading this work we can in imagination, not only hear the rattle of the knives and forks around the "mess table," but also listen to the gibes, jokes, stories and songs of the garrison life at Fort Duquesne. The habits and peculiarities of the Indians are exceedingly well drawn, and are worthy a separate volume. The history of Captain Jack, the Indian Hunter, and the love of Waukena were related to me not long since upon the site of the old fort. All these thrilling incidents are fully laid down in this readable work.

"LA FILLE DE MADAME ANGOT" Lanciers (music), which promises to become popular, and a charming waltz from the same Opera Bouffe, in which will be found some excellent melodies skillfully arranged. The "Invincible Gallop," by E. Kate Simmons, author of the well known "El Fresco" waltz, gives additional attraction to the work. Boston: Ditson & Co.

The above house have quite a number of new and original pieces of music, some of which will be hailed with much interest by the public. We shall give short announcements and notices of the same as received.

North American Review. The January number of this exceedingly valuable and reliable Review contains a finely written article on the subject of "Arctic Exploration," from the pen of Isaac I. Hays, whom everyone well knows is amply qualified to do full justice to a subject that has claimed so large a portion of practical experience. Another paper upon the "Antiquities of the American Indians" will at this time commend itself to many of our American readers, as it gives much new light upon the antiquities of this now almost extinct race. "Currency and Finance" is a paper in which, upon a careful perusal, will be found little poetry, but much strong prose, seasoned with much good sense. It would do no harm to many of the frequenters of State street, Boston, or Wall street, New York, should they devote an hour to a careful perusal of the same. We give the *North American Review* a cordial welcome.

Popular Science Monthly. March number. N. Y.: D. Appleton & Co.

The number for March opens with an interesting paper upon the world before the introduction of life. By Prof. Charles H. Hitchcock. Illustrated. In this paper the serial progress of the earth is presented simply as a mass of inorganic, chaotic elements, inert and motionless, representing and embodying the idea of "chaos," as understood at the present day by theologians as the Bible word chaos. The spiral nebula in Canes' Venatica (H. 1622) makes one of the illustrations. To every student of ancient or old world history, this paper opens a new world of thought. This paper alone is worth the price of a whole volume of the work. In this short notice we are able only to call the attention of the reader to one of the grandest, as well as most profound themes of our world's past history, or what has been so long known by the appellation of "our world before life."

Many other papers of much interest to all readers fill up this magazine, among which deserving thought and consideration, we name a paper upon Louis Agassiz—The Future of Alchemy—Modern Optics and Painting—Literary Notes and Miscellany. A very valuable number, full as a nut with meat is this Popular Monthly for March.

The Practical Magazine, Number 1, for January, 1874. Boston: Osgood & Co.

This highly popular work is placed upon our table by the Messrs. Osgood & Co. with the usual promptness of this house, and it gives us pleasure to say that the opening number for January gives full promise of success to the third volume. This number contains a valuable paper upon "Ship-building upon the Clyde," and it gives us some quite new ideas as to the progress and incidents of this vast industry. One who was familiar with the Clyde of years ago would be astonished to know that the original Clyde, a petty, tortuous streamlet, full of rock-beds and shallow fords, &c., should have, by well-directed energy and capital, become one of the grandest highways of commerce. But such it is under the master mind of Mr. Robert Napier. It would give us great pleasure had we the space, to devote much more to this wonderful paper. We can only introduce it to the attention of our readers. The number is otherwise well filled with very valuable papers; a few we name: "Gems of Industrial Art," "Prevention of Railway Accidents," and a large table of Miscellany, both valuable and interesting to the student, manufacturer and general reader.

ANNOUNCEMENTS.

Among the new works soon to appear, is one by Miss Celia Cleveland, niece to Horace, Greeley, who has the reputation of being quite an accomplished writer. This work is entitled "The Story of a Summer; or, Journal Leaves from Chappaqua."

Harper & Bros. have in press and will shortly publish a very valuable work, bearing the title of "Mottey's Life and Death of John of Barneveld," Advocate of Holland, with a view to the primary causes and movements of the "Thirty Year's War." By John Lathrop Mottey, D. C. L., author of the "Rise of the Dutch Republic," "History of the Netherlands," etc. With illustrations. In two vols.

TWELVE MILES FROM A LEMON. By Gail Hamilton. Authoress of "Woman's Worth and Worthlessness," "Little Folks," etc. 12mo. Cloth, \$1 50. New York: Harper & Bros.

CAMEOS. Selected from the works of Walter Savage, London. By E. C. Stedman and T. B. Aldrich. With an introduction. Boston: J. B. Osgood & Co.

ON THE ORIGIN AND METAMORPHOSIS OF INSECTS. By Sir John Lubbock, M. P., F. R. S. Illustrated. New York: Mackmillan & Co. 1874. 108 pp. 8vo. \$1 50.

MEN AND ASSES. An exposition of standard resemblances and differences upon questions of affinity and origin. By St. George Mivart. New York: D. Appleton & Co. 1874. Price \$1 50.

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

Sirs—A friend of mine sent me, with a transport of Indian Skins, two pounds of "Vanity Fair," which I declare to be the best Tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair" is the King of all, by its aromatic flavor and the right sort of strength. My friend in New York got an appointment in California, by that reason I apply immediately to you, begging you to send me for the enclosed ten dollars, a supply of "Vanity Fair," and send with the next steamer to Germany. If there is a German firm that sells your excellent "Vanity Fair," I beg you to enclose me the address.

Sportsmen's Goods.

This arm was submitted in competition with over one hundred different systems, American and European, to the Board of United States Officers, appointed by Act of Congress, 6th June, 1872, for the purpose of selecting the best arm for the service, and of which Brig. Gen. A. H. Terry was President. It successfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for the military service by all nations is only a question of time; that whenever an arm shall be devised which shall be as effective as a single breech-loader, as the best of the existing breech-loading arms, and shall at the same time possess a safe and easily manipulated magazine, every consideration of public policy will require its adoption."

Resolved, further, That the experiments before the Board with the Ward-Burton Magazine System have so impressed the Board with the merits of this gun, that they consider it as more nearly fulfilling the conditions above specified than any other tried by them or of which they have any knowledge, and it does recommend that a number of magazine muskets be made on the plan for further trial in the field." (See Ordnance Report.)

We are now making these guns to supply the numerous demands, and will soon have them in the market.

The following is our scale of prices: Special Magazine for large game, carrying from 3 to 8 cartridges, 70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10 lbs. weight, from \$60 and upwards, according to finish. Special Long-range Magazine Rifle for Creedmoor shooting, 90 grs. of powder, 480 grs. of lead, carrying 3 to 8 cartridges, weighing 10 lbs., from \$100 and upward. Magazine guns for general use, carrying 3 to 9 cartridges, 60 grs. powder, 350 grs. lead from \$40 and upward. Single Breech-Loader, Creedmoor shooting, for long range, 90 grs. powder, 480 grs. lead, from \$60 and upward. Single Breech-Loader for general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead, from \$30 and upward. The calibre of all our rifles, unless otherwise ordered, will be 45-100 in.

SPRING.

For Forest and Stream

O H, have you seen my wayward love
Come tripping up the valley?
Once more the silver streamlets flow,
Why doth the maiden dally?
She cometh from the sun-kiss'd lands,
Sweet buds and blossoms bearing,
And all along her balmy way,
The happy birds are pairing.

Methought I spied her from afar,
When southern winds were blowing,
A misty veil was o'er her thrown,
And robe all graceful flowing.
I listened, and I seemed to hear
The signal of her coming.
Where emerald tipped, the willows waved,
And sluggard bees were humming.

The fleeting sunbeams hid away
Among her golden tresses;
Her little feet stepped daintily,
Among the water cresses.
She loitered by the roadside rill,
Where mossy rocks were looming,
She whispered to the violets,
And set them all a blooming.

With eager hope I keep the tryst,
And wait the wayward rover,
Till grown less coy, the charming maid
Shall haste to greet her lover.
But hark! the twittering swallows tell
She will not longer dally;
With blushing cheek and joyful tears,
She meets me in the valley.

F. W. A.

sail; the sails are altogether inboard, and I have found the rig extremely simple and convenient. I generally use about 2 cwt. of lead ballast, and sometimes about 80 lbs. water ballast in addition when out sailing by myself in a strong breeze.

Altogether, I think the "Minnie" a success. She sails very well for her size, pulls easily either with sculls or oars, and is a good sea boat. She is so honestly and faithfully built that though she has been sent about by trains, steamship, and cart, beached and exposed to a scorching sun, yet she is as staunch and tight now as when she left the builder's yard. I had occasion to go to Quebec last spring, 1873, and before going designed an expedition down the St. Lawrence. I shipped my boat on board a steamship going from Halifax to Quebec, and determined to cruise back along the south shore of the river as far as I could in twenty-five days, (which was all the time I could spare for the trip,) and send my boat to Halifax from where my cruise terminated by whatever means I found most convenient. My brother C. volunteered to accompany me, though the accommodation on board the "Minnie" was certainly limited. We knew the river pretty well as far as Father Point, about 170 miles below Quebec; beyond that we determined to trust to a chart, sailing directions, and information from inhabitants of fishing villages.

We got together wraps, waterproofs, fishing rods, a light singled-barrelled gun, &c., laid in a supply of tea, sugar, bacon, and biscuits: though we trusted to be able to get provisions from villages en route, yet we thought it advisable to have a small stock in reserve. By means of stanchions fore and aft, and using the sprit as a ridge pole, we could stretch a waterproof sheet over the open part of the boat, as a protection against the weather. We proposed putting into a harbor of some sort every night, and either sleeping on board or on shore, as we found most convenient.

It required no little consideration to determine the best way of stowing all our gear into the space we had at our disposal; but by careful packing we succeeded in arranging it so as not to interfere with the working of the boat, and on the 3d of June, at 2 P. M., the Minnie was ready for sailing. The morning had been calm, but with the ebb tide the wind blew up from the east, dead ahead. However, we took each an oar, pulled over under the lee of the opposite shore, and proceeded to make sail. As it was now blowing a pretty stiff breeze, I took down a reef before setting the mainsail, for I have had sufficient experience in boat sailing to know the folly of carrying too much sail on a small craft. "There they goes, a carrying on," was the remark of the old boatman, watching a boat, manned by amateurs, under a press of canvas; "there they goes a carrying on; they fears nothing, because they knows nothing."

The tide was setting down strongly, so we made good way. In one board we reached nearly to the upper end of the island of Orleans, and going about tacked down between it and the south shore, the usual ship channel. Opposite the pretty wooded cove called Patrick's Hole, we passed a number of outward bound vessels at anchor, waiting for a fair wind down the river. At Point St. Laurent the channel narrows, and the wind and tide meeting caused rather a "lop." We shook out our reef after passing this point as the wind fell. Our destination that evening was an island in the middle of the river, called Isle Reaux, opposite the lower end of the island of Orleans; as we got near it the tide gradually failed us, and when we were within a mile the flood began to make, so we took in our sail, rowed to the upper end of Isle Reaux, and cast anchor. The chief, I might say the sole, inhabitant of this island is a Scotch farmer, and old friend of ours, and as soon as we had cast anchor he came off in a "flat" or "dory," took us ashore, and made us welcome, and so we found ourselves in comfortable quarters after our sail of about twenty-five miles.

June 4.—We decided not to continue our voyage to-day as the weather was so disagreeable, raining and blowing hard from the east. We hauled the Minnie up on the beach at

high water, and in the afternoon accompanied our friend M., who was going to take a load of farm produce in his boat to an outward bound vessel anchored about seven miles further down the river. We beat down as far as the neighboring island, Grosse Isle, and landed at a wharf there to visit the island while our friend went on to the ship.

Grosse Isle is used at a quarantine station for vessels with emigrants on board coming up the St. Lawrence. Now when passengers make the voyage from Europe in steamships crossing the Atlantic in ten or twelve days, or in well appointed sailing ships, it is comparatively seldom that they are required to make a stay here, but in by-gone years, when famine and pestilence raged in Ireland, and vessels brought a freight of diseased and starving human beings to America, the little island has witnessed many scenes of woe and misery. In one little burying ground at the upper end of the island over 5,000 emigrants were buried in the season of 1847 alone, who came to America only to find a grave there. We had spent many summers on the island as youngsters, and renewed our acquaintance with the well remembered bays, woods and paths, and wondered that they should have shrunk so much since we had seen them last. We spent about two hours in wandering about the island and seeing our old friends. Then M. called for us on his way back, and scudding before the wind we were soon at Isle Reaux again.

June 5.—We caulked the forward deck this morning, as the seams had opened a little from exposure to the sun at Quebec. At high water, half past two, the Minnie was launched, the things stowed on board, and we got under weigh under sail. The wind was still from the east, so we were close hauled. Our first board was a good one, bringing us to the village of St. Thomas, on the south shore, and we beat a schooner that had got under weigh near us, hollow. We tacked between the south shore, Margaret and Crane islands, and reached the beginning of the "traverse," from the south to north shore. In going over to the Beaujeu bank here, we encountered a nasty sea caused by the shoal and the strong ebb tide setting against the east wind. The "pillar" lighthouse now came in sight on a rocky island, where the first steamship, "Canadian," was run ashore on a clear moonlight night and wrecked. About seven o'clock, when near the village of Lislet, we decided to go no further, and accordingly brought up under the lee of a wharf, made the Minnie fast behind a fishing boat, and landed. An "inhabitant" offered us a lodging in his house, which we accepted; shortly afterwards we met another inhabitant. "Are you not afraid," said he, "of sleeping in a house they have the picotte?" This made us rather uneasy; we didn't know what picotte was, and I thought it sounded unpleasantly like "picotté," (pitted with small pox;) however, there were no symptoms of that disease apparent, so we didn't leave our quarters, but took our supper, made up a bed with our wraps on the floor, and were soon in a state of indifference to "picotte" and everything else.

June 6.—I rose early this morning and found a light westerly wind blowing, so hastened to rouse C., get our gear together, and start. We paid our entertainer for our lodging, and did not carry away with us any unpleasant reminiscences of Lislet. The picotte, we concluded, was not in our host's family circle. We left Lislet about seven, with an hour's ebb tide. The fair wind lasted a very short time, then it fell calm, and we took to our oars and rowed along the south shore, keeping close in after the tide turned. About noon, a point called Point St. Roque was reached, where we put ashore for dinner, and I made a fire while C. went to requisition the neighboring houses for bread. He requisitioned in vain; he was offered some bread made of buckwheat flour, which would have done for ballast had we wanted it, but he declined it as an article of diet. An inroad was therefore made into the biscuit, and after some fried bacon and tea, we spread ourselves out on the sand till three o'clock, when the tide turned, and we got under weigh and continued our row. The south shore of the St. Lawrence is very well cultivated and settled; villages are seen every six or seven miles or so between Trois Pistoles and South Quebec; there is a strong family likeness between

The Log of the Minnie.

NOTES OF A CRUISE DOWN THE ST. LAWRENCE IN A CENTRE-BOARD GIG.

CHAPTER I.

I HAVE always been fond of aquatics, though as far as yachting is concerned I am in the situation of the Lord of Alsace in the Ingoldsby legend, "I can't do as I would, must do as I can;" as I can't afford even a fifteen ton cutter, I do what I can with a boat. Before I left England for Halifax, in 1872, I designed a little craft that was to combine the advantages of a sailing and rowing boat, and to be easily managed by one person. I had her built by a well known Southampton boat builder, who took a great deal of pains with her, and turned me out a very nice little ship. As the style of the boat may be somewhat of a novelty on this side of the Atlantic, I will describe her as well as I can. She is a clipper built gig, with a square and rather full stern, length, 15 feet; width, 4 feet 8 inches; depth, 2 feet, rising at the stem and stern, so as to give about 4 inches sheer. She is decked for 3 feet 6 inches of her length from the bow, and for 2 feet 6 inches from the stern. These decks are connected by a washboard on each side, 12 inches wide; below the decks two bulkheads are fitted so as to make a water-tight compartment fore and aft; exactly amidships a centre-board 3 feet 6 inches in length is placed, the case of which, however, does not rise above the level of the thwart so as not to interfere with the rower. She is rigged for sailing with a sprit, mainsail and foresail on a jib. The mainsail is used without a boom, except when running, when it can be boomed out with a boat hook. The main sheet passes through a small block which travels on a hawse at the stern, and the tack of the foresail is made fast either to the stern or to a small bumpkin 8 inches long. The sprit is made in two pieces joined by a ferule, so as to allow of its being shortened and a reef taken in the main-

them; there is the large church, generally at one end of the village, of wood or stone, with one steeple or two, according as the parish is poor or rich; adjoining this is the house of Monsieur le Cure, cleanly whitewashed, with a black or red roof, a small plot of ground around it, and poplars in front of it. Then the houses of the parishioners, also white and red or black, clustered round as close to the church as they can get. This is the typical French Canadian village, as seen from the river, a good deal of church to comparatively little village. At a point called Point Origneaux, (Moose Point,) where there is a wharf, we put in, and I tried foraging, and was more successful, as I found an inn at the end of the wharf where I got some bread and milk. When we shoved off from the wharf the wind blew up from the east, so we set sail, stood off towards the north shore, and proceeded to try the experiment of cooking supper on board. The spirit stove I brought with me worked well, and we found no difficulty afterwards in boiling water, frying bacon or warming a stew. After two or three tacks we were opposite Kamouraska, about forty miles below Lislet. It was now dark, and as the water is shoal for a long way out here, we took down the sail and rowed in. A small island, marked Crow Island on the chart, gave us a lee, the Minnie was anchored, and we proceeded to make all snug for the night. This was accomplished by shipping the stanchions fore and aft, fastening the sprit between them, and stretching the waterproof sheet over it, then we spread our blankets and rugs in the stern sheets for a bed, and crept under cover. I slept uneasily this first night on board; it came on to blow and rain, the Minnie jumped about at her moorings in a lively manner, and I was afraid of her dragging her anchor and drifting off Heaven knows where.

June 7.—Things looked far from gay this morning. It was raining and blowing hard from the east as usual. However, we determined to go on. So landing on the island we lit a fire and brewed some coffee, after which we felt better able to encounter the elements. The things were stowed on board, a reef taken down at seven A. M., and the Minnie stood out into the channel. Outside, beyond the lee of the islands, opposite Kamouraska, there was a pretty heavy sea. A schooner running up before the wind passed close to us, and all hands came on deck to gaze in wonder at the little boat. At low water, eleven o'clock, we were near St. Andre, and taking down our sail we rowed in under the lee of the point and landed. Now the sun came out and the wind moderated, so taking everything out of the boat we spread our wraps out on the rocks to dry, and enjoyed a little ease after our buffeting. We got under weigh again about three, under full sail. The St. Lawrence is about fourteen miles wide here. On the north the coast is very mountainous, the hills of Les Eboulements rising up to a height of nearly 3,000 feet. In mid-channel are Can Island, and the islets called the "Brandy Pots," close to the south bank the rocky islands called the "Pilgrims." The name of the latter is appropriate enough, as they might easily be supposed to be grey pilgrims; but whence the name of "Brandy Pots?" Altogether the scenery as we saw it from the channel was magnificent. A squall struck us outside the "Pilgrims," and obliged us to take in a reef. We made Riviere du Loup that evening, about twenty-five miles below Kamouraska, and anchored under the lee of the wharf. This place is a fashionable "sea-side resort" in summer, but at this season the "world" had not yet left town, and the hotels and houses for visitors were deserted.

June 8.—We got out from cover this morning to find a breeze blowing from the same old quarter right ahead, so beating to windward was again the order of the day. The navigation between Green Island and the south shore at low water was found to be difficult; there is a narrow channel but we failed to hit it off, got into shoal water, had to get out and drag the boat over mud flats, and at last got into deep water. Then we took to our oars and rowed steadily against a nasty chopping sea, which broke over us and wet us through. After a hard pull we reached a small island opposite the lower end of Green Island, and near the village of that name, where we stopped and went ashore for dinner. In the afternoon the wind fell, and after two or three tacks, we took to our oars again, and rowed on to a broad and shallow bay close to the village of Trois Pistoles, where we anchored for the night. There was a wreck on a reef at the entrance of this bay.

June 9.—We got up early this morning and found the river or sea, as it may now fairly be called, being nearly twenty miles across and salt, perfectly calm. Seal and porpoise were swimming about, showing themselves above the surface of the water and appearing to be thoroughly enjoying themselves. We started at a quarter past four, rowed alongside the wreck, a ship called the Liverpool, and went on board to have a look at her. A schooner along side had just finished discharging the cargo. The hold was full of water, the rigging and gear strewn about the dock, and the whilom good ship Liverpool appeared destined to end her career at "Trois Pistoles." Leaving the wreck we rowed out into the channel and laid our course outside the two rocky islets called the "Razades." There were numbers of seal and porpoise disporting themselves here, and I fired some shot at them without, however, any result. These little digressions delayed us somewhat, and the tide turned and the sun came out hot and fierce while we were some distance from Bic Harbour, which was our destination that day. The flood current is scarcely felt here, however, and in the middle of the river the current is always down, but it would have taken us too much out of our course to have rowed out into it. Between Trois Pistoles and Bic there are no villages. The coast for sixteen miles or so is rugged

and iron bound, the cliffs, as they descend sheer into the water, being called Les Murailles, (the walls.) It was nearly two o'clock when we got into Bic harbor, scorched and rather tired by our long row which we estimated at about twenty-eight miles. Bic harbor is a deep and well sheltered bay, and the scenery about it very pretty, especially at high water on a calm day. Two little green islands at the entrance shut in the harbor from the river; it is perfectly protected from the winds from all quarters, and large vessels can anchor in it in safety. Two little rivers flow into it, one at each corner of the bay. The Minnie was beached, the cargo taken out, and on the sand under the shade of an old stump we made a fire and brewed ourselves some tea, which we found very refreshing after our row. Here I interviewed an "inhabitant" with whom I had a slight acquaintance, made arrangements for billeting ourselves upon him, and after carting our "butin," (booty, as one's baggage is called in Lower Canada,) up to his house, we went up to the village to get letters, and fish the river for trout. We stayed at Bic for two days, got three pretty good bags of trout, at least C. did, from Bic river, and tried "River Southwest," on the opposite side of the bay, for salmon, but this river being a late one we did not see any.

June 12.—Made preparations for a start to-day. This was a fete "de Dieu," strictly kept as a holiday by the simple and kindly French Canadian people. To their credit be it said, that drunkenness or rowdiness is seldom seen on these occasions, as is often the case amongst people calling themselves more advanced.

We got under weigh at half past two, rowed out of Bic harbour, and then sailed as far as Rimouski, about nine miles. This place is quite a town, and can boast of a college. The wharf close to the entrance of Rimouski river excited our wonder. It is nearly half a mile long, and has only about six feet of water at its extremity at low tide. Whether it was worth while "going through so much to gain so little," as the charity boy remarked, when he had got to the end of the alphabet, must be a matter of opinion. The masters of vessels appear to think it wasn't, as they prefer taking their schooners into the river to laying them alongside the wharf. We followed their example, rowed up the river to above a bridge and anchored. We then went ashore, took a walk up to the dam, about two miles above the town, and watched a salmon fisher easting his fly for some time. He failed to get even a rise; the river is a good one for fish, and he told us that he caught many a salmon there, some very big ones. From a hill above the draw we had a pretty view of the little river and its windings, the village and its church, and the St. Lawrence beyond, here expanded to thirty miles. We returned to our ship, and while waiting to be put on board, an Indian fishing from a canoe made fast to the bridge fell into the water, and great was the shouting and excitement that followed. They fished him out in a few moments, none the worse, and probably a good deal cleaner for his ducking. We slept on board, and even at this season the nights were so cold that we required all our wraps and extra clothing to keep ourselves warm.

[TO BE CONTINUED.]

For Forest and Stream.

THE SAGE COCK.

IN compliance with my promise, I send some notes of the sage cock (*Tetrao urophasianus*), and its peculiarities, which I had an opportunity to observe while posted in the Rocky Mountains in 1862, '63, '64 and '65.

The photograph enclosed is from a life size drawing of a male bird made by Lt. Caspar W. Collins, 11th Ohio Volunteer Cavalry, which is now in my possession. A measurement of the picture gives length of bill and head three inches, neck seven, body fourteen, and tail ten inches, total thirty-four inches. Its actual weight in feather was seven pounds, and it was a fair specimen of a full grown male bird, the female being about two pounds less. The attitude is characteristic, half crouching as it steals off when alarmed. The color is also true to life, black and brown, mottled with white, except the breast where white predominates. You will perceive also that the legs are slightly feathered. A remarkable feature of the bird is that it has no gizzard, and in hundreds examined, no seeds, grain or insects were ever found in the craw, or rather paunch, which is very large. This lack of a gizzard indicates it to be a browser and not a grain eater. Its food is principally the artemisia or wild sage, though indications of the leaves and buds of the grease wood and various grasses were sometimes found. I have never met with it where the wild sage did not abound.

A lady who is usually at my elbow and who has seen the artemisia on its native plains reminds me that it is not of the sage family (the *salvias*) but is one of the wormwoods (*Artemisia tridentata*) and as she quotes Prof. Gray upon me I give it up. It is certainly bitter enough to stand at the head of the wormwoods, and I think nothing but the sage cock will eat it.

I notice that some of your correspondents state that it is scarcely eatable on account of the bitter taste caused by the artemisia. Here is the remedy. Immediately after killing draw the bird, thoroughly removing the intestines and their contents, but all other dressing can be delayed till camp is reached. Treated in this manner it has no disagreeable taste. This is what we should expect when it is recollected that in all animals, the peculiarities of food pass off by secretions through the natural channels. The milk and butter of a cow feeding upon wild garlic, cabbage, ragweed, &c., will be tainted with their peculiar qualities, but

the flesh is not. So when the bird is dead the operations of the body cease, absorption commences and the contents of the intestines begin to affect the flesh. The power of life to resist absorption and decay are as wonderful as mysterious. A live fish in salt water continues fresh. The rubbing of salt upon a live hog's back would hardly cure the meat, but when slaughtered it takes up the salt through skin and flesh alike. But perhaps too much upon this familiar principle, unless it serves to redeem this magnificent bird from its unlucky reputation. The flesh is quite dark and rather dry, but when the bird is about two thirds grown, with the bitter taste prevented in the manner I have described, it is not easy for a hungry man to find fault with it, especially in camp. I notice also that a correspondent says that it does not lie well before a dog; I have not found it so under favorable circumstances. When there is reasonable cover its conduct in that respect is better than that of the pinated grouse. But the peculiarities of its habitat do not give the dog a fair chance to work, or do himself or the game justice. The artemisia grows only upon barren prairies from four to ten thousand feet above the level of the ocean, where the soil is composed of dry sand, alkaline clay, granite rocks &c., with little other vegetation but stunted shrubs, cactus, and an occasional clump of wild grass, where rains rarely occur and there is little moisture in the air or upon the ground. It is a tough sprawling crooked evergreen, or rather evergray shrub, from six inches to six feet high, partly deciduous in appearance, much like the garden sage, and when thick very difficult for man, horse or dog to get through. Still where the plants were low and thick and advantage could be taken of the wind, I have had capital sport over pointers and setters. For this work, however, the setter is preferable, as he suffers less from the cold and from sore feet and scratched skin.

The sage cock is a good skulker and runner, and not easily flushed if it can hide. It gets up heavily like the wild turkey, laboring hard with the wings until a proper height is reached and speed is obtained, when it sails rapidly away, and if alarmed often goes from half a mile to a mile before dropping.

The packs are smaller than any other variety of grouse, rarely exceeding ten. They never light upon trees and indeed I have never seen them among the timber. They are rarely found east of Fort Laramie or of the range of Black Hills which constitutes the first step or shelf of the Rocky Mountains going west. The mountain deserts constitute their home. I have met them in the Laramie Plains, on the upper waters of the North Platte, on Sweet-water River, on the head waters of Green River, (the Colorado of the West) on Lewis Fork of the Columbia, and on Wind River, but no where so numerous as on the latter stream and its tributaries, where scores would be often seen in a mile's ride.

The sage cock is also said to be common north nearly or quite to the British line, and west to California, but in these observations I have confined myself to the sections I have personally visited. It would be safe to presume that they would be found wherever there was a barren prairie stocked with artemisia.

Details of the localities and limits of birds and animals and the change in dress, habits and character arising from the influences of climate, food, &c., are very interesting and I am pleased to see the encouragement given by the FOREST AND STREAM to the publication of the facts upon these subjects.

I have heard it said that the sage cock migrates, but this is not so, as I have seen them at all seasons of the year on the same ground. In this respect their habits are the same as other varieties of grouse, never moving far from the spot where hatched unless compelled to do so. The idea no doubt arises from the fact that they are rarely seen moving in the severe weather and terrible storms of this region; their habit being to lie close in ravines and hollows and dense thickets of artemisia where they can have food and shelter.

VETERAN.

REMINISCENCES OF NORTH WOODS.

BY A SPORTSMAN'S WIFE.

AFTER we had been in the woods some two months we were very pleasantly surprised one Sunday afternoon. The Mac—s who had moved into the woods some three miles from us, for the purpose of making shingles, had come to make us a neighborly call. They were sensible, kind-hearted people, and I still look back to our visits with pleasantest of memories. A woman's face did look so good, and a real good gossip was so enjoyable after having seen none but masculine faces for such a length of time! The gentlemen were all very nice in their way, to a certain extent I could share their enthusiasm in shooting and fishing, could make their flies, repair the "accidents by flood and field," in short be generally useful, and they appreciated it (especially after a night at some rough backwoods shanty, where corn, coffee, and salt pork were the rule) and would do anything for me, pick strawberries for my short-cakes (would that we could have some now), if I had a head ache would scrape out the frying-pan "all ready to use again," or any other kindly deed, but they couldn't sit down with sewing in hand and join in the delightful chit-chat that women can. Poor things, they didn't know how! So Mrs. Mac—s coming was a blessing to me, and many were the delightful visits we had. Her womanly appreciation, sympathies and neighborly kindness, were very sweet to me and are still tenderly remembered.

It was on the return from her house at one time that I experienced one of the decided sensations of my life. G— had gone over on an errand one morning and returned with the sad intelligence that Mrs. Mac—s was very ill with pneumonia. Having had considerable experience with that troublesome disease I hastened to go to her, arranging with G— to meet me at sun-set at an old shanty halfway between our houses, the road to which was through a dense spruce thicket—the rest of the way through more open forest.

I left Sancho Panza (my dog) safely shut up at home fearing he might prove troublesome in a sick room, as he would not leave me a moment could he help it. I reached Mrs. Mac—s safely and had the pleasure of finding my prompt measures brought her great relief, so that by night she was out of danger, but it was sunset before I could leave her. I trudged hopefully on to the shanty to find utter silence and no G—. Surmising he had been and gone, I fired my revolver several times only to "set the wild echoes flying," and so I reloaded and started on through those dense spruce woods. There's no need to tell an old hunter how very dark it was there. If "Egyptian Darkness" was any more intense, those Egyptians have my warmest sympathies.

I was nearly half way through the woods when startled by a sudden snuffing a few feet to my left in the thicket, I stopped, a thoroughly scared woman. Mr. Bruin, (for it was a bear) snuffed several times and declining further acquaintance, to my great relief went crashing off through the under-growth, and I, well, I sat down awhile and rested—not quite a dead faint but nearly so. After a time I got up and walked along; even had I not been too tired to hasten the path was so rough that I had to step carefully.

At last I could hear home sounds, the lowing of the cattle, G—s voice, and Sancho's bark, and then I "lifted up my voice" and called Sancho. Almost instantly came his quick joyful answer, and I sat down and waited, knowing it would not be very long before my special guard and protector would be with me.

Sancho Panza was a large black and white bull dog, weighing one hundred and two pounds, the truest of friends, and most zealous and vigilant of protectors for the special woman or chief placed in his care. While gentle as could be to his wards, he would not hesitate to take any man or beast by the throat if he feared danger for his charge. It was not many moments before the glorious old fellow was with me, and then, all fear gone, we pursued our way toward home, reaching there greatly to G—s surprise, who had been to the shanty and concluded I was not coming home, and was just wondering what had taken Sancho off in such haste, utterly heedless of his whistling and calling.

IN FORMOSA.

NUMBER ONE.

WE, the General, Consul Dodd and I, were enjoying ourselves; a delicious cooling breeze was evaporating the caloric with which a broiling Formosan sun had thoroughly impregnated the earth and air, and all that in them were; a good dinner in which the native venison, ducks and boar meat, pine apples, liechees, and bananas, had been well relieved by luxuries of all the sorts that cans and jars and bottles could bring intact from far off England had been discussed, and at our ease in hyjammass and slippers, with Manila cheroots and Bass' pale *ad libitum*, we were proving to our own satisfaction that even in this far off land comfort was attainable. We were in Dodd's dining room, and his dining room the dining room in the town of Tamsui, which is a little village in the north-western part of the Island of Formosa—a village where half a dozen white men, including Dodd and his twenty-six dogs, maintained with pluck and brains supremacy over a tribe of several hundred of an odd people, once through their forefathers Chinese, but now natives to the manor born. But a day's good run from Amoy, on the China coast, it seems in its quiet to be almost in another world.

Dodd was a good fellow and entertaining, and on Formosan affairs was considered authority, and we listened with interest to his yarns. Rumor said that a dusky princess among the Cannibals claimed our Consul as her liege lord, and that through this influence in court circles he held a talisman which gave him peculiar facilities for wandering among the mountains, and even encountering the dreaded "Hill Men," and returning uneaten. Be this as it may, he neither denied nor affirmed it, and on this delicate point was not communicative, but of his travels, trips and adventures, pow-wows with savage chiefs, flirtations with cannibal maidens he told, and as we saw him after all his perils sitting safely in our midst, surrounded by a dozen or so of the more favored of his canine family, we too were fired with the spirit of adventure, and resolved that the morrow should see us on our travels in search of the picturesque.

Time though was limited, and between the rising and going down of the next day's sun we must condense our wanderings. So after voting down the Camphor forests and manufactories as too far away, the Keelung coal mines as not interesting enough, we settled unanimously on the Sulphur mines as being the very trip we wanted; so the Compradore was called and instructed to prepare such creature comforts as the day's excursion would call for, the head boatman received his directions, and thus, having with a word or two to retainers, (such is life in the Orient,) made all of our preparations, we again abandoned ourselves to lazy comfort.

The General was no novice in Formosa matters, his lusty

legs had carried him over many a mile of mountain tramping, and to his cool, clear head, his indomitable courage and his knowledge of human nature, displayed alike in his dealings with the simple but brave natives, and crafty, yet cowardly Chinese, many a poor ship-wrecked cast-away had owed his life, and had been spared a fate like that of the unfortunate Captain, wife and crew of the American ship "Rover," who had been slaughtered in cold blood.

Let me digress for a moment and briefly tell of the fate of these unfortunates. In 1867 the American clipper ship "Rover" struck upon reefs and was wrecked off the south-east end of Formosa. Captain Hunt, his wife and crew succeeded in reaching the shore. Seated on the sandy beach, at breakfast, a volley of musketry from hidden foes sent them all into eternity. They had braved the elements, but "Man's inhumanity to man" destroyed them. Naught was heard of their fate until the General heard from the lips of the Chief of the Tribe the manner of the sacrifice. Le Gendre's march across the mountains with the Chinese troops, whom he had persuaded the Emperor or rather Prince Kung, to place under his command, his cutting a road for artillery through the dense forests of teak and camphor trees, his building of a fort, and then when thus prepared for war, his starting off unarmed and unattended, except by an interpreter, to interview the savage Chief, were feats of pioneering, which will forever associate his name with that of the Island. What Daniel Boone was to Kentucky, was Le Gendre to Formosa, and the latter was able to appreciate his own field of work, for he was lawyer, doctor, chemist, geologist, mineralogist, diplomatist, and soldier combined, and with all a *bon compagnon*—brave as a lion, gentle as a woman, gay as a Frenchman, and as cunning as Machiavelli. Then to describe the interview, when seated on the green sward, both unarmed, for when old Tauki-tok saw the noble courage and generous confidence of the White Chief, he too sent away his arms and escort, and the two extremes of chivalry met on a common ground, and the savage succumbed to a moral force he could not counteract and forswore forever the vow that had been taken to last forever, and so ruthlessly kept, that all white men falling into their hands should suffer death. Two Chinese Mandarins of high rank had accompanied the expedition to make terms for themselves, for between the "Sabarees," as the Aborigines of southern Formosa are called, and the Chinese there was deadly enmity. They too, sought an interview. "No," said the stern old Chieftain, "the Chinese are women, they cannot see me. Brave men to brave men, women to women; I will send my daughters to talk with them, but it will be of no use. I will kill them wherever I find them," and under escort of the General he did send them, much to the celestial mortification and chagrin. But to return to Tamsui, here sat the General after all of his exploits, as much at his ease as the rest of us. I use the term "the General" so frequently that I must explain that it is legitimate, a five years' service in our war, during which his body became a perfect lead mine; surely the General, with his crippled wrist, bullet-pierced face and shoulder and without his right eye, had earned the title which a full commission had given him.

I was the only novice, my experience of this part of Formosa had been limited to the walk from the wharf to Dodd's home, but I too, had met my perils, or thought so. As I landed, some twenty ferocious-looking enormous dogs came rushing toward me, giving tongue in every note of the gamut. In a moment I was surrounded, but to my delight, with friends; they all seemed to welcome me as an acquaintance, and bounding around and ahead of me, blood-hounds, kangaroo-hounds, mastiffs, deer-hounds, escorted me to the Consulate. But one, a nasty little Chinese cur showed any sign of hostility, and he was soon squelched by a large mastiff, who construed a snap the cur made at me as an insult to himself, and shook him accordingly. This admirably trained pack have seen but few Europeans, and they always in the capacity of friends, so not one of them thought of molesting a foreigner, but woe betide the luckless native whose bump of acquisitiveness should lead him to stray within the Consular Compound. Their reputation was spread far and wide among the natives, and under its aegis we slept in security.

Morning came—a lovely one for our purposes; instead of the hot, calm, sweltering atmosphere, usual at this season, a strong north-east gale was blowing, and pile after pile of thick slate-colored cumulous clouds came driving in from seaward and hid us from the devouring gaze of Old Sol. We had an eleven mile trip before us, eight by water, then two by paths across the plains to the foot of the mountains, then a mile to the summit, where amid eternal desolation and murky atmosphere, old Mother Earth gives vent to inward grief with sulphury tears, and with great sobs and gasps and sighs, relieves her inward troubles. Our boat was a fast and comfortable gig, propelled by six sturdy native oarsmen, and another followed with our Commissarial and Coolies. As we swiftly slid along the smooth river, we enjoyed a panorama both beautiful and strange. Little bays with flat lands green with the young rice, hills three hundred feet in height were terraced to their summits, and every inch was under cultivation; little Chinese villages, with mud huts, tiled roofs and quaintly ornamented temples or "Joss houses," tucked away in sheltered corners; immense banyan trees, each tree a grove in itself, fishermen standing on the banks, naked but for a clout, like bronze statues, or from their campans skillfully casting their nets; duck tenders surrounded by hundreds of their waddling charges, and tremendous water buffaloes, with great corrugated horns and wicked eyes, feeding quietly along the banks, or catching our scent as we passed, eyeing

us viciously, and betraying a disposition for a closer acquaintance, all these and many more curious sights added to the zest with which we enjoyed our holiday. From the river we turned into a narrow creek, and then soon into one still narrower, between whose sedgey sides our boat had barely room to push along, and thus winding our way into the heart of the country, the creek diminishing to a mere rivulet, we finally reached the head of navigation; and at a little stone landing worn down like the steps in Pompeii, by the naked feet of generations, we disembarked and prepared ourselves for a tramp across the rice flats. Far as the eye could see the country was squared off by raised paths, dividing adjacent plots of rice. The young shoots were just peeping above the surface of the water with which they were flooded. Here and there a clump of bamboos marked a spot of more solid ground, and hidden away among the shrubbery, we found as we approached cosy little villages, whose quaint architecture proclaimed the Chinese descent of the inhabitants, and whose people kindly welcomed us and feasted us with tea and cakes, and refreshed us with pipes and samshu. PISECO.

[TO BE CONTINUED.]

FORAGING FOR ALLIGATORS—A MEXICAN WAR EXPERIENCE.

AS an article of diet perhaps the alligator may not be considered a success by those possessed of epicurean tastes, and I shall not attempt the task of convincing such that alligator chops or alligator fricassee deserve a place in the bill of fare at Delmonico's. Nevertheless, I do affirm that having partaken thereof it was found to be a toothsome dish. I will be frank, however, and state that it was served with that best of sauces, hunger. This by way of preface.

In the latter part of the winter of '48, during the war with Mexico, detachments of several regiments of volunteers were at Camp Washington, near Vera Cruz, to one of which I belonged. Drill, target practice, and an occasional scout after guerillas occupied the time while waiting to do escort duty for a Government train for the city of Mexico. One afternoon the "Kentucky Rifles" were having their practice, as usual, at a target painted upon the baggage board of a train wagon, and propped up on the edge of a sluggish creek which bordered one side of the camp and was filled with a rank growth of reeds. Most of the soldiers were off duty, and gathered around watching the superior shooting of the boys in dark blue. Just as one had stepped the usual two paces in front a huge alligator thrust his head out from the reeds near the target, and turning it jauntily to one side rolled up his eye, presenting a beautiful mark, on which the marksman instantly drew a bead, sending the ball crashing through the eye and brain, and lodging beneath the skin at the base of the skull on the opposite side. The shot was fatal, and soon the carcass was skinned, cut up, and divided among the men; a small portion of it falling to my mess. While it was cooking I mentally reviewed the different kinds of game I had partaken of since becoming a soldier, commencing with crow stew at Fort Hamilton, Long Island—which was a *dernier resort* after the hen roosts of the farmers in the vicinity had ceased to honor our drafts—which my stomach rejected, owing perhaps to the too sudden change from turkey and chicken, and ending with parrots, two of which I had shot and eaten the day previous, the same having been broiled on the coals undrawn, and were delicious.

The gator meat was soon cooked and disposed of, and declared by all to be very nice, and before we separated it was agreed to ask the orderly to substitute us the next day in lieu of the regular detail for police duty; three of us to smuggle out our muskets and hunt for alligators. We were accepted, and left camp with muskets rolled up in our jackets and serenely hidden under the water casks in the wagon. After getting beyond the main guard we separated, Jack H., Charley P., and myself constituting the foraging party.

Making a detour around the camp to the creek we began beating in supporting distance. Less than fifty yards had been covered when the violent swaying of the reeds seemed to indicate our quarry. The game failing to show itself, we became impatient, and fired in the direction of the swaying reeds. Imagine our consternation on beholding, as the smoke lifted, not an alligator, but instead the head of a monster snake. Fear possessed us, and we started on the double quick, but finding we were not pursued halted and held a "council of war." Even at this late day I cannot recall the demoniacal expression of the reptile without a shudder. I have experienced the terrors of a storm at sea, been surrounded by a pack of snarling wolves, chased by a wounded wild bull on the table land, and been the target for an ambushed guerilla escopet, but neither nor all combined begat such blood-curdling fear.

We reloaded, fixed bayonets, and cautiously advanced to within fifteen yards. At that distance we discovered a severe wound, about a foot back of its head. A ball had cut open the neck nearly to the spine, causing the head to droop somewhat. Its piercing eyes and darting tongue of fire seemed literally to rivet us to the spot. Charley P. only seemed possessed of his faculties, and gave the word to fire, and three bullets and nine buckshot did their duty, and cut its head entirely off; but it was several hours ere its writhings ceased to allow us to drag it out on the sward, which was accomplished by thrusting bayonets through and lifting while standing astride it. We found it had gorged itself apparently within two or three days with an animal the size of a small deer, which accounts for its not pursuing us. We hunted no more alligators that day, but returned to camp and related our adventure, but most of our comrades pulled down the under eyelid and requested us to "tell it to the marines." The captain, however, gave it some credence, and the following day took his command out for target practice, and made it in his way to visit the locality, where a sight of the monster proved the truth of our report, and Captain C. assured us it was a bona constrictor, and our escape from destruction by it providential. The creature measured seventeen feet. C. L. W.

For Forest and Stream.

MUSINGS.

WHEN 'mid the woodland glades we roam,
 Afar from crowded city home,
 Far from the busy mill or mine,
 Far from the gilded haunts of crime,
 We seem to rest from care and pain,
 And peace comes o'er the weary brain.

Then musing here, and dreaming there,
 Deep drinking in the sweet pure air,
 Or stretched beneath some shady elm
 That waves its top in higher realm,
 And seems to us prone at its foot,
 Like a vast emerald parachute.

Oh! lovely is the clear blue sky,
 And the white clouds which thro' it fly
 All day, then gently as a nun,
 Wait benediction from the sun;
 Who, ere he doth retire to rest,
 Lays on each brow a golden crest.

And sweet to us the fluttering leaves,
 And the caresses of the breeze,
 And dear the gurgling brook, which laves
 The feet of flowers that o'er it wave;
 And sweeter yet the peace that falls
 When moonlight flows o'er twilight's walls.

When paved are the wooded aisles
 With russet, gold and scarlet tiles,
 And thro' the royal autumn day,
 Resounds the hound's deep mellow bay;
 With swelling hearts we quaff the air,
 And dream there ne'er was world so fair.

But when from nature's scenes apart
 Unworthy thoughts will upward start;
 Thoughts that beneath the forest's shade
 Would never dare our hearts invade;
 Friends in their thirst for gain grow gray
 And misery haunts the crowded way.

Yet, after all, the grief we meet
 But makes the sweetness seem more sweet;
 The more we see of falsehood's blight,
 Makes truth more precious in our sight;
 And from life's sea did no rocks rear,
 We carelessly our bark would steer.

 ists' Association.

PRACTICAL FISH CULTURE.—NO. 3.

HANDLING SPAWN.

AFTER taking the eggs either on the screens or artificially, as described in the two last articles, they require washing. If they have been taken by hand, all that is necessary is to free them from the milt by changing the water in the pan several times after allowing them to remain undisturbed for half an hour from the time of adding the milt. To clean eggs taken from the screens is much more of a job as they are found mixed with more or less dirt consisting of sand, sediment, small stones, bits of rotten wood, decaying vegetation, and perhaps fine feculent matter; in fact everything that is carried down stream by the current and is fine enough to pass through the upper screen.

The first point is to gradually raise the temperature of the water in the pan which came from the pond, to that of the spring which supplies the hatching house, if there is any difference between them; do this by allowing a small stream to flow in for a few minutes when a stronger head can be turned on and much dirt will run off. Trout eggs are somewhat heavier than water, and if care is used they need not go over with the dirt, but it is well to have another pan below to catch any that might escape from a new hand; the pan is then taken away from the stream, and by a few gentle shakes, all the eggs, gravel, &c. are deposited on one side with the stones at the bottom. When by tipping it the other way, the eggs flow off and the heavy substances remain; these can be swept over the side with a feather. The hardest things to remove are the particles of water-soaked wood, which are about the size and same specific gravity of the eggs; to get rid of these, get everything on one side as before and pour off most of the water, then tip back very gently, leaving eggs and dirt out of water, after which support the pan steadily in that position and feather the eggs down the sloping bottom and brush the dirt back, after which pour the eggs in a clean pan, and if necessary, repeat the operation or raise them as they may seem to require. To feather them in this manner requires a skilled hand and a delicate touch, which only practice can give, and the beginner will often find his eggs and dirt mixed by a careless movement just as they were about separated. I have confidence that before another season I will have a device for washing eggs that will save much time and trouble, and if I do, the readers of FOREST AND STREAM will be advised in time to use it, which they can do freely as it will not be patented, as seems to be the fashion to do with every little thing that is originated now-a-days, whether it has cost any outlay of brains or not. In pouring spawn from one vessel into another always dip the edge of the one containing the eggs under water before pouring them out, as it does not hurt an egg to fall any distance in water, but it is easily killed by pouring through the air and striking the surface of water.

An unimpregnated egg is easily killed—if it ever lived—by handling, and many of them show, both after washing and the day following, that they could not stand such rough usage, but they are always ready to die, and it is only a question of a few days with them at most; the same thing is observable in packing them for shipment. There

are several articles in use among fish culturists for removing dead eggs, fish, &c. from the troughs and pans, some prefer a bulb syringe, and other a sort of spoon, made of fine wire and set in a wooden handle, but nippers are in more general use; these are sometimes made of a slip of steel and are very handy. I have usually made them of a slip of whalebone about ten inches long, bent in the middle around a block, the ends nicely tapered down to a little spoon-shaped cavity of half the size of an egg. I have seen very nice ones made of cedar, sawed up like a clothes pin; but the best pair I ever saw are now in my hatching house; they are made of two pieces of wood about five inches long, with the upper ends beveled so that they touch for about an inch; they are bound together with thread, and the tapering ends are finished with a loop of fine brass wire neatly whipped with silk. The long taper gives a very delicate grip, and I can not only pick up a live egg with them without injury, but I believe I could also pick up a thousand fish with the sac on without injuring ten of them. This instrument is used in the most delicate operations that the fish culturist has to perform, and therefore when he finds a pair whose delicacy exceeds that of any previously used they become dear to his piscicultural heart, and while any of his other implements can readily be replaced, the loss of his favorite nippers seems almost irreplaceable.

Trout spawn is packed for shipment by express in tin boxes, three inches in diameter, and as many in depth, the bottom of the box is perforated to drain the water off, which, if allowed to remain without circulation, would kill the eggs. A quantity of soft living moss, such as can be obtained from the swamps, is procured, well washed, after which the green fibres are cut off with scissors and the roots and dead parts thrown away, the bottom of each box is covered with a layer of this moss and the box is then put in a pan of water, a thousand eggs are measured and put in a dipper and a layer of eggs put on the moss and so on, moss and eggs alternately for three or four layers, after which the box is removed from the water to drain, this settles it down much, and it is then filled with more moss lightly pressed down until full, when the cover is put on and tied down firmly. The box or boxes are then packed in a box or pail of sawdust which keeps them from changes of temperature, are marked "fish eggs, handle carefully, keep cool, but do not freeze," and delivered to the Express Company. A fish egg will not live in water that does not contain oxygen any more than a fish will, and the living moss not only furnishes the egg with a soft cushion to protect it from sudden jars, but keeps the shell moist and furnishes it with the requisite oxygen to sustain it. That it does it well is beautifully illustrated by the fact that the process of hatching is not at all interfered with by this packing; to prove this I packed a lot some years ago and left them in the hatching-house for two weeks, and after replacing them in the troughs, found that they hatched at the same time that the remainder of the lot from which they were originally taken did.

There are other methods of packing, as using flannel stretched on frames, instead of moss, but never having had any practical experience with them, I cannot say as to their merits. The plan described above is the only one I have ever used, and of the many lots of eggs that I have packed and shipped, I have never had a box spoiled; the only objection to this method which has been sought to be overcome by those who have used flannel, wire, &c. is, that of keeping the eggs free from the particles of moss and dirt which will remain after the most careful washing, and Mr. Theodore Lyman obviated this by enveloping each layer of eggs in a fold of mosquito netting.

On receiving a package of eggs by express, take them to your hatching house, if you have one, or if not, put them in the cellar or any other place that will keep them as the directions say, "cool, but do not freeze," and do not open the pail or box until all is ready to put them in the troughs; be very sure not to put them in water, for if you do *they will surely die*. Caution on this point is most especially necessary, for it is the most natural place in the world for a novice to think of putting them to keep over night. But when the troughs are all ready, raise the water in them to about two inches, and take a deep pan full of water, and after removing the tin boxes from the saw dust, wipe them off and put them in the water upside down, remove the cover and lift off the box, remove all the large bunches of moss and wash away the rest as described above, dip the edge of the pan under the water in the trough and pour them in, distribute them evenly with a feather and let the water down. In all operations with spawn it should be moved under water; avoid sudden jars and changes of temperature. An expert will by a few strokes of a feather, bring all the eggs in one compartment of a trough into a pile in the centre and distribute them again by a few more without touching an egg, and as they are moved entirely by currents of water they are not injured. Great care must be used in the beginning not to kill two eggs with the nippers while taking out one already dead; after you have acquired experience in handling them you can touch them with the feather or even push them aside with the nippers without injury, but at the start you will find that they are easily killed. An egg that is killed does not show it immediately, in fact it seldom does, but a man has been known to keep on killing a number of eggs one day and picking them out the next, until he had nearly depleted his trough, when he thought that "those eggs were a bad lot." If eggs are only to be transported a short distance and carried by an interested party, then they may be taken in water which can be aerated or changed, or they may be packed in moss in a basket.

FRED. MATHER.

LETTER FROM SETH GREEN.

THE TRIALS AND TRIBULATIONS AND EARLY EXPERIENCES OF A PRACTICAL FISH-CULTURIST.

MY first attempt at taking brook trout spawn was in 1864. I took a few thousand daily for sixteen days. On the seventeenth I made up my mind that I could tell which spawn was impregnated and which was not. I counted several hundred and found that I had twenty-five per cent impregnated. I was sure I had to pick out all of the bad ones. I did not like the job. About that time Mr. Ainsworth came to my place. I told him what I had discovered. He said that twenty-five per cent was a good percentage as ever had been hatched. I was not long in making up my mind. If that was the best that could be done, I should not stay in the business long. That night I thought it over and took a common sense view of it. I had used a good deal of water, and but little milt. I made up my mind to try a little water and a good deal of milt. I found when sixteen days had come around that I had ninety-five per cent impregnated and even better. I kept using less and less water until I used scarcely any. I kept it a secret as long as I was in the spawn-selling business; every body wanted my spawn. I sold a great many, and my secret was as good as though I had a patent for it.

I will tell you how I discovered that the sun would kill spawn. The spawn in one of my troughs kept dying and in all the others they were good. I picked them out for several days and tried several experiments, but it was of no use, the spawn kept turning white. So I thought I would leave it for two or three days. The third day I learned the cause. The sides of my trough were six inches high, and the side shaded one half of the trough, and the shady side was all good, and where the sun hit they were all bad. I left them a couple of days and scooped them out and shaded my window, and I did not have any more trouble from the sun. One of the one hundred and one difficulties I had to overcome was rats. They left their tracks and I caught them; I took 304 trout spawn out of one of their stomachs.

I must stop telling you the difficulties I had to overcome or I shall not have time to tell you about anything else. The year 1867 the Commissioners of Fisheries of four of the New England States came to my place and wished me to go to Holyoke, on the Connecticut River, and see if I could make a success in hatching shad artificially. I agreed to go. I arrived at the fishery at South Hadley dam and told the people that I had come to hatch shad artificially. They thought I was crazy and treated me accordingly. My first experiment in the use of hatching apparatus was to build the same kind of troughs that I used for hatching trout, with the exception that I slanted some of them a great deal more than I did others. I put the spawn in the troughs and I found that in the troughs that had the most fall the spawn floated down and out of the end. That was the first time that I had discovered how light the shad spawn was. It is as light in the water as a bubble is in the air. The next morning I came to see my troughs; they were nearly all broken down by some malicious person. I fixed some of them so that I kept the spawn in the trough, the next day they were nearly all dead. I could see the fish begin to form, but it was suffering for lack of circulation of water. The next day they were all dead. I saw what I had to contend with. I saw that the spawn needed a great circulation of water, and the difficulty was to get some thing that would give them the circulation and not float the spawn away. The second day I had a dozen different kinds of hatching apparatus. All failed until the sixth day, when I was standing in the water with a candle box with a sieve bottom, and tipping it one way and another until I tipped the lower edge so that the current struck the bottom. The spawn began to boil up and kept in motion. The mystery was solved! The second day the fish showed life in the eggs, and the next day they hatched. I made two trials to see what percentage I could hatch. I put ten thousand eggs in the box and hatched all but seven eggs. The next trial I hatched all but ten. The Commissioners and everybody was delighted—myself in particular. In about fifteen days I hatched fifteen millions, and in 1870 the Commissioners of Fisheries reported that there was sixty per cent more shad in the Connecticut River than there was in the year 1862, and I believe the fishing has been as good every year since.

In 1869 I experimented in hatching whitefish. I took the spawn in the same manner that I do the trout, except that they have to be stirred gently for twenty minutes to keep them from sticking together. I have hatched a good many every year since that time. I hatched them the three first years on gravel and on trays four inches deep in the trough. Last year Mr. M. G. Holton invented a hatching box that will be the means of stocking all of our great lakes with whitefish and salmon trout, equal to their best day, and I believe it can be done in four years. It saves nineteen-twentieths of the room in the size of the house, and can be taken care of with one half the labor required for any hatching apparatus that I have seen. I have used ten of Holton's boxes in our State Hatching House this winter, and find them a great success in hatching salmon, salmon trout, brook trout, and whitefish.

I have hatched fifteen different kinds of fish artificially, viz., brook trout, white fish, herring, shad, Otsego bass, wall-eyed pike, salmon trout, salmon, red side suckers, creek suckers, shiners, white and yellow perch, mullet, striped bass, frogs and lobsters.

—We learn from Caledonia that all the whitefish at the State Hatching House have been distributed. There are plenty of salmon trout and a few thousand California salmon left.

THE DANUBE SALMON.

WE are permitted by Professor Baird, United States Commissioner of Fish and Fisheries, to publish, in advance of its appearance in his report on the propagation of food fishes, a very interesting article on the Danube salmon, written for him by Mr. Rudolphe Hessel, of Offenbourg, Germany. Mr. Hessel is one of the most practical and accomplished fish culturists in Europe, and has been, to a large extent, employed by the Prussian Government in this connection. It was under his direction that the quarter of million of salmon eggs presented by the German Government to the United States in 1872 were brought over, to which were added half a million more, purchased by the United States from Mr. Schuster, of Freiburg. Unfortunately, the excessive and unusual temperature of the winter season in Germany affected these eggs so that when transferred to the hatching establishment of Dr. Slack, at Bloomsbury, a considerable percentage was lost. Thanks, however, to the care given to them by Mr. Hessel, on the voyage and subsequently, the damage was less than might have been expected with almost any other specialist.

Mr. Hessel is, we believe, now a resident of the United States, and was in the employ of Professor Agassiz during the summer of 1873 in establishing aquaria and fish ponds on Penikese Island.

While in Europe Mr. Hessel paid a great deal of attention to the cultivation of leeches, crawfish, and other out-of-the-way branches of pisciculture, and it is much to be hoped that he may be induced to undertake something of this kind in the United States, where the field is so ample. The cultivation of crawfish has never been attempted, we believe, in this country, although there is a very large demand, and one that is increasing very rapidly.

There is much to be said in regard to the propriety of introducing the Danube salmon into American waters, as, unlike other species of salmon, it does not leave the rivers, but feeds upon whatever it finds therein. Mr. Hessel is of the opinion, however, that it is much less destructive than such fish as the pike, etc., and it is probable that this will be an exceedingly valuable fish for localities where neither the eastern salmon, nor that of California, can be sustained.—

"Professor S. F. BAIRD,

"United States Commissioner:

"The Danube salmon differs from the other *Salmonidae* by its more cylindrical and elongated body. The back is of a dark brownish green; the belly, silver white, and on its sides are black, round, and half-moon-shaped spots, which are more crowded along the upper part of the back; in this exhibiting a resemblance in marking to the sea trout.

"With increasing age (fish of 12 to 20 pounds and more) the sides exhibit a reddish tint, which becomes of a beautiful rose color during the breeding season, and gives rise in some places to the name of 'red fish,' not to be mistaken, however, for the 'Röthel,' (*Salmo umbla*, or *salvelinus*).

"The Danube salmon surpasses all other *Salmonidae* in size, and attains a weight of 40 to 60 and 100 pounds. In rare cases, specimens of even 120 pounds have been caught. Its flesh is almost like that of the salmon of the Rhine in quality, but is white, while that of all the others of German *Salmonidae* is red.

"A special peculiarity of this fish is its limited geographical distribution, occurring only in the streams emptying into the Black Sea, especially the Danube and its tributaries. When young (weighing from 12 to 18 pounds) it has its abode in the deep, rapid, mountain branches of the Danube, and afterward descends into the river itself, in the lower portion of which, near Galatz, Semlin, etc., it is found of fully developed size. The rivers Drave, Save, and Theiss, the principal southern tributaries of the Danube, also abound in full grown fish. It is also frequently caught in the northwesterly tributaries, above Vienna—the Inn, Lech, Isar, Salrach, Altmüll, Regen, Iller, and even the small Brenz; indeed, generally, everywhere in the Upper Danube of Wurtemberg. Except as indicated above it is to be met with nowhere else in Europe. It also occurs in the Black Sea, but only near its shores, and also in the Dnieper, which discharges its water into the Black Sea near Odessa; likewise in the Volga, Ural, Vurur Rivers of the Caspian Sea.

"The Danube salmon has not the peculiar habit of migration from the sea of the true salmon (*Salmo salar*), though it also ascends the rivers to spawn, like most other *Salmonidae*. Differing from the other European salmon, however, which breed in autumn or winter, it deposits its eggs in March, April, and May, the female making large cavities in the middle of the river for the purpose, called by the fishermen of the Danube 'bruch,' (break). Accompanied by several males, the female fish deposits its eggs at the bottom of these excavations, and while thus engaged are easily caught with the 'trident,' or fish-spear, and even after one of the males has been taken out the others leave the place only for a short while to return and meet the same fate. Many fish are thus captured during the breeding season, greatly to the injury of the fisheries; and although laws prohibiting this mode of fishing during the breeding season have been enacted in all the littoral states of the Danube they are mostly evaded.

"The eggs of the Danube salmon have a diameter of about .20 of an inch, and their yolk is not a connected mass, as in the eggs of the other *Salmonidae*, but is distributed in oily drops upon the entire inner surface. A period of forty to fifty days in cold weather, even more, is necessary for hatching. The eggs are rather sensitive, and suffer greatly from the rapacity of the grayling, *Thymallus venosus*, Agassiz, which exist in great numbers in the tributaries of the Danube. They follow the female *hucho* in shoals, and voraciously consume the eggs. Hence this beautiful fish is never so abundant as the *Salmo salar* in the Rhine, where the *Thymallus* is far less numerous than in the Danube. In addition to this, the season for depositing their eggs is far more favorable to the *S. salar*, since then the *Thymallus* are full of milk and eggs and less hungry than at spring time, when they have just done spawning. The young fishes lose their yolk bag after ten to eighteen days. They have a length of .80 of an inch when hatched, 6 to 6.80 inches when six months old, and

24 to 32 inches after two years. This rate of growth is quite favorable, when compared with that of the European brook trout, but is less than with the other *Salmonidae*, which, migrating to the sea, there find richer nourishment than the *hucho*, which generally remains in the river. Since the *hucho* does not enter the sea, it appears especially adapted to the large lakes of America, as well as to the Mississippi and its tributaries.

"In its third year the *Salmo hucho* attains its maturity for propagation. Before that period it prefers to remain in the small rivulets; but when sufficiently grown prefers the most rapid places of the larger tributaries, where rocks, trunks of trees, etc., offer shelter. Like the *S. salar*, it ascends obstructions several feet in height, sometimes six to eight. Like the other large *Salmonidae*, it is a rapacious fish, neither more or less so than its congeners of equal size, but is, I believe, decidedly surpassed in voracity by *Silurus glanis*, or sheat fish, a kind of cat-fish, and the pike, *Esox Lucius*. The daily consumption of food of the last mentioned species, according to my own observations, amounts to one third of its own weight. The *S. hucho* has a bad name for voracity, because it is not at all dainty; it preys on its own kind, catches frogs and water fowl, and even does not refuse water rats. But, after all, it consumes, in proportion to its size, far less than the smallest trout; and the most reliable fishermen of the Danube agree with me in the opinion that it is not as bad as reputed. True, it shows greater energy in pursuit of food, but this occurs principally in winter time, when most of the other fishes remain in their hiding places and the river is covered with ice. In such cases it frequently jumps high up the banks, where it is easily killed.

"I have often examined the stomachs of these fish of different sizes, and mostly found white fish and frogs, sometimes salamanders (*Triton cristatus*), and once even a ring snake, *Tropodonotus natrix*.

"I believe that in the sluggish southern waters of North America the numerous salamanders would serve as food, as the *hucho* loves to hunt in bends of the river overgrown with cane, and shows great skill in catching his prey.

"Several years ago some ichthyologist maintained that the *hucho* is subject to a peculiar disease of the skin, of which he gave a description. This is, however, a mistake, as I have ascertained by consulting many of the fishermen of the Danube, and to my certain knowledge may occur in any fish, very frequently on the carp. It is a spongy excrescence, originating where the skin had been injured or the scales rubbed off, and of fungus origin, the same mould, viz., *Septomitrus clavatus*, which sometimes covers the eggs in breeding establishments, especially in winter time, especially when dead animal matter had been allowed to contaminate the water.

"The mode of catching the *hucho* differs greatly along the extended banks of the Danube, and is influenced by the situation, depth, etc., of the river. In summer time they are taken in nets, and smaller ones, up to six pounds, with the fly, which, however, is refused by the older fish. From October to their spawning time, even during the coldest winter, and under the ice, they are also to be taken with minnow bait on ground hooks. No other fish of the Danube, beside the pike, will take the hook.

"No fish of the salmon tribe, the true salmon, *Salmo salar* not excepted, affords more sport to the angler than the *hucho*, especially before the river becomes covered with ice, or when it breaks up in spring, and none takes the hook at this season more readily, whether small or large, from one pound up to sixty. In rapids or other places, provided they are free from ice, the fishing is always successful. I have frequently practiced this mode of fishing in the Danube, from Linz to Galatz, and in its tributaries, Lech, Inn, Salzach, Theiss, Drave, Save, Marosz, even in the severe winter of 1852, and always to my satisfaction.

"I am entirely satisfied that the *S. hucho* will be admirably adapted for the Mississippi River and its numerous tributaries. The large, deep indentations, overgrown with cane, as well as the numerous rapid mountain affluents, offer favorable abodes. The large lakes of the United States appear also to be equally appropriate for this fish. This, of course, is nothing more than my individual opinion, but that its acclimation is possible is beyond doubt.

"For the introduction of this fish two ways seem to be indicated.—First, the direct importation of a number of live fishes, about one year old, to be nursed in a suitable small lake until mature for propagation; or, second, the importation of a large number of impregnated eggs to be artificially hatched. The former has great difficulties, as the *hucho*, like all salmon, constantly requires fresh water; still I should be willing to try it with about twenty-five to fifty specimens of the age of six to twelve months. It would, however, take almost three years before the fishes would be fit for propagation, and this is a great loss of time. The latter method offers no less difficulties, viz., the collection and transportation of the eggs, which are very sensitive, especially as the temperature of the season is rapidly increasing, when they are spawning. It is scarcely credible that their artificial impregnation is entirely unknown to the fishermen of the Danube, although they believe it possible with the trout.

"It would therefore be necessary to engage the most intelligent of the fishermen; to instruct them, and if they are willing to do the collecting to assign a centrally situated place, where the hatching can be carried to the first stage, viz., the development of the eyes. Immediately after the impregnation eggs would not endure transportation for more than two days.

"I have consulted several fishermen of the Danube, in person as well as by letter, and believe I could obtain 600,000 to 700,000 eggs in the first year. This is a considerable quantity, under these circumstances. The eggs are very sensitive, and will need to be managed by an expert; as the fishermen are entirely ignorant, and even require to be informed the mode of packing, etc. Hünigen, in 1872, secured 10,000 eggs, for which a man was sent to the Bavarian Danube. Mr. Shuster also received about 2,000, which were hatched. Those at Hünigen perished. It was the first time Messrs. Shuster and Haack had tried the hatching of *hucho*. In Germany preference is given to the salmon over the *hucho*, and even over the salmon of the Elbe, though the latter is the same fish. I believe, however, that the *hucho* will improve in the Rhine, as does every other fish, though it is already a splendid table fish, and desirable not alone on account of size. In reference to the difficulties of transportation, I need not direct your attention to the fact that they become so much greater in a journey to America. But as I reported in one of my last letters to Washington, I hope to meet all these difficulties

by the adoption of a little apparatus, by means of which I may safely carry 400,000 to 500,000 eggs. I think I have overcome the difficulties of construction. Ice for cooling, as you suggested, will be applied without allowing the direct contact of the eggs with the melting water. Of this apparatus I hope to exhibit drawings and models in America when I see you. In conclusion, I have to say that it will be necessary for the fishermen to ask permission for the collection of eggs, which, however, could be readily obtained.

"I believe that now I have told you all, the good and bad, of this fish; it is, however, far from my purpose to unconditionally recommend its introduction into your country. I believe the *Salmo salar* ought to be tried in the Mississippi at the same time, as the Gulf of Mexico would afford rich feeding ground. The Ohio and Missouri, with their many tributaries, may also be found suitable.

"P. S.—Of late years there is, everywhere in Europe, manifested the desire to destroy the pike in lakes and ponds. Although our laws are quite stringent, and are strictly executed, the catching of *Esox* is allowed even in spawning time, as rational fish breeding has proved them injurious. *Salmo hucho* and the other *Salmonidae* are protected by law during the spawning season.

"I consider the *omul* or *Salmo omul* of Baikal Lake as one of the most excellent of the *Salmonidae*. It is, however, at present scarcely to be had in Europe. According to my information, it surpasses the salmon of the Rhine in quality, and is extremely prolific. About 20,000 hundred weight are said to be caught in the lake, and preserved by smoking, every year. *Salmo omul*, as far as I know, has never been described satisfactorily in any work of natural history.

"Very respectfully, yours,

"RUDOLPHE HESSEL."

—The main features of the oyster bill, which has been agreed upon by the members of the General Assembly of Virginia, representing oyster producing districts, are contained in the following synopsis:

1st. Capital invested in planted oysters to be taxed at fifty cents on the hundred dollars, as other species of property—this tax to be collected by township collectors.

2d. Tax of fifty cents on the hundred dollars' value of oysters taken by tong-men.

3d. Licensed dredgers permitted to take oysters in the Chesapeake Bay, and Tangier and Pocomoke sounds, with \$3 tax per ton, with certain restrictions.

4th. Captains and sailing masters of vessels (licensed) armed with police power to arrest and take before the nearest justice parties violating the law. Inspectors may appoint reliable tong-men armed with same power of arrest.

5th. The abolishment of the oyster navy, and sale of steamers.

6th. Taxes to be collected by inspectors appointed by the county judges.

Woodland, Lawn and Garden.

GRAPES IN CITY GARDENS.

IT is just as easy to cultivate the grape in small as well as large tracts of grounds. Our gardens can be made to yield a good, reliable crop of grapes nearly every year. Then, when every one is so ready to say of good grapes, "how good they are; how very fine," why not cultivate them within your own enclosure? Within the limits of every city yard will be found a space sufficient to grow, and grow well, from one to three vines, whose healthy, luscious fruit you may have for the picking. And then a vigorously growing, thrifty grape vine is delightful to look upon, especially if well trained to a good, firmly made trellis. Who that can cover with the deep green leaves of a fine Concord or Catawba grape, would look with complacency upon a red brick wall? No one who has ever tried it; that we can verify by numerous testimonials. One lady writes us:—"Mr. Wyman, I am greatly your debtor for information received from you in answer to how to grow a good Concord grape in my back yard. This grape, you know, was presented to me by a friend, and all my neighbors then said 'it will never grow; you can never get anything from it but leaves.' I followed your directions, as laid down, and my grape vine has borne me two crops of grapes—one of six and a half pounds, and the next year eleven pounds, and I am satisfied."

One fine, large, thrifty Concord grape, well cultivated, will give a yield the third year of six pounds of very fine fruit, and the fourth year this same vine will yield ten pounds, and thus increases, as the vine grows and does well, until you arrive at a weight of say twenty-five pounds. I do not limit even the first year's fruit so low as six pounds, but I do say you should not allow more than six pounds to mature on a three year old vine, at any rate.

Remove all the small, irregular, and misshapen bunches, and what you have remaining will tell you the story in full; and this story, having been learned from the vine itself, is far better than any other teacher. Again, if you know how to keep your grapes, which is as easily done as to raise them, you can pack your boxes full of these rich, luscious bunches as easily as you can make a jelly, and surely with one half the trouble. The way to do this is to know how to do it.

"What kind of grapes shall I plant?" asks a lady friend, at whose request this is written; "what do you recommend for a garden of forty feet by seventy?"

The kinds of grapes we recommend are those that have an established reputation for bearing, and good ripening qualities. In choosing your grapes, for whatever situation in which you design to place them, always have a regard to the quality of the fruit you desire from these vines. Although the Catawba and Isabella are both hardy and good

bearers, the fruit is not esteemed of the first quality, except under the best aspects and in certain localities. I have seen fine grapes produced from both these vines in city gardens, yet I do not recommend them as the best. The Diana, Delaware, and Rebecca grapes will grow well, and are all fine fruit, but in city gardens, although giving good crops, require much care. For city gardens, where from one to ten vines are to be grown, we prefer the Concord to any vine we have used.

Having decided upon the kind of vine you would plant, plant it at the proper time for planting. Remember one thing—a grape vine should never be planted in a wet soil. The ground should, if not dry of itself, be drained of all the surface moisture, and trenched about three feet deep, and with the soil thus prepared you will mix equal parts of bone dust (ground bone), wood ashes, lime, or broken bones, and two quarts of charcoal finely broken up. Incorporate this admixture thoroughly together, and plant your vines upon it in your border under your brick wall in your garden. If you can give the room, we ask for our grape vines a border eight feet wide if we can get it, and in no case less than four feet width can we tolerate for our border.

If you design to train these vines upon an upright trellis near the brick work they should be planted ten feet apart. If on posts, and trained around posts, eight will do, keeping the vines in both cases well and closely pruned. I have seen them only six feet apart, and cultivated often what is known as the English vineyard culture, and they did remarkably well.

As an unailing rule, plant your vines where they will receive all the sunshine they can get; they love it. Now that you have planted your vine, the next important consideration is the pruning. This is to be done by removing all the last year's, or old wood; the old wood is always to be cut away. Cut in the young vines to two or three eyes, until you can get two vigorous canes, of ten feet in length, and train, if you can, horizontally, say four feet from the ground. Every eye upon these canes will send upwards fine bearing branches. Cut in every other one of these upright branches every year. In this manner you can successfully grow a sufficient quantity of good table grapes, at least sufficient for the wants of a common city family. Is it not worth trying?

OLLIPOD QUILL.

ORCHARD WORK.

If you have ordered your trees and shrubs for early spring they may possibly become frozen on their transit from the nursery grounds to your home. If so, what will you do with them? Throw them away as a dead loss, and growl over them; blame the nurseryman and every one else but yourself, who are the only one to blame for ordering prematurely? Now, do not do any of these things; it is very foolish in the first place, quite unnecessary in the second, and thirdly, it will not bring to life your frozen trees or plants.

"What shall I do then?" This is what you shall do:—Try and be for once a philosopher, and set about the best remedy for this misfortune that can be had. And this remedy will be found in allowing the plants to remain in unbroken bundles, and then take the package at once to a cool cellar, or cover them thickly and compactly with straw or hay, so that they shall thaw only gradually. By no means hurry their thawing out. In this way you will save nearly all if not every one of your trees.

I once had a large number of pear trees, of quite large size, considerably frozen on a passage from New York, which I saved without injury by this process after they had been pronounced "good for nothing" by a number of sympathetic neighbors.

Never be in haste to throw away a plant or a tree because the same has become chilled or apparently withered and dried up. There is often life in them. Always hope for the best and act promptly, and you will find in it your reward. You should not plant out your trees until the ground becomes dry and mellow. You gain nothing by removing your trees from a comparatively cool atmosphere to a cooler or more windy one. Let the weather become tolerably warm, prepare your holes in the soil ready for the reception of your trees, and then plant them out.

If your trees come to you from the nursery in good condition (and your first care should be to examine them) you may "heel them in," unless you plant them at once. Dig a trench in "heeling in" of sufficient depth to completely cover all the roots of the trees when placed within, and thoroughly cover the same; they can thus remain three weeks uninjured.

You should cut your choice scions this month for grafting, and commence grafting as early as the first of April.

You can prune your grape vines this month, and as long as they are in a dormant state cut close all the old wood, and remember that no grapes grow upon the old or last year's wood. Turn the new wood back to two short eyes, all except your running canes.

You can now set out your choice grape cuttings. Cut them to two or three eyes each in a nicely prepared, well made bed. Have the upper eye just above the soil, and press it firmly about them, and mulch the bed. Currants and gooseberries may be set in the same manner.

OLLIPOD QUILL.

BROOKLYN, March 5, 1874.

EDITOR FOREST AND STREAM:—

Some of your lady readers might be pleased to learn that at this season of the year, cuttings from the cherry tree or apple tree will bud and blossom in the house, if the cut ends are kept in water for about a week or ten days. The water should be put on blood warm every day or two.

W. W. S.

A THIRTY ROSE BUSH.—A rosebush adorning a cottage in Santa Rosa, California, was planted in 1858, and is one of the Lamarque variety, the most beautiful of the white roses. Imagine an immense bouquet of white roses, twenty-five feet high, twenty-two feet across, beautifully rounded, with a blossoming surface of 400 square feet, with 4,000 full blown roses, and 20,000 buds.

Natural History.

PUGNACITY OF THE GREAT BLACK-BACKED GULL.

DURING the autumn and winter of 1873, and the present winter, my friend Mr. Montgomery and myself have made many successful hunting cruises along the Connecticut, Long Island, and Jersey coasts. Mr. M. follows shooting for the sport it affords, and I hunt as a sportsman and ornithological collector. We live aboard our yacht, "put in" at any convenient harbor, choose a site for our house, and drop our anchor. Sometimes we remain a week or ten days in one place, at others but a few hours, according to the wind, and the game qualities of our hunting grounds. When "running" from one hunting ground to another, we often add bluefish and "skip jacks" (bonito) to our larder, which at times are preferable to fowl. During our numerous trips we have made many captures of sea birds, and have established a "happy family." Our family is not always happy, particularly at meal times, and the gulls, crows and cats, often fight over a favorite cod's head or bone. When not feeding, they live in perfect harmony, and freely associate. Our family now consists of four brant (*Bernicla brenta*), four herring gulls, (*Larus argentatus*), one great black-backed gull (*L. marinus*), two kittiwake gulls, (*Rissa tridactyla*), one red-head (*Aythya Americana*), one greater black-head (*Fulix marila*), one red-breasted merganser (*Mergus serrator*), and several crows. The brants are our favorites, and their cur-r-r-r-unk,—cawnk, is often heard, and many of the urchins in our neighborhood try in vain to imitate them. The last member added to the family, was a large black-back gull, which was captured as follows: As we were returning from the Fire Islands one day, we sighted a small flock of gulls, to leeward, sitting on a bar. We were going before a two-reef breeze, with a stark sheet, and as it was blowing a "gale of wind," we knew they would have to rise to windward, so we tried to "run them down." When the flock raised, one of them was cut down, "wing tipped" at long range. We finally succeeding in coming along-side of it, although in so doing we "shipped" considerable water, when beating to windward. Our bird was caught and added to our "happy family." Unlike the herring gulls he would eat greedily the first day he was turned loose. One morning I threw some clams to him as he was walking about the yard, and as he was eating them a cat (nearly full-grown) attempted to join in the feast. The gull seized it by the neck with its powerful bill, and if it had not been molested, would probably have severely wounded, if not killed the cat. The next victim was a smart young man, who was going to "catch the gull and tame it." Having driven it into a corner, he attempted to seize it, but the gull got the first hold by the leg, and it hung on savagely until the unfortunate youth tried to seize it by the neck, but the enemy was a knowing one, and he immediately let go of the "tamer's" leg and grabbed him by the hand, driving the point of the upper mandible in the flesh, and making a wound that bled freely. The "tamer" retired from the field, and was received by his companions with roars of laughter. When sailing around Princess Bay last November, we sighted a wounded female old squaw, (*H. glacialis*). As we were "bearing down" on it, a large black-backed gull swooped down, and seized the duck, lifted it from the water, and carried it about twenty yards, before dropping it. I have been told by Simeon Cheney, an old and experienced hunter who lives on one of the numerous islands in the Bay of Fundy, that the "saddle-backed" or "farmer gulls" (*L. marinus*), will kill and devour a wounded "sea duck" (*Somateria mollissima*), and that they often feed on dead birds found floating on the water. Our gull is evidently the "head of the family" and when any of the other members approach too near, he gives them such a savage look that they "take the hint" and scamper away out of his reach. The brant often crook their necks, and hiss spitefully at him, as they can easily outrun him, and make a safe retreat if necessary. When not disturbed, Mr. Black back is very quiet, and minds his own business. He is wise, and seems to know what is going on around him. He will perceive a fish in any one's hands at a distance, and always meets one half way to be fed. He has such a very wise look the boys call him "old-daddy," and bring him small fish from the beach, which are always thankfully received.

J. H. BATTY.

—In a lecture at New Haven last week, Prof. O. C. Marsh, the leader of the Yale Exploring Expedition, reported some recent discoveries of a very wonderful character. He stated that it had been ascertained that all the western region of the continent from the Gulf of Mexico to the Arctic regions was once a shallow sea, the Arctic regions being tropical in climate, and evidences of a burning atmosphere and prolific flora and fauna being apparent

on the whole line of this inland sea. Among the curiosities found by members of the expedition were the remains of sea serpents, sixty, seventy and eighty feet in length. These animals are very rare in other countries, but were formerly quite common in this country. Turtles five or six feet in length, but they did not have hard shells. Oysters have also been found three feet in diameter. In Kansas an immense reptile called a *Dinosaur* has been found, which walked on its hind legs. Its feet were like bird's, and it was probably similar to the animal which made the bird tracks of the Connecticut valley. *Pterodactyls*, or flying reptiles, also existed there, having a spread of wings of twenty-five feet, and able to carry away sheep or larger animals. The bones of birds about the size of pigeons and having teeth have been discovered in this region. They formed a link between birds and reptiles. One of the most wonderful animals found is the *Dinoceras*, which was about the size of an elephant but differing in many respects. It had three pairs of horns on its head, and a pair of tusks like those of a walrus. That these animals went in herds is evident from the fact that remains of a dozen of them have been found in one hundred yards. The remains of an animal about the size of a fox, having a skeleton very similar to that of the horse, has been found. It is called the *Orchippus*, has five toes, but its foot bears resemblance to the foot of a horse, and it is perhaps the ancestor of the horse.

—As an item of scientific intelligence, the editor of *Silliman's Journal* publishes the following note on subterranean fishes in California: It appears that the agent of the California Petroleum Company, at St. Buenaventura, wanting water to supply the company's wharf at that point, determined to sink an artesian well on the sea-beach, not five feet from high water mark. At the depth of one hundred and forty-six feet a strong flow of water was obtained which spouted to the height of thirty feet. Soon after the attention of the agent, Mr. Bard, was directed to the fish with which the waste water from the well abounded, and which, on examination, proved to be young trout, "thousands of them being thrown out at every jet." They were all of the same size, about two inches in length, and were perfectly developed, the eyes being also perfect. As the temperature of the water, as it comes from the well, is 64° Fahr., the fish must have entered it but a brief time before their expulsion, since they could not have lived long in such high temperature, and yet the nearest surface stream was several miles distant.

HAVE WE A "QUAIL" OR "PARTRIDGE" AMONG US?

PHILADELPHIA, March 9, 1874.

EDITOR FOREST AND STREAM:—

Our two greatest sporting writers, William Henry Herbert and Dr. E. J. Lewis, differ entirely as regards the proper name for the *Oryx Virginiana* or American quail, one urging American quail as correct, and the other American partridge as best. Audubon and Wilson, in their accurate descriptions of the bird use the terms *ortyx* and *perdix*, and it is classified by and known to ornithologists as *Oryx Virginiana*, or American quail. I will quote both Herbert and Lewis in their arguments.

Lewis says: "It has been stated that the *Perdix Virginiana* is more closely allied to the European quail than to the English partridge, but such is not the fact, as the partridge of our country resembles the quail in no one particular save in the habit of partial emigration that it exhibits every autumn at the running season. The meat of the European quail is dark and oftentimes loaded with fat, while that of the partridge is white and invariably lean. It is a well known fact that our partridge is monogamous, while the quail is polygamous. Quail seldom form themselves into coveys; when they migrate they assemble together in large numbers, but as soon as they arrive at their destination they separate, each seeking his own food and guarding his own safety; they travel invariably at night. How widely different is all this from the habits of our bird! This being the case we trust the American sportsmen hereafter will give our partridge its proper appellation and rank, and no longer confound it with the quail, a bird far inferior whether in field or on the table."

Herbert writes: "The ornithological name of the partridge is *Perdix*; of the quail *Coturnix*; of the American bird, distinct from either, *Oryx*. The latter name being the Greek word, as *Coturnix* is the Latin word, meaning quail. It is of course impossible to talk about killing *ortyxes*, or more correctly *ortyxes*; we must, therefore perforce call these birds either quail or partridge. Now as both the European partridges are considerably more than double the size of the American bird, as they are never in any country migratory, and as they differ from the *ortyx* in not having the same woodland habits, in cry and in plumage, while in size, and in being a bird of passage, the European quail exactly resembles that of America, resembling in all other respects far more closely than the partridge proper. I cannot for a moment hesitate in saying that American quail is the correct and proper English name for the *Oryx Virginiana*, and I conceive that naturalists who first distinguished him from the quail with which he was originally classed, sanction the English nomenclature by giving him a scientific title, directly analogous to quail and not to partridge."

And thus do doctors disagree. May it not be from such arguments as I have just quoted that in the southern States our "Bob White" becomes the Partridge, and in the more northern and western States the Quail? While really there is neither partridge nor quail strictly speaking in America, the *Oryx Virginiana* being a link between them. Homo.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, }
NEW YORK, March 7, 1874.

Animals received at Central Park Menagerie for the week ending March 6, 1874:

One Virginia Deer, *Capreolus Virginianus*. Presented by Mrs. Sarah M. Mallory.

One Herring Gull, *Larus argentatus*. Received in exchange.

One Duck Hawk, *Falco anatum*. Received in exchange.

One Horned Owl, *Bubo Virginianus*. From Lafayette, N. Y.: donor not known.

THE INTERNATIONAL FIELD TRIALS.

A LETTER FROM THE SON OF "IDSTONE," OF THE LONDON "FIELD."

FAVERHAM, KENT, Feb. 24, 1874.

EDITOR FOREST AND STREAM.—

It gives me great pleasure always to give a brother sportsman any information in my power, and I regret that I have but little time at my disposal to answer your interesting letter.

I do not think that an international match will be of much use till we have the same rules in force on either side of the Atlantic.

You are most probably aware that in a field trial here the awards are given on a principle based on the distribution of certain points, making in the maximum the amount of 100, a total rarely won by any dog. The scale of points you doubtless have by you. The judges generally give them as follows: Nose, 30; Pace and Style of Hunting, 20; Breaking, (as shown in working to hand and dropping to shot wing and fur,) 20; Pointing, (style and steadiness in,) 15; Backing, (i. e., dropping or standing still on the point when the other dog has found the birds,) 10; Drawing on game or roading, 5; total, 100. Belle, (Mr. Price's) got out of these points 27, 33, 20, 15, 10, 5; 97, or in other words, the judges (Mr. Shirley, M. P. P.; Mr. W. Lort, and Mr. J. H. Walsh, Editor of the London *Field*.) thought her absolutely perfect except in nose. It must be borne in mind that the scent was not good, and her pace is the fastest in England for a pointer, so that she was more likely to put up birds than a slow dog with a good nose.

Field trials have existed since 1865 in England. There is a certain number of entries. In the best stake at Bala £25 was the entrance fee, and the first prize therefor was considerable in value. The dogs either run in braces or as single dogs; in the former case the braces are tried a brace at a time, the two dogs of course belonging to the same owner; and with the single entries two dogs are put down at a time before the judges. The order of running and arrangement of competitors being drawn for and decided by lot. It is not usual, as in coursing meetings, to run off the dogs till only one is left, but only the dogs which have pleased the judges are tried again. This caused, however, some dispute at the Bala trials, as Mr. Llewellyn thought that his bitch "Countess" should have been tried with Belle, though this is against all precedent and was overruled.

Retrieving is an accomplishment which would interfere with the elaborate and scientific rules of breaking to which English sportsmen of the present day are accustomed. It might, and frequently does, answer with a man who does not go in for very highly broken dogs, and shoots over perhaps one at a time, but it often makes dogs unsteady and dull on ground scent, hunting with their heads low instead of lifting for the body scent. We always use retrievers for winged birds; retrieving is not a pointer's or setter's trade. They are seldom, if well bred, fond of water, soft mouthed, or have any natural aptitude for carrying.

I do not think a sea voyage would hurt a dog's scenting powers, if an interval were allowed them to recover from the "perils and dangers of the sea." If I can induce any of my friends to visit America with their dogs you may rest assured I will.

I am not secretary of the Kennel Club, but editor of their Stud Book, which is not yet out; when it is I will send you a copy. Mr. Shirley, M. P., of Ellington Park, Stratford-on-Avon, England, is the gentleman who I believe undertakes the duties of an honorary secretary.

FRANK C. PEARCE,
Editor Kennel Stud Book.

BELLING SETTERS.

MALAGA, March 2, 1874.

EDITOR FOREST AND STREAM:—

I notice in your review of "Sporting Matters from Abroad," in last week's issue, the following: "About belling our dogs, however, that is a novel point, &c., &c."

What I wish to say in this connection is, that I have used a medium sized sleigh bell on my old dog Dash for two years past, and find it very advantageous, especially in scrub oak bottoms (from three to five feet high), which abound in the lower counties of this State, and in which you lose sight of your dog frequently at ten paces. The tinkle of the bell is a sure guide as to the direction the dog has taken, and should you cease to hear it for any length of time, you may be quite sure your dog "has found." Wm. C. Hay, Esq. of Winslow, N. J., a thorough sportsman, who has owned some very fine dogs, both native and imported stock, belled a bitch that he shot over all last season, and two or three other gentlemen of my acquaintance, whose opinions on matters of this kind, and all matters connected with field sports are worth having, also bell their dogs when shooting in certain localities. Yours truly,

W. B. ROSENBAUM.

POINTER AND SETTER MATCH.

RHWILAS, BALA, NORTH WALES, February 24, 1874.

EDITOR FOREST AND STREAM:—

Allow me to correct one or two inaccuracies that have crept into my letters to you, printers' errors in fact.

The first I notice is in letter dated January 8; at present the sentence reads thus: "They organize every June a very large dog show at the Crystal Palace, with that held at Birmingham, which were the most successful and best arranged shows in existence." Now this reads as if the Kennel Club managed the show at Birmingham which is not the case, a large and influential committee in the hardware town manage their own show and do it well. The sentence should read thus: "They organize every June a very large dog show at the Crystal Palace, which with that held at Birmingham are the most successful and best arranged shows in existence." You are also in error when stating that the Kennel Club manage the show at Nottingham. That is entirely different management, and one that is not generally considered satisfactory. Field trials and the Crystal Palace dog shows are what the Kennel Club is most particularly interested in.

I really do not see any way to admitting the points for retrieving. It is doubtless a most useful accomplishment on your side of the Atlantic, but our dogs if trained to retrieve would be afterwards worthless for any competition in the home country. We have proper dogs for the purpose which are trained to follow at heel, and not to seek for the dead or wounded game until they receive the accustomed signal for so doing. Good retrievers are never led in leashes, as suggested in your journal. The only well known English dog that to my mind would have a chance in retrieving in a setter match is Mr. Barclay Fields' "Daisy," who showed great aptitude for that style of performance at the Ipswich Field trials in September last.

R. J. LLOYD PRICE.

SHOOTING, AND THE DOGS WE WANT AND DON'T WANT.

I CANNOT agree with "Leatherhead" as to the setter being the dog for covert. For partridge or other game in the open nothing can beat a well-broken setter or pointer, the former, perhaps, is most preferable, but this is merely a matter of opinion, and depends on the ground to be worked, etc. To take your setter into covert must be wretched work, poking about after him, especially if the underwood be very thick, where it would be next to impossible to follow a setter, as whilst you were extricating

your legs, etc., from the brambles, your dog would be lost to view, and if on his point you would be left hunting for your dog instead of your dog hunting for you. Of course some coverts might be practicable for the use of a setter, but even then it must be slow work. I should consider shooting very stupid were one to have all one's game pointed, the great excitement, in my eye, being not to know where the next fur or feather will turn up, and then to end its career with a good shot; but to see your dog standing in covert, and (if a good one) know that on your advance something will go out, keeping your eye on the spot, quite prepared, and killing whatever it may be, is what I term pot shooting, without any satisfaction. I also think another great pleasure in shooting is to have good dogs, and see them work, using the right dog in the right place. For rough shooting I agree with "Frank" that spaniels are the best and most useful—either good Sussex or cockers under proper command—to retrieve, being good for either fur or feather. Bassets and beagles are perfectly useless in covert. Once on fur, they are away with a merry noise, flushing all before them, generally hunting all of a lump; one might as well shout at a stone wall as at them to come in. Merely for rabbits, where paths are cut, a pack of good curs (say half a dozen) are very killing. For a man who has rough shooting, and can shoot, and perhaps cannot afford to keep his setters, pointers, spaniels, and terriers he will find a brace or so of spaniels, taking them all round, the most useful. For one who shoots for the pot, and cannot hit a hay stack if it got up, unless he were prepared, let him keep his setters. It seems to me the pleasure and aim of many sportsmen of the present day are to bring all they can to bag, and this is their boast.—*Bell's Life*.

—An officer at Fort Sill, Indian Territory, in writing to us, mentions an instance where a dog of his, whilst bringing in a bird, came to a point on another without dropping the first, which is certainly something quite unusual.

The Horse and the Course.

A NEW DRIVING PARK IN PHILADELPHIA.—A number of wealthy gentlemen of Philadelphia have associated with a view of establishing a Driving Park and Club House near the city. They are about purchasing a tract of land within a few miles of Fairmount Park. It consists of eighty acres, peculiarly adapted for the purpose intended, and when improved upon the scale marked out will be one of the most complete and magnificent Driving Parks in the world—certainly not equalled in this country. The situation is finely elevated with a remarkable breadth and beauty of scenery, overlooking Germantown and Chestnut Hill, with the Schuylkill and Hills of Manayunk in the near foreground. It is within fifteen minutes' drive from Fairmount Park by Turnpike and well ordered summer roads. The gentlemen of the association are of wealth and undoubted standing and intend to guard their club against all influences that tend to degrade the "Sports of the Turf."

—The Maryland Jockey Club have decided on the weights for the mile-heat handicap stakes for four-year-olds to be run for at the spring meeting on May 26th. John F. Chamberlin's Survivor has been honored with the top weight, 112 pounds; Joe Donahue's Artist comes next with 109 pounds, and W. H. Gordon's Jack of Trumps, and H. B. Blandy & Son's Fannie Boston, both handicapped at 95 pounds, bring up the rear of a string of eighteen.

—The Buffalo Trotting Association have arranged the following purses for the different classes:—For the 2:20 class, \$7,500; 2:24 class, \$6,000; 2:26 class, \$10,000; 2:21 class, \$10,000; 2:31 class, 4,000; 2:34 class, \$3,000; 2:38 class, \$3,000; 2:45 class, \$1,500, making a total of \$45,000; \$5,000 is to be reserved for special premiums, if thought advisable to offer them. All races are to be mile heats, best three in five, in harness.

—The spring race meeting of the Virginia Riding Club is announced to take place on the 26th of May at the grounds of the State Agricultural Society. The Scotland Farm Club will unite in the festivities.

WATERING HORSES JUST AFTER EATING.—At a recent meeting of the Formartine Agricultural Association of Scotland, Mr. Cassie, V. S., of New Machar, in a paper relating to this subject, truly stated that a full drink of water immediately after being fed should never be allowed to horses. When water is drunk by them, the bulk of it goes directly to the large intestines, and little of it is retained in their stomachs. In passing through them, however, the water carries considerable quantities of their contents to where it lodges in the intestines. If, then, the contents of horses' stomachs are washed out of them before they are digested, they are in a manner lost, no nourishment being derived from them. * * * As was well known, the horse had a very small stomach, and experiments had often been tried which went to prove what he had said. In Edinburgh, old horses had been fed with split peas, and then supplied with water immediately before being killed. It was found that the water had carried the peas from fifty to sixty feet into the intestines, where no digestion took place at all.

—Efforts are about to be made to establish a Fish Commission for Newfoundland, and it is almost certain that Michael Carroll, Esq., of Bonavista, through his scientific qualifications and the efforts of prominent officials, will receive the appointment of Commissioner. Prof. Baird of the Smithsonian Institution, has specially recommended him. The creation of a Fish Commission for that island would seem to be very desirable, not only because of its vital importance to the Newfoundlanders themselves, but co-operation for mutual benefit could thereby be more readily established between the maritime portions of the Atlantic coast of America.

FISH PONDS FOR SALE.—We refer our readers who are interested in aquaculture to the advertisement of "Imson Fish Farm," for sale, in this paper.

MEETING OF THE AMATEUR RIFLE CLUB.—In our last issue we gave the details of the correspondence between Colonel Wingate and Major Leech, with the programme, in regard to the international rifle match. At a recent meeting of the executive committee of the Amateur Rifle Association the following resolution was passed:—

"Resolved, That the programme, as at present proposed by Mr. Arthur B. Leech, is acceptable to the executive committee, with the exception of the first paragraph, which relates to the number of men of which the teams shall consist, and that it is the sense of this committee that this paragraph should be amended so as to read, 'that the teams shall consist of not more than eight nor less than six men.'"

Major Leech's programme limited the Irish team to no less than four or more than eight men. We appreciate fully the difficulty Major Leech may have in getting all his men to come over here, but at the same time the match would be of greater interest providing it was possible to increase the number of men from four to six. We sincerely trust the matter can be arranged. The Amateur Rifle Club, made up as it is of the best rifle shots in the United States, should of course take all prominence in this forthcoming match, and will select those riflemen who, in their opinion, are the most skillful from all parts of the United States, in order to compete with the crack marksmen of the world.

—On March 4th the *Germantown*, (Pa.) *Telegraph* entered upon its forty-fifth volume, and during all this period of publication, it has been under the editorial management of its present editor in chief. It is a most excellent paper for the general reader, and is made especially valuable to sportsmen through its appropriation of a department to the sports and sporting interests of Pennsylvania. May its success continue.

—The *Florida Press* states that \$200,000 have already been subscribed for the Jacksonville and St. Augustine railroad, and that the road will be built immediately. The old wooden railroad from Tocoi on the St. John's River, to St. Augustine, is represented as being in capital running order and furnished with new and elegant cars. It now makes the 16-mile trip in something less than two hours.

—Florida green peas and strawberries are now brought to our market by nearly every steamer from that genial climate.

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfit, implements, routes, distances, seasons, expenses, remedies, trails, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.]

W. H. P.—What would be the probable expense for a good setter pup say two or three months old. I want a native pup of good pedigree? \$30.

C. L. W.—Weston, Vt.—Where can I purchase a township map of New Brunswick? Ans. From J. & A. McMillan, St. Johns, N. B. Price \$2.

L. McINTOSH, Pittsburg.—No object whatever in oiling fishing rods. Some manufacturers oil the wood before the varnish is laid on. Well tied flies never come to pieces, and the gut lengths do not pull out.

J. P.—The *Fancier's Journal* of Philadelphia, the *Live Stock Journal* of Buffalo, and the *Agriculturist* of this city all devote much space to pigeons and domestic fowls of all kinds.

HARRY WHITE, Syracuse.—Can you inform me through the columns of your paper the prices of a Rob Roy & Baden Bowel canoe of the larger size, and oblige? Ans. Write to the Hon. Secretary of the Canoe Club, S. Roosevelt Schuyler, care of Messrs. Roosevelt, Maiden Lane, N. Y.

J. D., Baltimore.—I see that you allude to the *Andaman Islands* in your article speaking of "Men with Tails." Where exactly are these islands? Ans. The Andaman Islands lie in lat. 4 deg. to 10 deg. N. and long. 93 deg. East, in the Bay of Bengal, and are about 300 miles to the westward of the Malay Peninsula.

W. A.—Can you mention any stream in the vicinity of New York where good trout fishing can be had and the entire trip there and back made in 30 hours? Ans. The most accessible streams answering the conditions are on Long Island. Take South Side Railroad to Oyster Bay as soon after March 15th as possible. First comers after the season opens make good baskets.

R. K. A., Mount Vernon.—"Bismarck" is a strong, muscular dog, and works in the season all the time. As a general rule too much animal food is bad, except when the dog is in training for a hunt; then give him the day before a good meal of horse flesh if possible. Feed him but once a day, always after he has earned it. You can procure back numbers of *FOREST AND STREAM* at this office. See Dec. 4th, No. 16., "Food for Sporting dogs."

W. S. S.—Where in Philadelphia are the rubber inflated bay bird decoys to be obtained, manufacturer's name, price, &c. Ans. Rubber bay bird decoys cannot be had; were made formerly, but were found to crack in using. Inflated rubber decoy ducks can be bought at John Thornley's in Philadelphia. Improvements have been made in the ducks, so as to prevent cracking; but the bay birds have never been improved upon.

M. F. B., Phenixville, Pa.—Where can I get black bass for stocking a fish pond and for breeding. There are a great many bass here (in the Schuylkill), but it is against the law to catch them? Ans. Having received several inquiries after the eggs and live specimens of black bass for stocking ponds, we have endeavored to inform ourselves thoroughly on the matter by extended inquiries, and find that the fish are difficult to obtain, while we cannot learn that the eggs of black bass have ever been taken and artificially hatched, much less sold for hatching. State Fish Commissioners seldom sell or give anything away to private parties for stocking private ponds. We once obtained through J. A. B. Campbell, 433 Niagara street, Buffalo, some bass from Lake Erie for stocking a lake in Blooming Grove Park; by writing to him or to Henry Curtis, Willow Boat House, North Buffalo, N. Y., you may get some definite information. Fred Mather, Esq., of Honeoye Falls, N. Y., informs us that he intends stocking a pond with Erie bass, *micropterus nigricans*, this year, and propagating them for sale. 2. How can a stop be put to catching bass. There is a heavy fine, but no one wishes to make enemies by informing on them? Ans. The only practicable way to stop illegal fishing in a place where it is openly practiced, and where no one wishes to incur the displeasure of the law-breakers by enforcing the law, is to form a club, educate public opinion on this point, show the fishermen that their interests are at stake, and then give public notice that after a certain date all persons taking fish contrary to law will be prosecuted.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

103 FULTON STREET, NEW YORK,
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, MARCH 12, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

REMOVAL.

The office of FOREST AND STREAM will be removed early in April to the Iron Building, No. 17 Chatham Street, lately occupied by the *Staats Zeitung* newspaper, which we have leased for a period of years. This splendid location in Printing House Square we shall occupy jointly with our popular daily contemporary the *Evening Mail*.

TO ADVERTISERS.

AS spring advances, dealers in anglers' outfits note with satisfaction that a new impetus has been given to their business, and manufacturers of rods, flies, trolling tackle, tents, camp kits, rubber goods, corduroys, fishing boots, etc., find their orders begin to increase. Sportsmen are already casting about for new fishing localities, and are carefully studying the routes, distances, and fares. Even the prudent *pater familias*, who spends the summer months in rural resorts, is selecting the place for his sojourn, and occasional advertisements for country board already appear in the papers. It is obvious that now is the time for those to advertise who would reap the greatest amount of benefit from the popular demand; and we can safely and conscientiously assert that, with the present circulation and social status of the FOREST AND STREAM, no journal in the country is so directly and eminently adapted to meet the requirements of the parties designated who seek to be brought into communication with each other. Our mail subscribers we know to be of wealth, intelligence, good social position, and leisure, who can afford to spend liberally for their personal gratification, and are satisfied with no goods but the best, and it is reasonable to assume that those of our readers who are supplied by the newsdealers are likewise in great part of the same stamp. They are not a miscellaneous class, like those who support the daily newspaper or the literary journals, but each is, and must be, from the nature of his affiliations, a purchaser of those articles that he employs for his diversion. One copy of our paper will therefore accomplish as much for the advertiser as a score or more of those printed for the general reader, the great mass of whom are occupied with their avocation in their daily struggle for subsistence, and have no time or money for outdoor recreations and the gratification of natural tastes. We can if necessary produce unsolicited letters from some of our advertisers attesting to the value of this journal as an advertising medium, and expressing their

surprise that a journal so recently established should bring them so many and lucrative returns in the shape of orders for goods. The FOREST AND STREAM now reaches every State in the Union, and has subscribers in Canada, the West Indies, South America, France, England, and Germany.

But it is not to dealers in outfits alone—outfits for those who fish for profit as well as pleasure—that our paper is serviceable. Our sportsmen require maps, guide books, and time tables of the railway and steamboat routes that lead up to the wilderness resorts and fashionable watering places; and the hotels themselves should be indicated. We are answering requests every week for information that ought to be supplied in our advertising columns, and which is as necessary to the inquirers as proper advertisements of the same would be remunerative to those inserting them. The yachting and boating season is also at hand, and demands will presently be made for stores and new sailing and rowing crafts of all descriptions. Dealers in all kinds of implements for out-of-door games, dealers in horses and carriages, dealers in flowers, seeds, and garden tools, all can use our columns to advantage, for we have departments especially devoted to the interests of each. Pisciculturists can also be brought to the notice of those about to stock fish-ponds and streams, and, since much official and practical information relating to this growing and important branch of industry is now printed in this paper, increased attention will be attracted thereto. It is needless to specify farther, for those whose interests are involved in the subject-matter of this publication will doubtless see for themselves. That there will be large accessions to the ranks of sportsmen, tourists, and rural sojourners the coming season is evident, for fish have not only become much more abundant through the efforts made to propagate them, but the interest in natural objects is becoming widespread and general. We would therefore earnestly strive to impress upon all dealers in the various lines of goods referred to the advantages which we offer and the favorable opportunity of the present time, for never has a paper been published in this country before that caters or appeals so directly to their several interests.

THE INTERCOLLEGIATE REGATTA.

THE very general discussion that attended and has followed the selection of a course for the Intercollegiate Regatta indicates a wide spread and lively interest in the manly sport of rowing, and makes it clear that every effort to render it a high-toned as well as healthful pastime, will command the commendation and support of the better part of the community. Though not insensible to the weight of argument, *pro* and *con*, as respects Saratoga, our relations to students and public are such that we feel competent to take an impartial view of the case, and to judge of its merits dispassionately. As an alumnus we take a Collegian's pride and interest in the honorable emulation, prowess, and success of the students, while we also entertain a jealous regard for their welfare and good name everywhere. At the same time twenty years of absence from Alma Mater has toned down our enthusiasm and permits us to survey the question calmly and from a more practical standpoint than the participants themselves.

It seems to us that the mere choice of location—Saratoga or New London, Springfield or Winnipissiogee—does not enter into the merits of the case at all, and that much ink and good temper has been wasted in the controversy. We have no fear of the morals of collegians being damaged more at Saratoga than at any other place. The evil disposed can serve the devil in country as well as in town; and so far as diversions are concerned, we believe that evil accessories are more scattered at Saratoga than condensed, and that the great weight of respectability included in the summer population of Saratoga, and the critical eyes of the spectators, friends and relatives at the exhibition, would have their restraining influences upon the conduct of the students and command their dignity, circumspection, and self respect. As to bad men and demoralizing temptations, they are inseparable from great public contests of this kind; and it is just here that the real and true issue reveals itself. The question is—with all the time, study, attention, and extraneous connections and associations that are necessary to make the intercollegiate contests an honorable success—whether they are not prejudicial to the morals, scholarship, and future eminence and usefulness of students? indeed, whether these grand annual regattas should be held at all? The opinion of the College Faculties is divided upon this point. If our readers will refer to the issue of FOREST AND STREAM for August 14th, 1873, they will see that we raised this question then, and went so far as to obtain a categorical answer from Prof. Hitchcock of Amherst, which is published in the same number of the paper. The answer was more liberal than we anticipated, though it would fail to meet as fully now, as then, the changed conditions caused by the enlargement of the Rowing Association by the admission of Cornell and Princeton.

Boating practice was first engaged in merely as a pastime and means of physical culture, and we believe we were present at the launch from Brooks & Thatcher's boat house in New Haven of the first college barge that was placed upon any waters in this country. This was in the summer of 1850. Other Yale clubs were formed and other boats were built, and then came friendly rivalry and mile and half-mile dashes for victory. Directly other colleges created navies, and in 1852, on Lake Winnipissiogee, in a barge race between Yale and Harvard, intercollegiate racing

had its origin. The spirit of rivalry was nurtured and strengthened in the subsequent Worcester regattas, and developed into full vigor and importance when the National Association was formed in 1871. The formation of this association was a necessary step and a natural consequence. Racing will always be popular, so long as the sight of intense action on the part of man or beast excites our interest and awakens our enthusiasm. Boat racing, in itself considered, has especial attractions for men of natural and healthy tastes, for it brings into play those three cardinal virtues—courage, skill and endurance; but college racing has a charm peculiarly its own for those who refuse to interest or concern themselves in the contests of professionals. The intercollegiate race is a friendly, generous struggle between contestants representing the best elements of society, in whom, as collegians, a peculiar interest is felt. They engage in it as a diversion, not as a business. They are actuated, not by mercenary motives, but by a generous rivalry, and are incited by that *esprit de corps*, which is so marked a feature of college life, to strive zealously for honors which shall redound to the glory of Alma Mater. The throngs which darkened the shores of Lake Quinsigamond and lined the river's edge at Springfield were composed of the *élite* of New York and Boston and the smaller New England cities, and gathered, for the most part, either because they felt a personal interest in the young gentlemen who composed the crews, or because they were friends and partisans of the colleges represented by them. The victory of the "Aggies," at Ingleside, in '71, and the time made by the Amherst boys at Springfield, unprecedented then and now, served to attract a wider interest than had been manifested in the Yale-Harvard duel. And so it has resulted that the few interested spectators that formerly gathered to witness the occasional practice sports of college crews in leisure intervals of study, have grown into an aggregation of vast multitudes, and the Intercollegiate Regatta has come to be regarded as one of the great annual events. It is entirely beyond possibility to prevent these contests from attracting general attention, or to exclude the attendance of the promiscuous public, however disreputable or contaminating its components may be. We cannot exclude bad characters from theatres, and even in churches pickpockets often find a most successful field of operation. It is quite certain that the employment of professional trainers by college crews, and the occurrence of matches between professionals during regatta week on the same water as that rowed over by the collegians, has served to attract "sports and gamblers" to the races; but how can these results be evaded? How could they have been avoided? College regattas were not instituted as public exhibitions merely to attract great crowds. The crowds are the natural consequence of the excellence of the contests and of the appreciation of the material that enters into their composition; and just so long as worldwide interest and *éclat* attracts thereto, so long must these objectionable features be endured. If morals are in danger, the only way to save the morals is to abolish the regatta altogether, or, at all events, by destroying its integral character, to divide the interest that attaches to it. Already the National Rowing Association has become a ponderous affair, and were it to embrace all the colleges of the United States, we could readily imagine that a universal holiday might be the result—that college discipline would be impaired, and that the studies of the curriculum would take secondary place to athletic exercises and training. The fact of a separate New England organization being desired, or even suggested, and the reluctance to admit Princeton and Cornell into the National Association, shows that it is fast becoming unwieldy and too comprehensive; and we believe it a safe prediction that, under the present feeling and views of the Faculties of Colleges, there will be no more Intercollegiate Regattas, as such, after the meeting at Saratoga. In another column, we copy from the Middletown College *Argus* a description of the Saratoga course and a survey of its advantages.

POSSIBLE CHANGE IN THE TARGET SYSTEM AT WIMBLEDON.

WE take particular note of the remarks made in a late number of the *Volunteer Service Gazette* in regard to certain proposed changes in the English target system as used at rifle ranges. Where so much skill is evinced by the leading English riflemen, (and they may be counted by the score) the exact average of individual excellence may sometimes be lost, or difficult to determine where the present system of employing the square target, with its coarser divisions of bulls eyes, centres, and outers are to be considered a permanent fixture.

The present method of counting was, however, exceedingly well devised. It was intended to give heart to the rifle-man, so that all possible hits should score something, and that approximate skill should be encouraged. As a general school for soldiers, it is still we think the best, but for very skillful riflemen, it has undoubtedly its defects. Perhaps the originators of the system never thought that at such long ranges, 1,000 and 1,100 yards men would hit bulls eyes time after time in succession. They did not imagine that rifles would be so wonderfully improved, and that human skill in marksmanship could accomplish such difficulties. The nuisance of ties is certainly making itself felt at Wimbledon every year, and the patience of the men awaiting the decision of an important event is often sorely taxed. We give below some of the arguments used by the *Volunteer Service Gazette*, looking towards such a change. As for ourselves we are satisfied with things as they are now at Creedmoor. When in some five or six years to come

we have become more expert in the United States with our weapons, we shall be glad to follow any improvements made at Wimbledon, if we do not invent something of our own, so that the delicate shadings of the rifle experts may be more nicely recorded:

"It is no exaggeration to say that the conditions of rifle shooting of the high class alone seen at Wimbledon, ought to be as different from those which obtained a dozen years ago, as the latter would have differed from matches with Brown Bess. In theory, all "coaching," all advice, even all "marking," ought to be abandoned. The *Volunteer*, fully equipped for the field, ought to be placed in front of his target, with no adventitious aid and with nothing except his own observation to tell him where he had hit, or whether he had hit at all. And of course, of two equal scores, that ought to be counted the best which is made in the shortest time. Equally, of course, in theory the marksman ought to have to judge his distance from the target for himself. The target itself ought, as Mr. Hemming conclusively showed years ago, to be so large as to take in all moderately good shots, and to be divided into a considerable number of concentric circles. We take it for granted that some improvement will be made in the old-fashioned and imperfect targets now in use, and that, if only in view of the monstrous absurdity of the strings of ties which have troubled all Wimbledon marksmen for many years, either an attempt will be made to subdivide the targets, if pasteboard targets with concentric rings cannot be used, or that at any rate the sizes of the targets will be diminished. Ties, as we have often pointed out, merely mean that the scoring is too rough, and all the devices which have been adopted for deciding them are not only wrong in principle, but most unsatisfactory in practice. We have very little doubt that with smaller targets, or targets with more divisions, with the seclusion of the competitors and the disuse of private telescopes, the difficulty of ties would be got rid of, for the present at least, to a very great extent."

A PLEASANT YACHT TRIP.

ANY owner of a yacht, at a loss to select the proper "end and aim" for a summer trip, would do well just this year to try Iceland. The run from New York or Boston ought not to be a very long one, and the far northern island, as is well known, is singularly rich in natural and historical objects of interest. The English yachtmen, for many years, have appropriated this field to themselves, and not a few craft flying the flag of the Royal Yacht Club find their way every summer to the land of the Sagas and the Geysers. Lord Dufferin's "Letters from High Latitudes," and more than one other recent work, bearing some such title as "A Yacht Voyage to Iceland," bear witness to the favor in which this region is held by British yachtmen. But it happens that the Icelanders will this summer celebrate at once the thousandth anniversary of their existence as a nation, and the re-establishment of their independence. It was in 874 that the settlement of the island began, and it is in 1874—this winter—that the Danes have been forced to grant the free-minded islanders a constitution, which fully recognizes their right to govern themselves. The festivities consequent upon these two events will be worth witnessing. A trip thither ought to be so planned as to afford time for a fortnight's stay at Reykjavik, the capital, which would amply suffice for excursions to the sulphur mines, Hecla, the Geysers, the eider duck establishments at Videy, and the wonderful plain of the Althing. This ought to be followed by a sail around the island, touching at one or two points situated upon the most beautiful of the great fjords. The country affords the best of trout, salmon, and other fishing, and abounds in feathered game—some parts of it, such as the central portion around the lake of Myvatn, being nothing less than natural aviaries on a magnificent scale. Let us hope that some daring American yachtsman will soon carry the stars and stripes to the Icelandic sea.

A SNOW SHOE TRAMP.

SNOW-SHOEING is a favorite pastime in Canada, and Snow-shoe Clubs composed of both ladies and gentlemen, are common. The Canadian snow-shoe or raquette is an elliptical hickory frame some three feet in length by twelve inches wide, rounded at the toe and pointed at the heel, and crossed with a net work of buckskin thongs. A cross bar, one third its length from the toe, strengthens the shoe and supports the foot of the wearer, whose toe is thrust under a deer skin strap, as if into a stirrup, securing it firmly in position. The heel is prevented from slipping out of the stirrup by a strap which passes around the heel. These shoes are used in deep soft snows into which the traveller would sink without them, and it will be readily perceived what an advantage they give the hunter by enabling him to pass with comparative ease over the surface, while the animal he pursues is obliged to flounder through leg deep. They are also convenient and oftentimes indispensable to the inhabitants in the ordinary course of travel and traffic; without them locomotion would be impossible where the snow lies several feet deep. In walking the traveller shuffles along with something of the lateral movement or side step of the skater, but with a sort of jerking lobe which can scarcely be described, and is only acquired by practice. Nor is the process by any means easy, especially when the snow being light and feathery, the shoe picks up a big shovelful on the toe at every step. [And if a novice should happen to lose his equilibrium and fall, getting up is no joke except to bystanders, for at each attempt to raise himself, the victim thrusts his arms to the elbows into the yielding snow, and being without any means of support whatever, is unable to rise except by a helping hand.

On occasions when the clubs are out for a day's sport, the ludicrous mishaps that occur to both ladies and gentle-

men give rise to continuous merriment, and no doubt constitute one of the chief charms of the pastime. To see a fur-coated and muffled gallant floundering in the frosty element with his feet higher than his head, and looking as though he had been floured and cottoned, presents one of the most comic of aspects; and there seems a general disposition on the part of the more fortunate to let him flounder until they have laughed their sides sore and the tears have formed in icicles down their cheeks. If ladies fall, a dozen of course come to the rescue at once, and the picking up and shaking out from wrists and neck and ears becomes an earnest and assiduous duty, to which the tenderness of the beaux and the reddening cheeks of the damsel add a feature most striking. Experts, however, find little difficulty in recovering their perpendicular status in case of mishap, and many a mile of snow-shoe travel over mountains and through forest is performed by the hardy Canadian whose necessity or vocation calls him to wilderness journeyings.

Snow-shoeing is one of those experiences of life which being necessary, are made the most of, and so, as we have said, the Canadians have many a merry tramp in lieu of a sleigh-ride, and the belles of Montreal and Quebec think nothing of a dash of a dozen miles out into the adjacent country to some favorite hostelry, where hot punch and a blazing of the fire awaits their arrival.

We had in mind to recall some experiences of our own, indeed we had applied to that vigorous descriptive writer, Le Moine, of the "Maple Leaves," to send us a sketch, when fortunately we discovered in the *Montreal Gazette*, a brief account of a tramp, not portrayed exactly in the glowing colors we should wish, but nevertheless interesting in its novelty to those of warmer climes, and herewith we give it just as we found it:—

"Evergreen Hughes has perpetuated in rhyme the reminiscence of an attempt made in the early history of the Montreal Snow-Shoe Club, by a number of the 'fathers,' to reach St. Vincent de Paul, a village on Isle Jesus, about twelve miles from Montreal, and how, owing to various circumstances, they

"Went fifteen miles astray."

The present generation determined to remove this reproach, and last Saturday morning a telegram was sent to the jolly young landlord of the Ottawa Hotel, Mr. Truteau, to "expect the Club in time for tea." At 3 o'clock a fair muster of the "Tuque Bleu" started from the Gymnasium, headed for Durocher street, and, after crossing the country a few miles, struck a bee line for their destination.

With good understandings well secured, and that fine *esprit de corps* which has always characterized the tramps of the *Alma Mater* club, the tassels of the blue tuques dangled on, and the long, quiet pace kept up, until the hearty "whoop" and wild yell of the start subsided into the quietness of steady work. The wind blew keen and biting, and soon transformed whiskers and hair into fantastic ice pendants that would have taken the breath away from a barber and defied the keenest air to remove. With such "lung protectors" covering their mouths, and perspiration from every pore, with the usual varying incidents and laughable accidents, keeping fences or rolling over them in a lump, moulding a nose occasionally in the "beautiful snow," or coquetting with the bump of inhabiteness in a deceitful drift, through bushes and over brush, up hill and down vale, scoring ready-made tracks of human feet or sleigh, keeping time with the leader, in regular Indian file, they reached the top of a hill on the Island of Montreal, a hill about on a level with the high-lands of Isle Jesus, and there before them, as some one graphically observed, "lay the promised land." The bright spires of the church of St. Vincent de Paul, the long line of the village, the Ottawa River frozen, the panorama that opened up on every side giving a bird's eye view of from ten to twenty miles, evoked a lusty cheer that scared some half-grown habitants into dwarfdom for ever, and whose echoes rang through the valley. A steady run, a strong tramp across the frozen river, a bit of a pull up hill, and with a boisterous shout, they soon hove in sight of the Ottawa Hotel, where mine host stood to welcome them with the sight of his own jovial face, and the flutter of a Union Jack hoisted for the occasion. Of course, our cynical citizen will sneer and call this "Utopian," and possibly may verge on the profane, or perhaps take a middle course and call it "bosh." Let him drive out—if not walk—just once, and be in at the entree of the club, and if he can ever raise a sneeze again, we give him up.

The tramp occupied about two hours and a quarter, though, of course, fast time is never aimed at on these tramps.

OUR OCHECHOBEE EXPEDITION.

SINCE the letter of our correspondent of 11th February was printed in last issue of *FOREST AND STREAM*, we have received the following note from headquarters at St. Lucie:—

"ST. LUCIE, BREVARD CO., FLA.,
February 18th, 1874."

CHAS. HALLOCK, Esq., *Dear Sir:*—Our mutual friend, Fred. Ober, left this point for Lake Ochechobee last Saturday morning, February 14th, in good spirits and with excellent company, a party from the north having arrived here a few days previous and joining his party. This party consisted of Prof. Jenks, of Brown University, Providence, R. I.; a Dr. Palmer, I think, from Ohio, and two young students on a collecting tour. There is also a gent from New York who has been quite a traveler, and whose experience will be of great advantage to the party. If Mr. Ober has an opportunity he will send you a note from out near the Lake, which I will forward.

Yours respectfully, A. D. TROWT."

The same letter speaks favorably of the fitness and capability of the boat which the expedition is hauling through the woods and jungles, and which it expects soon to launch on the broad expanse of Ochechobee. We have received maps of the whole coast from the Halifax River to south of Jupiter Inlet, a distance of some 160 miles; besides this, we are notified that valuable information bearing upon the early history of the country has been collected, with fifteen

photographic views of places on the river, and groups of Indians. The camera goes on to Ochechobee with the boat, and if the expedition succeeds, the *FOREST AND STREAM* will be able to give its readers the first views ever taken of this mysterious and undiscovered country. This enterprise is regarded with great interest all over Florida, and independent parties are essaying to reach the lake from various points. Prof. Jenks is a valuable acquisition to the expedition, as he has promised full information relative to any fish, plant, bird, or animal he may procure. Upon these conditions alone was he permitted to accompany our correspondent. We shall look for a second letter with interest, for the information sought is not only of the highest value to science, but the journey is not unattended with danger.

MOCCASINS.—Since our first mention of caribou-hide moccasins for sportsmen, we have had many letters of inquiry where to procure them, and also the hides themselves. We have used endeavors to interest manufacturers here and in Canada to undertake to supply the demand for them, which would be large if such were offered, but find that moccasins or shoe-packs of caribou hide are a scarce article, as well as the hides. We learn, however, from an old hunter at Belleville, Ontario, that the Canadians are manufacturing an improved kind of beef-skin moccasins or shoe-packs, which have good stout legs that reach to the knees. They combine much comfort with extreme durability, and with care can be made quite impervious to water. On purchasing a pair, the first requisite is to steep them in brine well up the legs for about twelve hours. This will keep them soft, and prevent their ever frosting on the feet. After steeping them in brine, hang them up to dry, rub them with neatsfoot or tanner's oil, and repeat each time after use, before putting them away. After wearing them one season it is important to have a light, broad sole and heel put on, and shaped over a large last. If these directions are followed the sportsman will have a perfect fishing and shooting boot, very light and easy to walk in. The best shoe-packs will cost seven dollars in Canada, and if those of our correspondents who have signified a desire to obtain them will send us their names, to the number of a dozen, we will send to Canada and purchase a case and distribute them by express to all applicants, express charges to be included.

MEETING OF THE NEW YORK ASSOCIATION FOR THE PROTECTION OF GAME.—The usual monthly meeting of the New York Association for the Protection of Game was held last night, at the residence of Royal Phelps, Esq., President of the club, No. 22 East Sixteenth street, Mr. D. H. Haight, at whose residence the meeting was to have taken place, being indisposed. There was a large attendance of visitors, and among the invited guests were Recorder Hackett and Mr. Charles Hallock, of *FOREST AND STREAM*. The President gave an interesting account of the operations of the Association since the previous meeting, and the disbursements which had been made for the payment of detectives, lawyers, and others. There were seven suits now pending, and the Association had just commenced another against an extensive dealer in Fulton Market who had once before been sued and who was again found to have violated the law. He alluded to the fact that the season for partridge, quail, and prairie chicken had closed on the 1st of March, and stated that the strongest evidence of the success of the labors of the Association in protecting and preserving game was the fact that not one of these birds could now be found exposed for sale in the City of New York. This was a very satisfactory state of affairs, and spoke volumes for the change which had been effected in the tastes of the community through the labors of the Association. The President also stated that he was glad to announce to the sportsmen present that the season for trout would open on the 15th inst. Mr. Hallock, of *FOREST AND STREAM*, was invited to address the meeting, and called the attention of the members to an original plan of his own, for the more efficient preservation of game throughout the United States, the adoption of which, he claimed, would tend naturally to the accomplishment of that much desired object. The project of Mr. Hallock met with much favor from the members, and was referred to a committee. After some remarks on the same subject from Hon. R. B. Roosevelt, the meeting adjourned. The supper rooms were then thrown open, and after partaking of the delicacies which had been provided by Mr. Phelps, the guests enjoyed themselves until a late hour after the fashion peculiar to the members of the association.—*N. Y. Times*.

—We learn that the Smithsonian Institution at Washington has arranged with Michael Carroll, Esq., the Newfoundland naturalist, to furnish a complete collection of the great variety of seal peculiar to Newfoundland waters—the ranger, jar, hood, doter, bedlamer, harp, blue, square flipper, harbor seal, etc., and that a room will be specially assigned to the same. This collection will include specimens of both sexes and all ages, from whelps to adults, and will be quite unique in its character, and of the greatest scientific and economic interest. In this way material will be brought together for an exhaustive work on seals. It seems that there are now no specimens of Newfoundland seals in the Smithsonian. The Institution is now engaged in gathering a similar collection from the Pacific coast, from which region it has already secured a large number.

—Sixty thousand shad were shipped from Portsmouth, Virginia, Saturday, for the New York and Boston markets.

CO-OPERATIVE GAME LAWS.

HEREWITH is given a comparative table of Close Seasons for all kinds of Game and Fish in each State of the Union where protective laws exist, so that the reader can determine at a glance, without the trouble of hunting through volumes of codified laws, just what particular bird, animal, or fish is excepted, or prohibited from being caught or killed, at any given month in the year. Its usefulness and labor-saving character are apparent. He who examines carefully, however, cannot fail to see how strangely the laws conflict as respects the game of any given latitude, even in States that are contiguous and homogeneous in their flora and fauna. The times and seasons often vary several weeks in localities that lie within the same geographical zone and between the same parallels of latitude. It is apparent at once what opportunity is thus given to those who desire to evade the laws, either in the killing or selling of game, while to the well disposed and most earnest advocates of protection the jumble of heterogeneous and interminable legislation renders it almost impossible to keep in mind, or even determine, when and where any particular kind of game is in season or out of season. More than this, within the general law of individual States are hundreds of special provisions, excepting this pond and that stream, and this county and that township, so that there are prohibited districts, and close seasons within close seasons, that render the confusion worse confounded, and defeat the efforts of those who seek the general welfare. And at each session of every Legislature some well meaning and enthusiastic advocate of protection clamors for additional and more stringent measures, so that in the midst of too much legislation and too much protection we are likely to defeat the ends we strive for.

It is obvious that the only remedy lies in co-operative legislation, and in a simplified code. Nature has singularly defined her geographical belts, and designated the animal and organic life that dwells within them. As certainly are the boundaries of the range of the deer and the habitat of the trout defined as are the varieties of food upon which they feed. *Cervus Virginianus* is not found north of a certain latitude, nor the *Salmo fontinalis* south of a certain latitude. The same is true of the ruffed and pinnated grouse, the quail, the turkey, the moose, and the antelope. What we need is one general enactment, that shall apply to each of these geographical zones alike throughout its breadth and extent, or at least to extended sections of these zones. Game laws for Ohio need not be the same as for Maine, but the laws protecting game in Maine, Vermont, and New Hampshire should be precisely alike, as the laws for Ohio, Kentucky, and Illinois should be the same for those particular States. To the Pacific coast the law of the Atlantic would not apply, for the climates and seasons are different. Local laws would have to be made for the moose and the big horn sheep, for their range is limited and fixed. For the nomadic buffalo, which ranges through many degrees of latitude, and whose periods of coming and going are as regular and well known as the rotation of the planets, special and peculiar legislation is required. Nevertheless, the general principle, as indicated, can be easily applied. Under these provisions there would be no need of local or neighborhood laws, for the game being thoroughly protected throughout the whole State, the depleted and barren districts of that State would in time be replenished and restocked. Different laws for contiguous States are irrational, and as at present constituted they are actually aiding to drive out and exterminate the game instead of preserving it. If September is a close season in one State, and October in the next adjoining, no end of trouble must result; witness the case of the governor of Missouri, who, when shooting near the border, happened to cross the line into Kansas, and was very properly arrested for an infringement of the law of the latter. There should be no difference between the laws of Kansas and Missouri, for their climate and latitude and game are essentially the same.

We have now stated the facts and the necessities of the case. We propose a practical application of the remedy, premising (and taking the highest English authority as judges of the question) that "it is a known fact that all the best measures for the protection of game, the most judicious, not only for the sportsmen but for those who gain their subsistence by shooting and fishing, must always emanate from those who shoot and fish for their pleasure." Ordinarily, those who legislate, those who make the laws, are not practical sportsmen, or so well informed on the subject as to serve advantageously as scientific economists. It is proper, therefore, that the drafts of any bill or bills to be submitted to future legislative bodies should emanate from the sportsmen, naturalists, and fish culturists of the country, who make our game animals, their habits, their protection, their pursuit, and their propagation a constant and intelligent study. The remedy, then, and its application, lies in the co-operation of all the scientific and acclimating societies and sportsmen's clubs in the Union, and we are herewith encouraged by the Game Protective Society of New York and the American Fish Culturists' Association of the United States (to both of which the scheme has been presented) to lay before all these clubs and associations the importance of calling at an early day a convention of sportsmen, naturalists, and culturists to select a board of arbitration or reference, which shall prepare a suitable draft of a law to be pressed for passage upon the legislatures of the respective States, this reference to be final, the Legislature to sit as a committee of the whole, and the bill to be either rejected or accepted unconditionally. Legislators who have the interests of the country at heart would not be jealous of their prerogatives in such case; indeed, they should be gratified to be relieved of the arduous labor and responsibility of so important a measure. We have received a great number of letters urging this movement for a general convention, details of which will soon be published, and we have no doubt that all clubs will readily fall in with it.

At the convention of Fish Culturists in February, we first introduced this scheme to their attention, and a resolution in conformity therewith was unanimously adopted by them as respects "fish and birds," the word "animals" being inadvertently omitted.

Delaware.—All the rules for killing birds, fish or game in this State are irregular and inefficient. In Kent, or Sussex, or Newcastle no partridges or pheasants to be killed between the 1st of February and 15th of October, nor any woodcock between the 1st of February and 1st of July. An act is now proposed before the Assembly making the close season January 1st to September 1st. Reed Birds and Rail, close time from December 1st to September 1st. The California bill is before the Legislature, but not yet passed. This table is compiled from the game laws of the several States as we find them, and if there are any errors, our readers must not hold us responsible.

Shot Gun and Rifle.

GAME IN SEASON FOR MARCH.

Snipe, Brant, Ducks and Wild Fowl generally.

FOR FLORIDA.

Red Deer, *Caracus Virginianus*) Wild Turkey, *Meleagris gallopavo*.)
 Woodcock, *Philohela minor*.) Quail, *Oryz Virginianus*.)
 Snipe, Plover, Curlew, etc., in great variety.

Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that we were to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.

CONLIN'S TOURNAMENT.—Some of the best, if not the very best, shooting with the rifle at short range that has ever been recorded was accomplished in this match. The targets were suspended bullets, three quarters of an inch in diameter, hung at a distance of seventy-five feet. The first three prizes were for the greatest number of consecutive bullets; the fourth and fifth prizes were for the greatest number of bullets hit out of twenty shots. The first was carried off by Mr. Collins, of New Jersey, the second lay between Wilson MacDonald and J. P. M. Richards, the champion shot of the gallant Seventh Regiment. The meeting of these two accurate shooters, to shoot off the tie, was set for Wednesday evening, when Mr. Richards made six bullets and Mr. MacDonald five, giving the former the second and the latter the third prize for consecutive bullets. The prize for the best in twenty shots fell to C. E. DeForrest, of Pittsburgh, and the second to Leon Backer, of the Twenty-second New York Regiment. Although their scores were not the highest, they took the prizes for the reason that those who carried off the three first were only entitled to one prize. The following are the scores made by those who contended during the tournament:—

RECORD OF THE TOURNAMENT BEGAN JAN. 12TH AND ENDING FEB. 21ST AT CONLIN'S GALLERY, 930 BROADWAY. Each contestant entitled to but one prize.

Name.	For Consecutive Bullets			Greatest No. in 20 shots.	Greatest No. in 15 shots.
	1st p'ze	2d p'ze	3d p'ze	4th prize.	5th prize.
Mr. Collins, N. J.	9			15	14
J. P. M. Richards		7		13	11
Wilson MacDonald			7	14	12
C. E. DeForrest, Pa.			6	14	11
Leon Backer, N. Y.			6	13	11
Wm. Hayes, N. J.			6	13	9
B. D. Herrick, N. Y.			6	11	9
P. Gilsey			6	11	9
L. Bird			6	11	8
Nicholas Saltus			6	10	8
Wm. Silverhorn			6	10	8
Waller Jones			6	10	8
W. S. Gales			6	11	7
Wm. H. Richards			5	9	6
T. W. Hartfield			5	8	6
A. T. Caldwell			5	9	7
H. Bleazard			5	8	6
John Traggesser			5	9	7
J. Abrons			5	8	7
E. T. Marsh			5	8	5
Herman Kenenbly			5	8	4
D. Fulkerson			5	9	6

The following gentlemen did not complete their scores, and are therefore not recorded as prize winners:

H. Fulton, Robert Miller, D. V. H. Berthold, Frank Lord, A. Marsh, H. P. Carrington, James Ross, S. J. Kellogg, L. C. Bruce, Alex. Pyle, E. P. Sanford, Thos. Warner, A. V. Canfield, Jr., R. Hopf, E. Ralph, D. R. Offley, J. W. Sageman, A. B. Davis, Wm. S. Gregory, Charles Peck, E. F. Jenkins, L. T. Montgomery, P. H. Morris, Lawrence Andrews, A. Y. Zachas, James H. Smith, John H. Abeel, Jr., and Jas. H. Winslow.

It will be observed that those who made good shooting in this short range match invariably shot well at Creedmoor, showing that those who can handle the rifle well in one place can shoot accurately anywhere. We noticed throughout this tournament that the best shots held their guns in the same position, not only firmly against the shoulder, but with grace, ease, and elegance.

Mr. Collin's position is one of great firmness, showing remarkable steadiness of nerve.

Mr. Richards is exceedingly graceful. He stands and shoots with a semi-military air.

Mr. MacDonald handles his rifle like an old accomplished marksman—body erect, head well back, and right arm elevated. Deliberate aim shooting is not exactly his forte, but in all kinds of fancy shooting, at the word, pipe shooting, etc., he has no superior.

Mr. DeForrest is a very quick shot; he handles his weapon with great ease, and fires rapidly.

Mr. Backer, the winner of the State prize at Creedmoor last year, is rather of the military school of shooters; he has plenty of nerve and good judgment, and with practice and care will make one of our crack shots.

The shooting in this match is beyond all question the best on record. It may be equalled, but we very much doubt if it can be beaten.

There were a large number of gentlemen in the match, and many agreeable reunions occurred among those who are devoted to the rifle.

Great praise is due to Mr. Conlin for the fair and impartial manner in which he conducted this tournament, and he has already received the thanks of the gentlemen competitors for his efforts.

PINNATED GROUSE ON LONG ISLAND.—Having made inquiries of Mr. W. E. Newton, of Smithtown, in regard to the success he had met with in introducing prairie chickens on Long Island, he informed us that about two years ago he turned out about thirty brace of good, lively birds, coming from Iowa, and that they are breeding and doing quite well. Several packs of young birds were seen last summer, and their peculiar track was very often noticed on the snow this winter. As far as possible, they have been most carefully preserved, and will not be disturbed until 1877. This is quite an interesting fact. There

is no doubt but that fifty years ago prairie chickens were found on Long Island. Should the birds be found even in moderate quantity at the expiration of their time of rest, Mr. Newton's effort to bring back the pinnated grouse to our neighborhood will no doubt be repeated in other sections of the country.

—A grand fox hunt, after the fashion of the olden time, took place at Rutland, Vermont, last Friday. On Thursday a large party assembled at the residence of the Messrs. Pierce, where they were handsomely entertained by a ball and banquet. The next morning over two hundred persons assembled to witness the trial of hounds. Worcester was well represented, and it seemed as though every town throughout the county had furnished delegates. A live fox, which had been obtained by Mr. Pierce, was led a circuitous route of about two miles over the hills and through the woods and vales. At a given signal the hounds were let loose upon the track. Thirteen dogs started together, and right merrily did the air ring with their music. Most of them continued to the end of the trail, where the judges awarded the premiums to the first three arrivals.

—T. S. D. writes to us from Montgomery, Alabama, March 2d, deplorably:—"We have no game laws here, and all are yet shooting bob whites, woodcocks, etc. The past week a gentleman, while gunning, killed a woodcock. I found she had been setting upon a nest of eggs, and upon examining them found they were nearly ready to hatch. The remorse caused him to take the balance of the eggs and put them under a setting hen at a negro's hut close at hand. Snipe shooting is at its height now, but they are not so plenty as formerly."

—The Halifax (Nova Scotia) *Chronicle* contains the following statement respecting the rapid diminution of moose in the Province of Nova Scotia. We are delighted to learn that a practical effort is to be made to prevent their extermination, and we feel that total prohibition for a stated period, with stringent penalties, and duly authorized wardens or foresters to make arrests, is the only mode to accomplish the desired result:—

"In former years the forests of Nova Scotia abounded in moose. Now all is changed. In large tracts of forest, such as those in the vicinity of Tangier, Sheet Harbor, and St. Mary's, where a few years ago a good hunter would be certain to find a score of the noblest moose on a single good day, one may roam for days without finding a moose of any kind, or if perchance he does find one it proves to be a poor farrow cow. The poor settlers and the Indians who hunt the moose for food find the supply dying out. Our own sportsmen seldom go to the woods, and the English sportsmen have ceased to come to Nova Scotia. This change has been brought about by the wholesale slaughter of the moose, and especially of full grown bulls, which stand when attacked and are easily shot down. The slaughter has no doubt been carried on by some who call themselves sportsmen, but the chief offenders are hunters who find that the unrestricted killing of moose is a source of profit. Once there was a society for the protection of fish and game, which made some effort to have the laws enforced, but it died, and there has since been nobody to prosecute offenders. There is a close season, during which the killing of moose is prohibited, yet moose are killed in that season, and the hides are sold and exported almost without any attempt at concealment. There is a law limiting the number of moose that may be killed by one hunter in a season, and by a party of hunters at one hunt, yet the animals, when found, are slaughtered without number. It is nobody's business to take proceedings to have the law enforced, and nobody does it. If the slaughter of moose is to continue as it has for several years, the animals, already very scarce, must become extinct. Some of our sportsmen, who take a warm interest in the matter, have determined to make an effort to save the moose from destruction. The plan they have adopted, after careful consideration, is to prohibit the killing of moose altogether for a period of three years, and to have commissioners appointed whose duty it will be to prosecute all offenders against the game laws. Petitions asking the Legislature to pass the law desired are now in course of signature."

—The Woodside Shooting Club of Long Island elected the following officers for the year 1874:—President, J. A. F. Kelly; Vice President, C. T. Howell, Jr.; Secretary, W. T. Cameron; Treasurer, J. C. Kelly.

—The Flushing Sportsmen's Club, of Long Island, held a meeting on Friday last. It was resolved to apply to the Legislature for the passage of an act making it a legal incorporated body.

—A rifle association has lately been organized in Flushing, of which Joseph Adams is President, George Adams, Treasurer, and Christopher Robinson, Secretary.

—The Excelsior Sporting Club, of Brooklyn, have elected the following officers for the ensuing year:—President, Alexis Witte; Vice President, Adolph E. Naumann; Secretary, John Delclisur; Treasurer, Anson Delclisur.

—More than one hundred deer were killed in St. Clair township, Westmoreland county, Penn., during the month of December. In Dauphin county, six miles from the Schuylkill boundary, fifty-four have been shot this season.

—The Montgomery Shooting Club of Montgomery, Alabama, have elected the following officers for the year 1874:—Vice President, H. B. Metcalf; Secretary, T. S. Doran; Regents, George Todd and J. Metcalf. This club has about forty active members.

—The Merry Mount Shooting Club was organized in Quincy, Massachusetts, on the 28th ult. The officers elected were:—President, George Monk; Secretary, Samuel Bass; Treasurer, Samuel H. Spear; Executive Committee, George W. Morton and Edward Hardwick. C.E.S.

—Thirty-five foxes have been killed at East Falmouth, Massachusetts, this winter. Fox hunting is a favorite amusement on Cape Cod, and the game is abundant.

—A few days since a boy set a mink trap in the woods of Carver, Mass., and left it. Upon visiting it shortly afterward he found his trap sprung and by the side of it a dead doe, which had evidently been caught in it, and in the effort to get clear had fallen headlong into a boggy place and been drowned. The creature weighed eighty-five pounds after being dressed.

—A dromedary, perfectly white in color, has just been received at the Jardin des Plantes. This description of animal is even rarer than the white elephant.

—Wild cats are said to be plenty in the Catskill mountains this winter.

—The following is the score of a pigeon match shot at the Suffolk Park, Philadelphia, by two well known amateur shooters for a purse of fifty dollars, fifteen birds each, twenty-one yards rise, eighty yards boundary:—

B. Morton—1 1 1 1 1 0 0 0 1 0 1 1 1 1.—11.

Mr. "Ramsey"—1 1 1 1 0 0 0 1 1 0 1 1 1 1.—11.

The tie was then shot off, and resulted as follows:—

Morton—0 1 1 1 1.—4

"Ramsey"—0 0 1 0 0.—1.

Trapper for Morton, Dick Wood; trapper for Ramsey, W. Morton; judge, W. Schuyler. "Homo."

—The Bluff City Shooting Club of Memphis, Tennessee, had a glorious two days sport last week on the Chickasaw Jersey Club course. The sports began with a deer hunt; there were some twenty-five gentlemen superbly mounted, and eleven couples of well bred hounds on the course. A yearling buck was uncared, giving him twenty minutes start. He dashed off at a slashing pace, followed by the hounds in full cry, a blue dog called "Tuther" leading, the lithe buck making some splendid leaps, and after doubling, closely followed by the hounds, he was thrown and pinned by the dogs "Tuther" and "Pat Malloy," but fortunately escaped unhurt by several gentlemen coming up and calling off the dogs. The next sport was a fox hunt, which was speedily ended by the hounds killing the fox after a short run. The pigeon shooting handicap was next in order. Messrs. A. J. Hays and T. M. Horsefall acted as judges, and M. Miller handled the strings. The match was a handicap at single birds, eighty yards boundary, for three solid silver goblets. The entries were as follows:—27 yards, Dr. D. D. Saunders, W. H. Dickason, F. J. Burrows, E. J. Wallace, James Tate; 25 yards, Arthur Wheatley, C. F. Leland, Arthur Merriman, P. Simonson, William Bowles, J. A. Cockrell, R. W. Lightburne; 23 yards, George R. Phelan, J. W. Alley, Henry Ring, A. D. Gibson, David Bryson, William Gates, Joseph Specht; 21 yards, Andrew F. Grainger, H. P. Johnson, Richard Dyer; 18 yards, M. J. Blessing, J. P. Walker. The following is the score:—

At 27 yards—

D. D. Saunders—1 1 1 1 1 1 1 1.—8.

F. J. Burrows—1 1 1 1 1 1 1 1.—8.

W. H. Dickason—1 0 1 1 1 0 0 1.—5.

E. J. Wallace—0 0 1 1 0 1 1 1.—5.

James Tate—0 1 0†.

At 25 yards—

P. Simpson—1 0 1 1 1 1 1 1.—7.

William Bowles, Jr.—1 1 1 0 1 1 0 1.—6.

R. W. Lightburne—0* 0* 0* 0* 1 1 1 1 0 1.—6.

R. W. Lightburne—0 0 1 1 1 1 1 0.—5.

J. A. Cockrell—1 1 0 1 0 1 1 0.—5.

C. F. Leland—1 1 1 0 0 1 0 1.—5.

C. E. Leland—0 1 0 1 1 1 0 0.—4.

Arthur Merriman—0 0* 1 1 1 1 0 0.—5.

Arthur Merriman—1 0 0 1 1 0 1 0.—4.

Arthur W. Wheatley—1 1 1 1 0 1 0 1.—6.

At 23 yards—

J. W. Alley—1 1 1 1 0 1 1 1.—7.

William Gates—1 1 1 1 1 1 1 0.—7.

David Bryson—1 0 1 1 1 1 1 1.—7.

Joseph Specht, Jr.—1 1 0 1 1 1 0 1.—6.

A. D. Gibson—1 1 1 0 0 1 0 1.—5.

A. D. Gibson—1 0 0 1 0 0 1 1.—4.

Henry Ring—1 1 1 1 0 0 0 1.—5.

George R. Phelan—0 0* 0 1 1 1 0 1 0.—4.

At 21 yards—

A. F. Grainger—1 1 0 1 0 1 1 1.—6.

Richard Dyer—1 0 1 1 0* 0 1 0†.—5.

H. P. Johnson—0 0 1 1 0 0* 0 0†.—2.

At 18 yards—

M. J. Blessing—0* 1 0 0 1 1 0 0.—3.

J. P. Walker—0 0 1 0* 0 0* 0†.—1.

* No birds.

† Withdrew.

‡ Not retrieved.

The ties for the first prize were Dr. Saunders and Mr. Burrows; for the second, Messrs. J. W. Alley, Wm. Yates, David Bryson, and P. Simpson; for the third prize, Messrs. Wm. Bowles, Jr., Joseph Specht, Jr., A. W. Wheatley, A. F. Grainger, and R. W. Lightburne.

At 32 yards—

D. D. Saunders—0* 1 0* 0 0 1 1.—3.

F. J. Burrows—1 0 0 0 1.—2.

At 30 yards—

A. W. Wheatley—1 1 1 0 1.—4.

P. Simpson—1 1 1 0 0.—3.

At 28 yards—

J. W. Alley—1 1 0 0* 0 1.—3.

D. Bryson—0 0 1 1 1.—3.

* No bird.

CONSOLATION PURSES.

A couple of private purses, one at single (21 yards), the other at doubles (18 yards), were shot. Mr. Specht won the former, killing three out of four, to Andy Grainger's two and Ed. Wells' one. The one at double birds was won by Mr. William Bowles, Jr., who killed both of his double rises to E. W. Wells' 2, Charley Leland's 2, Andy Grainger's 2, and Arthur Merriman's 1.

R. W. S., President.

WASHINGTON, D. C., March 6, 1874.

EDITOR FOREST AND STREAM:—

The tie between Derrick, Sherwood and Williams, the result of the match of 23d February, was arranged to be shot off on the 2d of March, and all parties and their friends were promptly on the ground at Kalorama and had proceeded to arrange the trap, when an order came from Major Richards, Superintendent of Police, that all pigeon matches in the District of Columbia should be broken up. Talking to the officer and his comrades who brought the order was useless, and the shooters had to adjourn to French's to make other arrangements, and Jackson City, in Virginia, just across the long bridge from Washington, was the place selected, and will be hereafter the resort of all such matches. We fail to see any just reason why pigeon shooting should be stopped here and we do not know of any like precedent. I append the score:

Williams—0 1 0 0 0 1 1 0 0 0 1 1 1—7.
Derrick—1 0 0 1 1 1 1 1 0 1 1 0 0—10.
Sherwood—0 1 1 0 0 1 0 1 0 1 0 1 0—7.
Referee—French; Judges, Marr, Wardell, House. J. N. D., Jr.

TORONTO, March 6, 1874.

EDITOR FOREST AND STREAM:—

Our second shoot did not take place as was anticipated on Saturday, 21st ult., on account of the death of one of Toronto's oldest sportsmen whose funeral was held on that day, so it was postponed until Tuesday, the 24th when it came off on Lumber's farm.

In the last match they should have shot at fifteen birds, but on account of scarcity they only shot at ten birds each. In this they shot at fifteen each, with the following result:

Yards.	Score.	Total.
18....James Rose	1 1 0 1 0 6 1 0 0 0 9 1 0 1 1—	7
19....J. Maughan	1 0 1 1 1 1 0 0 0 0 0 1 0 1—	7
19....C. Pickering	0 1 1 0 1 0 1 1 1 1 1 0 1 0—	10
21....J. Taylor	0 1 1 1 0 1 1 0 0 1 0 0 1 0—	8
19....J. Kennedy	1 0 0 0 1 1 0 1 1 1 1 0 0 0—	7
18....J. Morrison	1 1 0 1 0 0 1 0 1 0 1 1 1—	9
18....S. Herring	1 0 0 0 0 0 0 0 0—	Withdrawn.
18....W. Smith	1 0 1 1 0 1 0 1 0 0 0 1 1—	7
18....R. Ardagh	0 0 1 0 1 1 0 1 0 0 1 1 0 1 0—	7

We had another shoot on Saturday, February 28, when J. Morrison and J. Taylor tied, and not having any more birds the match was postponed until next Saturday, March 7th.

AKRON, OHIO, Feb. 28, 1874.

EDITOR FOREST AND STREAM:—

We have a very live sporting club, organized in town here named Summit Sporting Club. We have fine club rooms, a library and cabinet of curiosities. A few of us have your paper and consider it the best one published in the interest of sportsmen. Our State legislature, now in session, have a bill before them asking the passage of a more stringent game law. It is advocated warmly by the State "Grange," and as warmly opposed by remonstrances from several counties. At present it is impossible to say which will prevail. The following is a copy of the bill:—

That the Legislature of Ohio be respectfully urged to amend the game laws of Ohio so as to secure to the owner or occupier of lands all game thereon; to make all persons who shall catch or kill the same upon the premises of another liable to the owner or occupier of said land for the value of said game, and for all damages resulting from the catching or killing by said trespassers, and it may be made a penal offense, punishable by fine and imprisonment, for any person to go upon the premises of another for the purpose of killing aforesaid."

Sea and River Fishing.

FISH IN SEASON IN MARCH.

Speckled Trout. Salmon Trout or Teague. Land-locked salmon on

Exception is made in the State of Pennsylvania, where the close season does not end until April. In New York, the season begins on the 15th of March and in Massachusetts on the 20th March.

Southern Waters.	Sheepshead
Pompano.	Trout, (Black Bass.)
Snapper.	Drum, (two species.)
Grouper.	Kingfish.
Rockfish.	Striped Bass.
	Tailorfish.
	Sea Bass.

—On Sunday, the 13th instant, the close season for trout ends in this State, and we doubt not that anglers will hasten to avail themselves of their privileges. We hear of large delegations booked for the several trout ponds and streams on Long Island, and we doubt not Carman's, Aaron Vail's, Suffolk and South Side Clubs, Minell's and Massapqua, and the Cedar and New Bridge creeks will be fringed with rods as thick as cane-brakes on a southern bayou. If any of these ambitious gentlemen are fined \$25 for fishing on Sunday, it will not be because we did not warn them that such a penalty attaches to a violation of the Sunday law. And yet the temptation to violate the law will be great.

—Three parties, Nat Miller, Nelson Hawkins and a colored man have been indicted by the grand jury at Riverhead, L. I., for stealing young fish from the ponds of H. J. Bishop and the Suffolk Club, for whom Miller was keeper and constable. Nelson Hawkins became Miller's bond when he was elected constable. The result of the trial is looked to with great interest by sportsmen on Long Island. Bellport is situated on the south side of the Island, where are located some of the best trout ponds in the country. Mr. Bishop is determined to prosecute fully, and he should have the sympathy and encouragement of all sportsmen in detecting and punishing wrong doing. If these men are guilty they should have full punishment.

—Princess Bay is now alive with oyster men planting their Virginia seedlings. If we were to call these hard working fellows *aquaculturists* it may be they would think themselves insulted, as the fish-woman was when Daniel O'Connell told her her husband was an octahedron.

—Dr. Fletcher has lately procured two hundred and sixty thousand salmon eggs and placed them at Robinson's Fish Nursery in Meredith Village, N. H. When hatched they are to be placed in the Connecticut River. A combined effort is to be made this year, by the Fish Commissioners of several States, to test the capabilities of the Holyoke Dam for the passage of salmon. Dr. Fletcher has also procured fifty thousand salmon trout, which he contemplates putting into Ossipee Lake and Six-Mile Pond, which are connected with a rapid stream of water.

—A bill is before the Maryland Legislature that provides for the appointment of a State Fish Commission, and no doubt will become a law. A law for the same purpose was passed by the Legislature of 1870, and expired without any appointment under it.

—Walter M. Brackett, Esq., the inimitable painter of beautiful trout and an earnest devotee to the sports of the wildwood, sends us the following notes upon the characteristics of the salmon of the Pacific:

"A careful examination of the California salmon, (*salmo gairdneri*) which come to our markets, discovers that they differ materially from the *salmo salar* of the Atlantic. They have no dark spots below the lateral line, which our fish have. The dorsal and caudal fins are thickly covered with small black spots, which our salmon have not. The proportion of the head to the body is as one to four, whilst the fish of our coast is as one to five, and sometimes five and one half. There is still another difference which to the angler is a very essential one, namely, the entire absence of beauty of proportion and graceful outline, with no more to attract the eye than the 'bluefish' of our waters. Our *salmo salar*, as you well know is as beautiful as a poet's dream, and worthy the admiration of the most cultivated and refined angler that ever cast a fly upon the limpid waters of a Canadian salmon river. To even draw comparison between this beautiful creature and the ugly, bullheaded and awkward fish we get from California is nothing short of rank heresy."

It should be stated in behalf of the California salmon that those that appear in our markets have lost their lustre by being long caught, while it is known that they are generally taken during the summer when they are by no means in their prime, and lack the more brilliant hues and shapely contour of the winter runs.—[Ed.]

—We are in receipt of the following letter dated at Enterprise, Florida, Feb. 25, which we deem important in evidence of our persistent advocacy of fly fishing for bass, and our statement which some captious persons have seemed to think ought to be taken *cum grano salis*. At Palatka, in 1872, we took large numbers of bass with a Leonard bamboo fly rod of eight ounces weight, and astonished George Lucas and other old fishermen of the town by the extraordinary results of this (to them) new method. The same season, from off the bridge that crosses the St. Sebastian, back of St. Augustine, we took bass with flies, fishing on the flood tide, just about an hour before slack water. Here is the letter:—

EDITOR FOREST AND STREAM:—

Your "Fred Beverly" is probably now among the Everglades, and will hardly be able to transmit to you a record of the very fine fly fishing for bass (*grystes salmoides*) we are now getting here. Two days ago I was out with a light trout rod and flies, and took thirty-five bass and two perch; total weight, sixty-four pounds, besides a garfish. Sometimes I throw but one and at other times three flies. I found the fish to rise freely to large trout flies. Twice I took triplets, and frequently couples. Just before dark the white miller is very taking.

Yesterday Mr. T. J. Falls, with a split bamboo trout rod and flies, took eighty-eight bass and three perch; total weight, 128½ pounds, besides three garfish and one alligator gar. The most of his work was done with a fly tied by himself of red body and wings of the "robin snipe" and jungle cock. He sometimes used three flies and once took triplets and frequently couples.

The largest bass taken here this season was captured with the fly by Mr. E. D. Lawrence, of Louisville, Ky. It weighed eight pounds. The spoon is now at a discount here.

B. HACKLE.

—The Massachusetts Legislative Committee on Fisheries have reported the bill concerning lobsters in a new draft, forbidding their being caught under 10½ inches in length

—The Littleton, New Hampshire, *Republican* reports numerous violations of the fishery laws along the ponds and streams of the White Mountains. It says:—"We saw a handsome string of pickerel and some trout going home last Saturday. We hear also of another pond in this vicinity from which these came not long since, at the hands of a veteran angler of somewhat more than three score and ten years, a trout weighing two pounds and ten ounces." The same paper states that the town of Lake Village, N. H., captures and exports a million of minnows every day.

—Last July, John Como, one of the crew of schooner Magic of Gloucester, caught a small halibut on the Banks, on which he took a notion to cut his initials, and threw the fish overboard, not expecting to see him again. This season he shipped in schooner Mary E. Daniels, and while hauling his trawl on the Grand Banks, about a fortnight since, discovered, to his great surprise, the identical halibut he had marked some eight months before. The schooner arrived at Gloucester on Wednesday, and the halibut was on exhibition at the wharf of the New England Fish Company. The initials were plainly discernible, although the fish had grown considerably since they were cut. This is no fish story, but a veritable fact, and the circumstance is certainly a most remarkable one.—*Gloucester Advertiser*.

—From the *Overland Monthly* of this month we copy the following, taken from an interesting article on the head waters of the Sacramento:—

"All the rivers are stocked with splendid trout; the McCloud River—easily reached from Shasta by wagon-road—containing a rare species, called the Dolly Varden, from its large red spots, known to the Indians as the *Wye-dul-dicket*, and found in no other stream in California, and nowhere out of the State, except possibly in Oregon. This is believed to be the same fish described in some of the railroad reports as *Salmo spectabilis*. Besides the true brook or river trout, the Sacramento and McCloud contain the large salmon trout, and in the season—at its height in July—are filled with salmon. Castle Lake is one of the best fly-fishing places in the State. As this whole northern region is wild and little explored, there being few settlers apart from the stage-stations along the one road running between Redding and Yreka, game has not been thinned out or scared away, and there is an opportunity for some original exploration. The few Indians remaining are mostly domesticated, and none are troublesome.

—The Maine Legislature has amended the game laws so that the killing of woodcock, woodcock, or English snipe is forbidden between January 1 and July 4, and the killing of quail, grouse, or partridges between January 1 and September 1, under a penalty of not less than \$5 nor more than \$10 for each bird killed. Only sporting with firearms in the killing of these birds is allowed. The killing of larks, robins, swallows, sparrows, or orioles is not allowed between January 1 and September 1 under a penalty of \$5 for every bird killed. This, however, does not apply to the killing of robins on one's own premises during the period when summer fruits are ripening. Any person who maliciously destroys the nest, eggs, or unfledged young of any wild bird, excepting crows, hawks, and owls, or who removes the eggs or young from the nest, is liable

to a penalty of not less than \$1 nor more than \$10 for every nest, egg, or young so taken or destroyed.

The close time for land locked salmon, togue, and trout in the St. Croix River and its tributaries has been extended from September 15 to March 1, beginning the present year.

An act for the better protection of lobsters in the waters of Maine has passed, which provides that no lobsters shall be caught or sold between August 1 and October 15 of each year, and from October 15 to April 1 next following no lobsters shall be caught or sold under ten and one half inches in length. From April 1 to August 1 all restrictions are removed as to time and size, as well as in the taking or selling of lobsters.

The taking of land locked salmon, togue, or trout in any of the waters of the State by any other means than by line and hook and fly is prohibited, the penalties already established for illegal fishing to be applied to all violations.

The law has been changed so that smelt fishing in any other manner than by hook and line or dip net is prohibited between April 1 and October 1 of each year, instead of between March 1 and November 1.

Taxidermists commissioned by the governor are not amenable to the law relating to the destruction of birds.

The Legislature has also incorporated the Maine Sportsmen's Association, for the prosecution of violators of the game and fish laws.

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

BOSTON, March 2d, 1874.

EDITOR FOREST AND STREAM:—

A meeting of the Beverly Yacht Club was held at the Parker House on Saturday, February 28, at half past seven o'clock for the purpose of electing officers for the season of 1874.

The following gentlemen were elected:—Commodore, W. C. Loring, of the Surf; Vice Commodore, S. S. Gray, of the Merlin; Secretary and Treasurer, Walter Burgess, of the Tulip. Regatta Committee: Walter Burgess, of the Tulip; G. D. Hodes, of the Sodie; W. Lloyd Jeffries, of the Bluebell; E. B. Russell, and C. H. Williams.

Secretary's office is 23 Merchants' Exchange, Boston.

The following is a list of the yachts of the club, though there are some five or six yachts belonging to recently elected members whose names have not yet been returned:

Name.	Owner.	Keel or Centre Board.	Sail's L'gth.	Rig.	Port.
Agnes.....	E. P. Adams.....	1 K.	21.9	Cat.	S. Boston.
Arrow.....	H. B. Jackson.....	C. B.	21.6	Slp.	Salem.
Avon.....	F. R. Sears, Jr.....	do	18	Cat.	Nahant.
Bessie.....	W. Lewis.....	do	16.6	Cat.	Dorchester
Bluebell.....	J. W. A. Jeffries.....	do	16	Cat.	Swampscott
Curlew.....	W. Tappan.....	do	18	Cat.	Swampscott
Charlotte.....	F. Peabody.....	do	22	Slp.	Nahant.
Eva.....	J. A. Iasigi.....	do	25	Slp.	Swampscott

Water Lilly.....	P. Grant, Jr.....	do	19	Cat.	Nahant.
White Wing.....	P. Dexter.....	do	21.6	Slp.	S. Boston.

The sailing length is the length on the water line. The yachts of the club are limited to those of thirty feet and under on the water line. Yours,

BLUE WITH A GOLD CASTLE.

PHILADELPHIA, March 6th, 1874.

EDITOR FOREST AND STREAM:—

At a meeting of the Schuylkill Naval Board, held March 2d, the following committee was appointed to carry out a resolution to hold a regatta on the Schuylkill, in June, 1874, open to all amateurs. The prizes to be challenge prizes, to be rowed for annually:—

J. Gillenham, Undine; George W. Parker, Quaker City; R. F. B. Fairman, Pennsylvania; W. A. Steel, Crescent; E. S. Miles, University; C. B. Hart, Philadelphia; J. Bedecheimer, Malta.

The committee is instructed to issue circulars of invitation to the clubs of the country at once.

The prizes will be for fours, pairs and double and single scull shells. Presentation medals will be given to the winning crews in each case.

This is to inaugurate annual regattas on the Schuylkill and will prepare amateurs for a Grand International Regatta to be held here in 1876. Commodore Ferguson has been authorized to invite the Rowing Associations of England and France to participate upon that occasion.

JONATHAN GILLENHAM, Sec.,
Schuylkill Navy.

THE SARATOGA REGATTA COURSE.

WE were driven along the boulevard of Saratoga, past John Morrissey's solid but unpretending brick structure—down by the racing parks, until we came to Moon's Hotel. As we walked out upon the bluff in front of the hotel, our eyes rested upon a scene which elicited expressions of admiration and delight from every one present. After spending some time in an examination of the different farm-houses lying upon the borders of the lake, we made the following selections:—Yale, Mr. Myers; Harvard, Mr. James Reilly, or Schuyler; Trinity, Mr. John Reilly; Wesleyan, Mr. W. Able. Columbia had previously decided upon Mr. C. P. Moon, or Mr. Myers, and William upon Mr. H. Moon, or Schuyler. All these places are very good ones, there is not much choice between them. The moral objections urged against Saratoga are not supported by facts; some are worthless, others are absurd. That John Morrissey is the proprietor of a gambling establishment must be admitted; but that it is free of access to any one, that it invites visitors, must be denied. It is not a public gambling-house, but a private club-house, very difficult of access. All who enter are sharply questioned, and if it does not appear that they are members, or friends of members, they are excluded. Many persons are daily turned away from its doors. It is wellnigh impossible for a young man to gain admission there; much less, then, a college student. John Morrissey is a very shrewd man, and he knows very well that should any college student be fleeced in his rooms, the hostility already existing in Saratoga against him would be fanned to such a breeze that he would be compelled to give up his business entirely. A gentleman assured your correspondent that John Morrissey told him that rather than have the College Regatta in Saratoga, he would give \$1,000.

The Saratoga Rowing Association has demonstrated its ability to suppress pool selling, in the case of the National Amateur Regatta, held here last August. Public sentiment in Saratoga, which has hitherto been rather careless on the subject of the regatta, is now fully aroused. Every one, from the hod-carrier upward, is so jealous of the honor of the city, that all will do their utmost to render the next College Regatta a success in every particular. We were greatly pleased with the men comprising the Saratoga Rowing Association, they are all gentlemen of high character and integrity. Enthusiastic as Mr. Conkling, the President, certainly was, he has not exaggerated the advantages offered by Saratoga.—*Corr. College Argus.*

YACHTING NOTES.—The approach of spring always produces activity among the yachting men, and the fine open weather which has prevailed for the past few days has already awakened some of them. Several Brooklyn yachts have been sold and it is not probable that their places will be supplied. The following, which had wintered at Commodore Frank Bates', have changed hands:—

The Lina S., 21 feet, 6 inches, has gone to Key West. Ada, cabin sloop, 40 feet, owned by Dr. Bliven, has gone to Florida.

Flirt, steam propeller, has gone to Florida. Coquette, sloop, 23 feet, owned by the Columbia Yacht Club, has been sold and goes to Charleston.

Cloud, sloop, 26 feet, owned by the Columbia Yacht Club, has been sold to a club on the North River.

Monroe, sloop, 28 feet, has been sold to a Jersey club.

Midnight, sloop, has been sold to the Staten Island Club; now at Frank Bates'.

The Eddie, owned by Commodore Hughes, of the Oceanic Yacht Club, will be got afloat as soon as possible, the Commodore being anxious to have the first sail of the season.

Mr. George Farley intends making considerable alterations in the rig of his fast little sloops, Only Daughter and Short Branch. A match is talked of between the former and a Harlem yacht, but nothing definite has yet been arranged. Mr. Farley says that with the new rig nothing afloat of their size will keep up with them.

The Sophia, Brooklyn, W. T. Lee, and several others, now at the foot of Court street, will soon be got ready for sailing, and although the season will not show many new boats, it will be a lively one in yachting. The Dauntless will be in commission again, and several races between last year's new boats, especially the medium sized schooners, are already being talked of.

Mr. G. L. Haight's sloop Genia, will appear in an entirely new rig.—*Brooklyn Eagle.*

—The Williamsburg Yacht Club held their annual meeting last week at the Club House, foot of Eagle street, Greenpoint, when the following officers were elected for the ensuing year:—

Commodore, William H. Rexter; Vice Commodore, James Clifford; President, T. W. Reeves; Secretary, Charles E. Mielke; Assistant Secretary, A. Parick; Treasurer, Chas. Lahman; Measurer, Joseph Northrop; Steward, Edward Grissan; Trustees, S. S. Free, Frank Thorne, Isaac Merrett, Edward Grissan, William Sware; Regatta Committee, Gallaudet Pease, Levi Smith, William Joy, George W. Kidd, E. O. Tuttle.

This club has a fleet of twenty cabin and open boats, its membership amounts to 100, and the New Club House is a very elegant and useful building. The annual regatta will take place in June.

—At the annual meeting of the Union Boat Club held in Boston, Monday evening 2d instant, the following officers for the ensuing year were elected:—

President, Henry B. Rice; Vice President, Edward N. Fenno, Captain, Robert S. Russell; Lieutenant, Charles H. Williams; Secretary, Edward B. Robins; Treasurer, Wm. M. Rice; Directors, A. G. Baxter, Daniel Sargent, George F. Roberts.

—Commodore Ashbury (Cambria), we hear will not fit out The Iona or Livonia again. The Iona is lying on the mud at Cowes, England, for sale, and the Livonia is at present cruising in the Mediterranean, chartered by Sir F. Gooch, with the option of purchase.

—The Harlem Boating Association held their annual meeting last week when the following boat clubs sent delegates. New York Athletic, New York Rowing, Nassau Boat Club, Atalanta Boat Club, Harlem Rowing Club, Dauntless Boat Club. The following were the officers elected:—

President, H. G. Meeker, New York Athletic Club; Vice President, George Roahr, Atalanta Boat Club; Secretary and Treasurer, H. M. Knapp, Harlem Rowing Club; Directors, Mr. Ingersoll, New York Rowing Club; J. McCarthy, Dauntless Boat Club; John C. Babcock, Nassau Boat Club.

—The Argonanta Rowing Association of Bergen Point, N. J., have accepted the challenge of the Buffalo Rowing Club, that is, to row them a four-oared race, distance three miles straight away, provided they will agree to some minor alterations.

—The Woodside Rowing Club of Newark, N. J., held their annual meeting last week and elected the following officers for the ensuing year:—

President, R. Smith Carter; Vice President, J. H. Osborn; Secretary, W. A. Lentillion; Treasurer, Joseph A. Dreyfous; Captain, Wm. Robison; Directors, J. Hendricks, Peter Willer, George Nevers, C. B. Rogers, J. H. Eastwood, and Edward Benson.

—A Poughkeepsie ice-boat is said to have crossed the river at that point, distance one mile, in the incredible time of thirty-one seconds.

—The Jersey City Yacht Club held their regular meeting last week when the following gentlemen were elected to serve in their respective official capacities for the ensuing year:—

Commodore, R. Donshea; Vice Commodore, C. E. Gardner; Treasurer, A. B. Reynolds; Secretary, Frank Higham; Measurer, J. Kaylor; Board of directors, A. Brainard, John Ward, M. M. Brokaw, William Clark, J. B. Haight and E. S. Rudderow; Finance Committee, William Clark, John Ward and A. Brainard; Standing Committee, W. Oldering, A. P. Curtis and J. Duncuff.

—The boating season on the Harlem River is fairly opened and fleets of scullers are in daily practice. A very large number of boats are being built for the Harlem clubs, and the season promises unusual activity and interest.

—The following men under the coaching of W. J. Otis, L. S. S., are hard at work in the Gymnasium, for the Freshman Crew:—Messrs. Bacon, Brett Harwood, King, LeMoine, Martin, Morgan, Page, Patton, Perry, Taylor, and Wiley. Any six of the above will make a strong crew, and ought to promise well for the Regatta.—*Harvard Magenta.*

—The Columbia Boat Club of Brooklyn, at their recent annual meeting elected the following gentlemen as officers for the ensuing year:—

President, James Foster, Jr.; Vice President, L. W. Bangs; Secretary, E. A. Loveys; Treasurer, F. F. Learens, Captain, Charles S. Osborn; Lieutenant, Charles S. Butler; Coxswain, H. H. Ackerman; Trustees, W. Chapman, C. O. Lewis, John Halsey, H. R. Johnson, and G. F. Barsett.

—The Oxford and Cambridge boat race in England is attracting as usual general attention among amateur boating men. Both crews have arrived at their several headquarters on the Thames River near London. The Cambridge crew are slightly the favorites. The race takes place on Saturday, March 28th.

AMHERST, MASS., February 28, 1874.

EDITOR FOREST AND STREAM:—

The gymnasium here has recently been presented by an enthusiastic alumnus with a pair of patent rowing weights, which give so much satisfaction to our rowing men that I venture some description of them for your readers. Though I say rowing "weights," there are in fact no weights used. The apparatus consists of a cylinder filled with water, the two ends of which are connected by a small hollow tube, allowing the liquid to make a complete circuit. The cylinder is fitted with a piston, having a valve in its center opening upwards, which works between the two openings of the tube into the cylinder. One end of the cylinder is pivoted on a standard twelve or fourteen inches from the floor, so that it may swing horizontally each way. Thus arranged the oarsman sits in front of the cylinder, and his stroke draws the piston through it, forcing the water forward and through the small tube back into the cylinder again, in the rear of the piston. A receiver opens the valve in the piston and allows it to pass easily back to its first position. The stroke, instead of pulling up a weight, consists here of forcing water through a small tube, and the resistance is of course in proportion to the celerity of the piston stroke. It may be further increased by means of a stop cock, which diminishes at will the diameter of the small tube. At the end of the piston rod is a socket, which receives the oar and permits all the motions of feathering to be made. The whole contrivance gives an exercise altogether more like rowing than anything yet. I notice in a recent number of your paper a communication which devotes considerable attention to the refusal of Amherst to row at Saratoga, and her withdrawal from the National College Rowing Association. Indeed, our "childish action" seems to have disturbed the mind of your correspondent a good deal, and he hopes it may be rescinded. The subject is so threadbare—for this action has provoked an amount of discussion altogether incompatible with the idea of its being wholly erroneous—that I only feel authorized to say anything more by the way in which the action in question has been misstated and misconstrued. As it is always well to know what you are talking about, I commend to "J." before he writes anything more on this subject the perusal of the resolutions which were passed by Amherst in reference to this matter, and which appeared in your columns. Therein is correctly stated our position. Amherst believes that the college regatta is a contest between students and gentlemen; that it should be controlled and managed by such, and that it should not be made subsidiary to any other purpose whatsoever. Amherst believes that it is decidedly prejudicial to the interests of college boating to place the regatta in the hands of a community whose most prominent citizen is a blackleg, and to which he and others of his kind give tone. If, during the summer season, this is not the fact at Saratoga, then, as was said at Hartford, there is a "wide, deep seated, and ineradicable delusion on the subject" which in our opinion makes it unwise to hold the regatta there, or it being decided to do so for Amherst to participate therein.

Furthermore, we favor and always have favored a New England College Rowing Association. Whether this notion is correct or not, time will determine and any present discussion would be useless. Our action in refusing to row at Saratoga and withdrawing from the National Rowing Association was taken advisedly, and it is not likely to be reconsidered or rescinded.

F. W. WHITRIDGE.

NEW ORLEANS, March 6, 1874.

EDITOR FOREST AND STREAM:—

Thinking that you would like to know how the boating interest is progressing here, I write you to say it is flourishing. Since my last writing we have admitted another club—the Louisiana—to our State Rowing Association, five in all, now organized here. The Louisiana, Riverside and ourselves are established on the Mississippi, the St. John and Pelican on the Bayou St. John, a quiet little sheet of water connecting with Lake

Ponchartrain, in the rear of the city. A regatta has been arranged for September 1. The St. John and Pelican will probably have a match race about the 15th of May. Our boys are making their crews up for the coming season, and when they have a measuring of oars I shall let you know. Our river is very full just now, and rowing 1½ miles against stream is well calculated to try the rowing powers of any crew, and affords a good opportunity to the ambitious ones for the September pull to try themselves. If you can give me the name of a good book on Rowing and Training, and where I can get it I shall be obliged. I have Argonaut work. Who is the best boat builder in your neighborhood? We are putting up a new boat house, fronting on the Mississippi River. The size will be 30x60, a very elegant and neat affair, and a pleasant place to spend our leisure time.

"Trick."

Rational Pastimes.

Will our University correspondents kindly send us their most recent catalogues.

THE BASE BALL SEASON OF 1874.

THE INTERNATIONAL VISIT.

THOUGH March is the inaugural month of the professional base ball season, the amateur branch of the fraternity, composing the great majority, do not think of taking the field until the middle of April. Indeed it is May before they properly get to work. Last season was quite a successful one in regard to amateur play, especially in this city and its vicinity, but the promise is that the coming season will far surpass it in regard to the number of clubs and players participating in the season's contest; but if the rules governing amateur play are to be revised in accordance with the suggestions of the convention of December last, the play of the nines of the association clubs will be very far from equalling in excellent fielding the exhibitions of last season. The rule governing the delivery of the ball to the bat in the professional code admits of a combination of pitching and throwing which gives the pitcher full power to engage in strategic play; that is, he is allowed to send in the ball either by a slow pitch or toss, which gives the ball curved lines difficult to judge in hitting, or to send it in by an underhand throw, with the arm swinging perpendicularly to the side of the body, the only delivery of the ball which admits of speed with accuracy of aim and command of the ball. This experience has shown to be the proper rule of delivery. To this underhand throwing, however, the junior clubs of the amateur fraternity strongly object. Boy like, they want to see the rules worded so as to bring the game down to the old time level of the school boy days, when home run hits and scores of fifty runs to a match, and contests occupying over three hours was the rule of the game. Should the juniors form a majority in the coming amateur convention, and thereby bring about the return to the old rule of the legitimate pitching of the ball, then opportunities for beautiful fielding will be lost, and half the attraction of the present style of play will be lost. It is to be hoped that they will, however, adopt the more manly rule of the professional code, and thereby save their game from so retrograde a movement as that of returning to the old time style of play of fifteen years ago.

At the professional convention which took place in Boston eight clubs were represented, viz.: the Athletic, Baltimore, Boston, Chicago, Hartford, Mutual and Philadelphia, and nines of these clubs will all enter the arena to contest for the Association pennant this season. The code of rules prepared for the convention by Mr. Chadwick was adopted with but slight modification, the only rule not endorsed being that recommending the change in the game from nine men to ten. This new game, however, is to be allowed in exhibition contests, and if it works satisfactorily it is to be adopted entirely next season. The new rule is more advantageous to the amateurs than to the professionals, especially if the former carry out their plan of prohibiting any delivery but that of a pitched or tossed ball, in which case the extra man will be sadly needed to help keep down the large batting scores.

The great base ball event of 1874 will be the visit of the Boston champions and the ex-champion Athletics to England, in August next. Mr. Spalding, the *avant courier* of the tourists, has been very successful in England in his international mission, and he brings to this country full assurances of a cordial greeting to the American base ballists from their cricketing cousins of England, and of an enthusiastic welcome on the occasion of their first appearance at Lord's Grounds, London, which event has been set down to take place on the Bank holiday, August 3d. The arrangements on that day will include special accommodations for the American visitors who are expected to accompany the players, and the American flag is to be displayed from the flag staff, and the royal band is to compliment the party by playing the American national airs. It is calculated that nearly 10,000 people will be present. The London papers of February make special editorial mention of the proposed visit, and the event is fast becoming the talk of every cricket city and town in the kingdom. The ball players will include Messrs. Harry and George Wright, Spalding, Hall, Barnes, White, Leonard, McVey, Beale, and Schaffer, of Boston; and Clapp, McBride, Fidler, Sutton, Reach, Sensy, Murnan, Gedney, McMullen, and McGeary, of Philadelphia. The English cricketers are very desirous that Messrs. Chas. and Dan Newhall and Meade, noted American cricketers, shall accompany the party, and they propose to play the same English eleven against the American twenty-two ball players that they did in Philadelphia. It is to be hoped that the Young America Cricket Club will send out a delegation to help Harry Wright win some cricket matches.

—The National Association of Professional Base Ball Players was held at Boston. Mr. Charles H. Porter presided in the absence of Mr. Ferguson. The following officers were chosen for the ensuing year:—

President, Charles H. Porter, of the Red Stockings, of Boston; Vice President, Gershom B. Hubbell, of the Connecticut, of Hartford; Secretary, Nicholas E. Young, of the Chicagos; Treasurer, D. F. Houston, of the Athletics, of Philadelphia. Previous to adjournment to March, 1875, the President appointed the following standing committees: Judiciary—Nicholas E. Young, of Chicago; Charles H. Porter, of Boston; D. L. Reid, of Philadelphia; C. A. Haddell, of Baltimore; Gershom B. Hubbell, of Hartford. Championship—Houston, of the Athletics; Davidson, of the Mutuals; Hubbell, of the Hartfords.

—The Knickerbocker Base Ball Club, the oldest organization of the kind in the United States, held its annual meeting last week. The following officers were elected:—

President, J. White Davis, re-elected; Vice President, Alexander Kirkland; Secretary, J. F. Tams; Treasurer, Samuel H. Kissam; and J. B. Wells, Nathaniel C. Smith, and Wm. L. Taylor, Directors.

—The Fly-Away Base Ball Club held its annual meeting at their head-quarters, 512 East Fifteenth street, when the following officers were elected:—

For President, W. H. Kelly, Jr.; Vice President, James Shandley; Secretary, Hugh Gilgan; Treasurer, Joseph Ford. This is their sixteenth year. Their nine for the coming season will include Shanley, Gilgan, Malone, J. Britt, Ford, Conner, Jolly, Laughlin, and Dorney.

—The St. Louis Cricket Club held their annual meeting on March 4th, when the officers for the ensuing year were elected as follows:—President, Hon. Thomas Essex; Vice President, Harry E. Sharpe; Secretary, C. R. Farnum; Treasurer, W. A. Kingdon. Executive Committee, J. W. Jeffries, T. M. Caddick, E. H. Lycett, P. Adair, W. Grayson. After the routine business was ended a series of resolutions were unanimously adopted, thanking Mr. H. E. Sharpe for his untiring energy, establishing the club on a firm basis, and the successful management of the tour of the St. Louis eleven east. In reply Mr. H. C. Sharpe, the Vice President, stated: "Believing that cricket could not be established on a lasting basis unless it was taken hold of by the American element, as well as by the English, the club took the name of St. Louis, and have sought for support and maintenance from those residents of the city who realize the necessity of encouraging such institutions for the sake of the rising generation. As a nation the Americans have not yet fully understood the value of outdoor sports to those who, born in fortunate circumstances, are not compelled to work for a living. While our public school system challenges admiration, it is yet deficient in facilities for physical education. Very rarely is a case found where the lover of active sports is addicted to vicious habits—the one takes the place of the other. The mind naturally craves for excitement and for action; if a healthy, pure outlet be provided for the exuberance of animal spirits, all goes well; if not, they will seek those channels which are always at hand—the saloon, the dice box and the bagnio. It will be well for the fathers and mothers and the young men to think seriously on this subject. Especially should those living in cities, encourage outdoor games, cricket, base ball, rowing, foot ball, tennis, &c."

THE BOSTON AND ATHLETICS' TRIP TO ENGLAND.

The following is the programme of the matches of base ball and cricket arranged by Mr. A. G. Spalding of Boston, when in England:—

- Aug. 1, Boston v. Athletic, at Liverpool.
- Aug. 3, Boston v. Athletic, at London, Lords Grounds.
- Aug. 4, English Nine v. Boston, at London, Lords Grounds.
- Aug. 5, English Nine v. Athletic, at London, Lords Grounds.
- Aug. 6, Exhibition game, at Crystal Palace.
- Aug. 7, Athletic v. Boston, at the Oval.
- Aug. 8, American Twenty-two v. Gentlemen's Eleven, at the Oval.
- Aug. 10, American Nine v. Cricketers' Nine, at Princess' Green.
- Aug. 11, Boston v. Athletic, at Princess'.
- Aug. 12, Exhibition game, at Lillie-bridge Grounds.
- Aug. 13, Exhibition game, at Lillie bridge Grounds.
- Aug. 14, Boston v. Athletic, at Nottingham.
- Aug. 16, Americans v. English, at Nottingham.
- Aug. 17, Athletic v. Boston, at Sheffield.
- Aug. 18, American v. English, at cricket, at Sheffield.
- Aug. 19, Boston v. Athletic, at Manchester.
- Aug. 20, American Twenty-two v. Lancashire Eleven, at Manchester.
- Aug. 21, American Twenty-two v. Lancashire Eleven, at Manchester.
- Aug. 23, American Nine v. English Nine, at Manchester.
- Aug. 24, Exhibition game, at Liverpool.
- Aug. 25, American v. English, at Liverpool.

—The pupils of Prof. James O'Neil gave a complimentary testimonial to their professor at Wood's Gymnasium, East Twenty-eighth street, on Saturday last. W. Stafford and J. Phillips opened the entertainment by a sparring match. Prof. James O'Neil and James Reynolds then showed some "quick counters" in the amateur manly art. Several other gentlemen exhibited considerable skill and good training, which frequently elicited marked applause from the spectators. E. A. Johnson and Capt. Jouerrerd then made their appearance on the boards, and went through a series of dexterous manoeuvres in fencing with foils. The exercises were then agreeably varied by a masterly trapeze performance by Shed Le Clair, whose wonderful dexterity was repeatedly applauded. Henry Buermeyer and Luke Walsh next engaged in an interesting sparring match, and the evening's entertainment was brought to a close by another exhibition with the gloves between Prof. J. O'Neil and A. V. Gorceurta, one of his pupils.

—On Friday last, March 6th, there was held at Buena Ridge, Mott Haven, an archery meeting attended by certainly one hundred and fifty ladies and gentlemen. Some twelve ladies contested for the prize, which was a handsome gold medal. The names of the ladies were as follows:—Miss Flynn, of Boston; Miss Brophy, of Brooklyn; Miss Morphy, of New York; Miss French, of Charleston, S. C.; the two Misses Clarke, of New York; Miss Duffie, of New York; Miss Grey, of New York; Miss Nix, of New York; Miss Baker, of New York; Miss Barkis, of Philadelphia, and Miss Costa, of Morrisania. The distance to the butts was not, it is true, a very great one, but still a fair amount of skill was shown. The target used was thirty inch, and was frequently hit by the young ladies. A tie was made as to scores between Miss Grey and Miss Duffie, which was finally decided in favor of Miss Grey, who was freely entitled to wear at her baldrick the gold medal.

—"Mens sana in sano corpore," is a trite motto, but it finds an apt illustration in the remark of the London *Graphic*, that out of the 106 men who have recently attained mathematical honors at Cambridge, and the 29 who distinguished themselves in the Law and History Tripos, there were 46 boating men, 15 cricketers, 10 foot-ball players, and 18 who devoted themselves to athletics proper, and some of them were proficient in more than one of these pastimes.

—We have received from an officer of the Quebec steamer "Secret," the following record of most extraordinary pedestrian feats performed by Josiah Eaton, the authenticity of which is vouched for by J. M. Lemoine, Esq., of Quebec. Some of our elderly readers may recall the occasion at Castle Garden in 1845.

QUEBEC, March, 1874.

EDITOR FOREST AND STREAM:—

According to promise, I send you a list of feats of pedestrianism performed by my father (Josiah Eaton), which is as follows:

Year 1815, performed 1,100 miles in 1,100 consecutive hours in Blackheath Conny, Kent, being at that time 49 years of age.

Year 1816, performed 1,100 miles in 1,100 hours, beginning each mile in with each hour; also at above place.

Year 1817, performed 2,000 half miles in 2,000 consecutive half hours, on Brixton Canseway, in Surrey.

Year 1817, walked from London to Colchester one day and back the next, for twenty days, being 51 miles per day.

Year 1818, walked 2,000 miles in 42 days, on Wormwood Scrubs, near Paddington.

Same year, 4,000 quarter miles in 4,000 successive quarter hours, at Stonemarket, in Suffolk.

1819, 1,000 miles in 1,000 hours, on Leicester Race Course.

FEATS PERFORMED IN AMERICA.

Year 1844, Caledonia Springs, Upper Canada, walked 1,000 miles in 1,000 hours, being at the time 79 years of age.

In the year following, walked 1,000 quarter miles in 1,000 successive quarter hours, in the Castle Garden, N. Y. With the highest respect, I remain yours,

HENRY EATON.

—The death of Mrs. Noyes, née Ada Clare, an authoress and actress, which occurred last week, was most distressing in character. On January 20th, while playing with a pet dog in this city, she was bitten in the face. The lady was immediately treated by a competent physician, who cauterized the wound with nitrate of silver. Mrs. Noyes then assumed her professional duties, when about fifteen days ago, while performing at Rochester, she was seized with the most pronounced symptoms of that fearful malady, hydrophobia, and she died in terrible agony on Wednesday last, March 4th. We have called attention to the use made of the acid nitrate of mercury in England on animals which had been bitten by mad dogs, and would recommend its use. Of course we are by no means sanguine of the success of this acid nitrate of mercury, which is a much more powerful caustic than nitrate of silver, but only desire that this should be tried. We understand that in Philadelphia Drs. Pancoast and Gross use this preparation in certain cases. It seems to us that for the sake of humanity some experiments should be made with the acid nitrate of mercury in cases of accidents from hydrophobia.

—We have been more than pleased by having had submitted to us some paintings of fish and game, the work of E. Sherman Pease, a young artist of eighteen, living at Twin Lakes, Salisbury, Connecticut. We have before us now a picture of a pickerel fresh caught, flapping on the ice. Not only is it carefully drawn, truthful in every respect, but there is about it a strength of touch and a boldness of handling which is very remarkable. Mr. Pease's hand seems very sure, and there is a boldness in the way with which his colors are put on which stamp him an artist. The head of the fish is held up by a hook, and under the jaw you see all those delicate transparent mother of pearl shades of color which are so difficult to show, and which are lost unless the conception of them strikes instantly not only the brain, but guides the hand of the artist. There is also the study of a hare, with his heavy winter coat on him, and his white tail, poor Bunny hanging by one leg from a nail, which is quite remarkable from the apparent ease with which all is done and its truthfulness. These works Mr. Pease calls studies, but very strong studies are they; better even than what we have seen called the finished work from some masters. If Mr. Pease will only toil diligently, keep at it, and believe that he has a great deal yet to learn, we prophesy that at least for subjects of this character, game birds and fish, he will make a distinguished name for himself. Mr. Pease must be something of a sportsman, as he always catches his own fish and shoots the fur and feather he puts on canvass.

—Several hundred quail, intended for breeding purposes in France, got loose at the Sturtevant House on Monday night, and overran the establishment like the frogs of Egypt. They penetrated everywhere and were even found in the guests' boots that stood in the halls to be blacked.

—The quaint old city of St. Augustine, Florida, is being rapidly built up with expensive residences for northern gentlemen, who spend their winters in its delightful and healthy climate. Among the finest are those of Mr. Aspinwall and Mr. Henry Ball, of Ball, Black & Co., of this city.

—The Palatka (Florida) *Herald* mentions a farmer by the name of Futch who has been compelled to move to the other side of the St. John's River in consequence of the depredations of alligators. He says his cattle have been thinned out by an old bull alligator, which has been the terror of his neighborhood for years.

—Two of the edible dogs of China are now on exhibition at the Zoological Gardens in Paris. If it be found easy to acclimatize them, it is proposed to introduce this new article of food. The dogs in question are small and hairless and enormously fat. They are fed solely on vegetable food, a regimen which imparts a rare delicacy to their flesh.

—A passenger by rail, aroused from a serene slumber by the tooting of a whistle, exclaimed, "The train has caught up with those cattle again."

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

FANNIE ST. JOHN. Cambridge, Mass. Hurd & Houghton.

This is a pleasantly written historical romance by Mrs. E. P. Delesdernier. It opens with a lively sketch of the fortunes and misfortunes of the St. John family, who resided in the County of Orange, New York, during the Revolutionary War. The father was made prisoner and sent to Europe; the mother died and left several little orphans. About this time one Captain Gustavus Fellows, of Boston, took pity on the children and for poverty gave them a good home, and afterwards adopted them into his own family. Mrs. Delesdernier, who is a descendant of Captain Fellows, has written this graphic history with a view of perpetuating the memory of this eventful historic episode. It is handsomely brought out by the house of Hurd & Houghton.

Mrs. Mainwaring's Journal, a Story of Home Life in England. By Mrs. Emma Marshall. N. Y.: E. P. Dutton & Co.

This delightful pastoral romance will find a cordial welcome by the many admirers of this amusing authoress. Always improving, the marriage days from the beginning to the end, pass like a panorama before the mind; we find our sympathies going out to the writer; we share her joyous smiles in prosperity; we would comfort her in the darker hours of adversity; we fully rejoice at the golden wedding. To the wives and mothers of our country we would commend this work as one from which they may learn many lessons of faith and patience, and children lessons of grateful love for her whose love for them is never to be measured.

COUES' KEY TO NORTH AMERICAN BIRDS.

Of Dr. Elliott Coues' work upon North American Birds, we can truly say that, after much careful study and critical examination, we consider it the highest authority extant upon the subject upon which it treats.

From our previous knowledge of this subject, acquired by long years of careful study and observation of the peculiar habits (as a sportsman) of many species of American birds, particularly sea fowl, shore birds, ducks and the like, we find it perfectly reliable and correct in all its teachings of their peculiar habits, so far as we have had occasion to look for special information as to habits, &c.

The first sixty pages of this work will be found of so great value to the student of ornithology, as it is devoted to an explanation of bird life, that he will find indispensable necessary to a thorough understanding of this most interesting study. The elementary principles of this study must be thoroughly learned and correctly fixed in the mind of any one who would desire either profit or pleasure from the same. Failing in this the student had better abandon the work at once, close the book, and let the birds fly.

Let the ambitious student read and commit to memory what Dr. Coues here lays down as the fundamental elements of the science of ornithology, and he is on the sure road to success. This introduction prepares him to enter into the study of the Key to Genera with hopefulness. We shall further notice the other parts of this work more fully, as we have derived much genuine satisfaction and information from a study of the same.

ANNOUNCEMENTS.

SIMON GIRTY, The White Savage. A new historical novel. By Charles McKnight, author of "Fort Duquesne."

This work is, judging from the pages we have received, one of great and startling interest to all who love to read such stories as the "Pioneers" and "Scottish Border Tales." It reminds us much of Cooper, and opening as it does with the eventful period of 1778, all the incidents of the wars of that time, when the Tories fled from Fort Pitt to the British Indians, and up to 1794, when the rule of the frontier tribes was forever broken. To be published monthly in the pages of the *People's Monthly*, a magazine issued on the first of every month by the *People's Monthly Publishing Company*, Pittsburg, Pa. Price 25 cts. per vol.

It gives us pleasure to state that our old friends of the Riverside Press, Hurd & Houghton, have nearly ready for circulation a standard law edition of that popular and well known work, "Chitty's Law of Contracts," together with several volumes of Massachusetts Reports, and other works of a kindred character of great interest to the legal profession. They also announce "First Steps in General History," an outline work for schools, by Arthur Gilman.

This necessarily gives much labor to the enterprising publishers who, notwithstanding the work of their immense publishing house, have time to devote to many fine specimens of the rare and beautiful in unique book work. The work of the Riverside Publishing House bids fair to be favorable for the coming publishing season.

Messrs. Porter & Coates, Philadelphia, have in press and nearly ready a very elegant work by Mrs. Ellet—"The Queens of American Society." 8vo. Printed upon thick toned paper, with 13 steel engravings, and in addition to the value of its letter press, this work will equal any table book of the season yet issued. Judging from the specimens of this work, we have no hesitation in saying that it will prove a most acceptable accession to American literature, and find a place upon the center-tables of all our American ladies. In mechanical excellence it will be found a *dijou* of rare workmanship, which does ample credit to every department. We shall notice this at length hereafter. This rare work will be sold only by subscription.

Messrs. Porter & Coates have also in press a new illustrated edition of the Waverley Novels, with 48 steel illustrations in new binding, with stamps, expressly designed for this edition. Those who do not already possess this work in some form, will find the "Fireside Edition," as it is to be called, one having many claims to their notice, and they will find this superb edition deserving a place in every brary new without the celebrated works of Sir Walter Scott.

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

SIR:—A friend of mine sent me, with a transport
of Indian Skins, two pounds "Vanity Fair," which I declare
to be the best Tobacco I ever smoked. We have very good
tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair"
is the King of all, by its aromatic flavor and the right sort of
strength. My friend in New York got an appointment in
California, by that reason I apply immediately to you, begging
you to send me for the enclosed ten dollars, a supply of "Vanity
Fair," and send with the next steamer to Germany. If there
is a German firm that sells your excellent "Vanity Fair," I
beg you to enclose me the address.

**DR. FOWLER'S PATENT
HARD RUBBER REEL.**
"The Gem."

Imperishable, Light as a Feather, and
not Liable to Get Out of Order.

Numerous letters of recommendation have been re-
ceived from the most experienced anglers in America,
highly approving of this Reel, prominent among
which are Mr. Seth Green and the Hon. Robt. Roose-
velt.

This Reel, the latest contribution to the angler's
outfit has now been before the public for one year,
and we have yet to hear of the first complaint from the
many hundreds who have used it.

Sportsmen's Goods.

This arm was submitted in competition with over
one hundred different systems, American and Euro-
pean, to the Board of United States Officers, appoint-
ed by Act of Congress, 6th June, 1872, for the pur-
pose of selecting the best arm for the service, and of
which Brig. Gen. A. H. Terry was President. It suc-
cessfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for
the military service by all nations is only a question
of time; that whenever an arm shall be devised which
shall be as effective as a single breech-loader, as the
best of the existing breech-loading arms, and shall at
the same time possess a safe and easily manipulated
magazine, every consideration of public policy will re-
quire its adoption.

Resolved, further, That the experiments before the
Board with the Ward-Burton Magazine System have
so impressed the Board with the merits of this gun,
that they consider it as more nearly fulfilling the con-
ditions above specified than any other tried by them
or of which they have any knowledge, and it does
recommend that a number of magazine muskets be
made on the plan for further trial in the field." (See
Ordinance Report.)

We are now making these guns to supply the nu-
merous demands, and will soon have them in the
market.

The following is our scale of prices: Special Maga-
zine for large game, carrying from 3 to 8 cartridges,
70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10
lbs. weight, from \$60 and upwards, according to finish.
Special Long-range Magazine Rifle for Creedmoor
shooting, 90 grs. of powder, 480 grs. of lead, carrying
3 to 8 cartridges, weighing 10 lbs., from \$100 and up-
ward. Magazine guns for general use, carrying 3 to
9 cartridges, 60 grs. powder, 350 grs. lead from \$40
and upward. Single Breech-Loader, Creedmoor
shooting, for long range, 90 grs. powder; 480 grs. lead,
from \$60 and upward. Single Breech-Loader for
general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead,
from \$30 and upward. The calibre of all our rifles,
unless otherwise ordered, will be 45-100. in.

TIMES AND SEASONS.

SPRING is green,
Birds are seen
Tales of love relating;
After showers
Bloom the flowers,
Every bud dilating.
Everywhere
Birds must pair,
Happy be their mating,
Living, loving,
All the world is loving!

Summer glow
Lieth low
In the fields before us;
Hear just there
In the glare
Katydid's sonorous,
Up on high
Laughs the sky,
At the earth's dull chorus.
Living, loving—
All the world is loving!

Autumn sad
We have had,
All the leaves are yellow;
One and all
Let them fall
Death's a jolly fellow!
Summer dead,
Earth is red,
Every sunbeam mellow.
Living, loving—
All the world is loving!

Winter's here,
Bright and clear,
Pleasantest of weather;
See him stand
Tall and grand,
With his icy feather.
Young and old
Feel the cold,
Closely cling together;
Living, loving—
All the world is loving.

The Log of the Minnie.

NOTES OF A CRUISE DOWN THE ST. LAWRENCE IN A CENTRE-BOARD GIG.

CHAPTER II.

June 13.—Made an early start this morning, pulled out of the river, and found the wind fair but very light. Set sail and ran before it, passed Father Point, (the pilot station,) Great Metis and Little Metis, the villages now few and far between. About half past four in the afternoon we reached Matane, fifty-six miles from Rimouski, where another small river flows into the St. Lawrence. Entering this river we sailed and rowed up it until we got opposite the village where we landed. This was different from those we had stopped at further up the river, and instead of being agricultural, its interests were connected with the sea and woods. There is not much cleared ground round Matane, stores for supply of sailors, lumbermen and fishermen composed the chief part of the village. During the summer months ships occasionally load here, and a vessel was then anchored outside the bar taking in cargo.

June 14.—A light land breeze filled our sails this morning for about an hour, then it fell calm, and we rowed along shore intending to make Cape Chat in the afternoon. When we were some distance from it, however, an easterly wind sprang up. The wind was rising, and as we made little way beating to windward and had had enough rowing, we decided to turn back to a bay which we had passed, and which appeared tolerably sheltered. This was the bay Neichan, close under the mountains of St. Anne, "the highest land in British North America," according to our Guide Book, the sailing directions. They rise to a height of 4,000 feet, with a gradual slope from the edge of the river, and appeared covered with pine forests. Had we

had time we would have explored these hills, which would repay an expedition. The coast is wild and rugged here. There are few bays or harbors in which even a fishing boat would find shelter. Occasionally a few fishermen's houses are seen, where a ravine furrows the side of the pine-covered hills, and a mountain stream flows down into a little bay, but generally there are few signs of human habitation. Along this part of the coast, too, the bones of many a good ship are strewn, and during this day and the next we noticed several wrecks breaking up on the shore.

June 15.—The calm continued, though we had the land breeze for a short time in the morning. We rowed past Cape Chat, on which there is a lighthouse, and into St. Anne's bay, where there is a flourishing village, with church, fishing traders' establishment and store. The St. Annes River is tolerably large; it is leased, like all the salmon rivers of any size on the south shore. We put in here, and I went up to a farmer's house and got supplies. There is a little cultivated land around the village. Towards evening a light westerly wind sprang up, and we set sail and ran before it to a small bay called Bay St. John, about nine miles below St. Annes. There were a few fishermen's houses here, and though the shelter was not good, we decided to put in, as the wind was falling, the day advanced, and we were uncertain whether we would find a better harbor further on. The Minnie was accordingly brought to an anchor, and a fisherman took us ashore in his boat, and hospitably offered us his house. I had climbed up a little hill behind the settlement to look about, and C. had gone to fish, when a youth came up breathless with haste and excitement to tell me the surf was rising from the northeast, to which quarter the little bay was open. I accordingly ran down to the bay and found my friend the fisherman alarmed for the safety of my boat. "In another hour," said he, "you won't be able to see it on account of the sea." There was a surf breaking on the beach, but nothing to speak of. I got him and another man to launch their boat and take me over, put some of our gear on board their boat to lighten the Minnie and rowed her in, beaching her on the top of a roller. We had hauled her up above high water mark just as C. came up, wondering what all the fuss was about. The alarm was certainly needless, as the wind and sea did not rise, and we might have left our boat at anchor all night in perfect safety. We put up in the fisherman's "house," which consisted of one room, in which we all slept—our host and his wife in a bed in the corner, the family, consisting of four or five children, on the floor, and C. and myself also on the floor, as close to the door as we could get. We hinted at leaving this open, but to this our host objected mildly but firmly. This would have been too great a change in his domestic arrangements for a couple of strangers. Here we heard the first of a long series of complaints by the fishermen of the way the merchants and traders treated them. "They take the fish we catch and pay us for them in supplies from their stores at exorbitant rates; we are constantly in their debt, and always poor. *Is vous mangent, Messieurs;*" this was the constant burden of the fishermen's talk at the villages we stopped at on the lower St. Lawrence, and they certainly did not appear to be too well off. One of them remarked that the cost of our boat and outfit would be sufficient to buy up the whole settlement of Anse St. Jean.

June 16.—This morning being fine and calm, the whole settlement was up at the break of day and out in their boats fishing, hauling up cod as fast as they could bait and drop their lines overboard. We launched the Minnie and started under oars, went alongside and on board our friend's boat, and caught a few cod, then continued our course. We had not rowed far before a light westerly wind sprang up, which continued during the day, and blew off and on to the shore in flaws. The coast presented the same character as that we passed yesterday. We noticed three or four deep bays, the most westerly of which, Mont Louis bay, is a good harbor for coasting vessels. In the afternoon the wind increased to a stiff breeze, and blew down the ravines and cliffs in squalls; one of these struck the Minnie with such force as nearly to send her under, and we had to shorten

sail by taking out the sprit. About four o'clock we passed the Magdalen lighthouse and river, and were going on when the wind suddenly fell and chopped around. We then decided to put into the Magdalen river, and rowed up this stream till we came to a boom stretched across it. A good deal of "lumbering" is apparently done here, as we saw numbers of logs floated down to be sawed up and shipped off. We anchored near the mouth and slept on board.

June 17.—We had a fair wind to-day with a vengeance; started about four o'clock; it was now blowing a stiff north westerly breeze, and under mainsail alone we ran before it, passing fishing stations, boats at anchor, at a tremendous pace. As the morning advanced, instead of calming, as I expected it would, the wind increased, and at eight o'clock it came down in squalls in such force as to oblige us to take out the sprit and run under what the Canadian boatmen call our "pointer." Even with this small amount of canvas the Minnie rushed through the water at a great rate. In going around some of the headlands there was a very nasty sea, the big waves coming up after us would take the little boat on their crests and hurl it forward like a chip amidst their seething foam. The fishing boats had now run in for shelter, and at the fishing stations or villages we saw the people coming to their doors to watch our progress. We shipped scarcely any water, the lightness and buoyancy of the little craft being our safety. When the tide turned, about nine o'clock, the sea went down a little, but we determined to put in at the first well sheltered bay or harbor we came across, as it would have been running too great a risk to have attempted going round Cape Gaspé in such weather. We stood in as close to the shore as I dared go, and after trying one or two bays without success, and nearly bringing the Minnie broadside on to a sea in standing out again, we came upon a very well sheltered little harbor, rounded to inside a reef at the mouth of the bay, and C. took down the sail. Then we rowed up to a fishing stage and made fast to it. A party of fishermen had collected on our arrival and examined the little boat curiously and admired her. From them I learned that the place was Fox river, as we had not been able to follow the coast on the chart. It was ten o'clock when we arrived, and from measurement on the chart and from what the fishermen told us, we concluded that, following the coast line, we must have run nearly fifty miles in six hours, not bad going for a boat only sixteen feet long, though we had a strong current with us for the latter part of the run. The inhabitants of Fox river we found most hospitable in offering us a lodging. We selected an old fisherman's house close to the landing stage, and were well treated. Great Fox river is a fine little harbor for small craft, well sheltered from all quarters. At its east corner the river from which it takes its name flows into the bay. We tried this for fish and found it a failure. It continued to blow hard during the remainder of the day, and at night came down with such force as to make the wooden house of our host shake again, and cause me alarm for the safety of the Minnie. I was glad to see her next morning riding calmly at her mooring between the long lines of fishing boats.

June 18.—The summer gale continued during the morning but abated in the afternoon. We put off starting till next morning, however, as we wished to make one day of it to Gaspé. We took a walk along the road towards Gaspé, and admired the quiet beauty of the scenery from a point a little beyond Fox river; the village, the bay, the fishing boats, some at anchor in the bay, others with their white sails set, standing out to, or coming in from, their fishing grounds. A fine odor of cod pervaded the village, and we examined the mode of catching and preparing this noble fish.

The boats employed for fishing along the south coast of the St. Lawrence are called by the French Canadians "barges;" their usual size is about 23 feet in length by 6 feet 6 inches in width. They are open boats, good, wholesome craft, yawl shaped, full in the bows, and lean towards the stern, something like the fish they are employed to catch; they have a great deal of sheer, and are admirable

sea boats. They are sailed under two sprit sails, with sometimes a small jib, and usually manned by two hands. The lines, hooks and sinkers are of the commonest and strongest description. Two hooks are made fast five feet below the lead; herring or capelin is the bait generally used. Having reached their fishing ground, half a mile, more or less, from the shore, the boat is made fast to a mooring and the lines allowed to run out until the lead touches the bottom, then about a fathom of the line is hauled in, and if the fish are taking well, they are hauled up as fast as the fisherman can bait his hooks. When he has got his boat loaded he goes alongside the stage and discharges. The fish are split open at once, their entrails and half the back bone taken out, then they are salted and afterwards spread out on large tables or platforms to dry. This latter process is most troublesome and tedious; the fish have to be turned and piled together in layers in the evening, and on the appearance of damp weather, lest they become mildewed and spoiled. They are exposed thus for a month or so before they are sufficiently dry to be stored.

June 19.—This morning was bright and calm, so we hastened to get under weigh. After the strong west wind of the last two days there was a very strong current setting down the river which carried us on its back without much exertion in rowing on our part. When opposite "Griffin's Cove," a little harbor about six miles below Fox river, and very like it, a breeze sprang up from the northeast and appeared to be bringing up fog with it. Nevertheless we set sail and stood out northward towards Anticosti. The current was so strong that a comparatively short tack enabled us to weather Capes Rozier and Gaspé. The latter called "La Vierge" by the fishermen, is a bold, rugged cape, the cliffs steep for miles on each side of it. Going around this point we eased off the sheets and then booming out a sail on each side we ran up Gaspé Bay with a fair wind. I made the mistake of running past the entrance to the harbor, owing to too careful an observation of the chart, for I expected to see a light and observatory, which we were afterward told had been done away with some time before, and a light ship put in their place. After running up the northwest arm of the bay some two miles the water began to shoal, so we put about and rowed back, arriving in Gaspé harbor about four P. M.

Gaspé harbor is perfectly landlocked, and has the appearance of a lake, woods and green fields rising with a gentle slope from its calm waters. The town or village is built on both sides of the harbor, and at this time had a deserted look. At anchor in the harbor were two handsome yachts "La Canadienne," a schooner, and the "Nooya," an auxiliary screw schooner and yacht, belonging to Mr. Molson, of Montreal. About an hour or so after we arrived the Gulf Ports steamship came in, on her way up from Pictou, and I asked the Captain if he would take up my boat on his return voyage. This he kindly promised to do. The time I had allotted for my cruise was now drawing to a close, and I was afraid I might not be able to get the Minnie on board at the other places of call. The next day was cold and disagreeable. We remained at Gaspé, visited the craft in harbor, and came to the conclusion it was one of the duller places we had stopped at on our cruise.

June 21.—Prepared for sailing this morning, and rowed out of the harbor at ten o'clock on a cruise to the Malbaie river, about thirty miles by sea from Gaspé. We went on board La Canadienne as she was being towed out of the harbor by a boat, and were hospitably received by her pleasant, genial captain. An unfortunate accident had occurred about three weeks before which threw rather a gloom over the ship. One of the boats coming across the bar of Grand river, at the entrance of the bay Chaleurs, was capsized, and the sailing master and three of the crew drowned. Leaving the schooner we set sail, rounded Point St. Peter, and stood up Malbaie with a northwest wind. On coming to the entrance of the river we found a tolerable surf on the bar, as it had been blowing hard from the eastward the day previous, and not wishing to meet with the fate of La Canadienne's unfortunate boat, we took in our sails and prepared to cross it under oars. Our first attempt was unsuccessful. We got across the bar all right, but the strong current setting out from the river caught the boat's head and nearly turned her broadside on to the rollers. C., with a few vigorous strokes, brought her head to sea, and then we backed in stern foremost. A heavy roller carried us in with a rushing surge, and turning the boat we rowed up to a village close to the mouth of the river, called "Barachois," from the bar at its entrance. We had been watched from the shore and the fishermen gave us "kudos" for the management of our boat when they found we had come in without shipping any water. None of them had been outside that day. We went two or three miles up this river and camped, remaining there three days fishing for trout. On the 24th we rowed down; had no difficulty in crossing the bar this time as it was nearly calm; then we took a cruise round the Perce rock, a curious rock about 200 feet high, steep and abrupt as a piece of wall, and looking as if split off from the neighboring cliff by the blow of some stupendous axe and left in the sea close by. Close to its outer side is a large hole, through which, at high water, boats can sail. This was the furthest point we reached in the Minnie. According to our estimates, and from measurements of our course, nearly 550 miles from Quebec, 430 nautical miles on the chart. We returned to Gaspé on the 25th, running up the bay with the sea breeze.

Next morning I shipped the Minnie on board the steamship Secret, took her to the Point du Chêne, and from thence to Halifax by rail, where she arrived none the worse for all her wanderings, and the owner a good deal the better for his cruise.

C. U. D.

HALIFAX, February 18, 1874.

A HUNT ON SENECA RIVER.

For Forest and Stream.

ONE beautiful autumnal morning last October a party of three gentlemen sportsmen, "armed and equipped as the law directs," were to be seen briskly tramping along the railroad track eastward from the little village of Savannah. They had arrived on late trains the previous night, from neighboring cities, and their destination was the Seneca River, some two and a half miles distant. The elder of the trio will answer to the name of "the Elder," Ben and Chad being his companions. The beautiful fresh morning air had invigorated them, and they were in exuberant spirits, and in anticipation of glorious sport among the ducks. They had no dogs, choosing to flush their own birds and swim themselves in order to recover birds, if necessity compelled.

Striking off from the railroad towards a piece of woodland beyond which a marshy meadow expanded, our sportsmen began to hold their double shooters in shootable shape, and casting eager and expectant glances to the right and left flanks and dead ahead. Ben and Chad sought each other's companionship on the march, while the Elder acted as flanker. Soon after the meadow was reached up went a fat lively snipe directly in front of the Elder, but before he had made a half dozen evolutions of his shiny wings, they were riddled by at least a half ounce of No. 8 shot, a very dead bird. First bag for the Elder. Ben and Chad witnessing this first exploit now advanced with great caution in perfect readiness. Whirr, and up go two more snipe, but out of range. They very soon went to earth, and the two sports went for them. Nearing the birds they exercised very sportsmanlike caution and discretion. The birds flushed beautifully and bang, bang, bang was reverberated over the meadow in quick succession, but not a feather was raised; "missed slick and clean every shot, Ha! Ha! Ha!" roared the Elder. "You are fine cubs to go shooting. Do not believe you could hit the broadside of a barn." "The laugh may be on the other side of your mouth soon," said Ben, sullenly, which alas, proved too true. In endeavoring to cross a marshy slough a few moments later, the Elder missing his footing on the firm bogs, suddenly disappeared below the tall grass, and with difficulty extricated himself from the soft mud into which he had sunk nearly to the waist. All begrimed with mud and water the Elder presented a pitiable sight. "Ha! Ha! Ha! old man, you are a nice one to hunt snipe on a marsh," was chorused by Ben and Chad. "Do not you know any better than to try to cross such a place as that? Why you might have gone under head, ears, gun and all." The Elder was forced to join in the laugh, and our friends were soon trudging along in the best of humor, notwithstanding mishaps.

Arriving at the river without further occasion to use gunpowder, and with no repetition of the slough adventure, they approached a log shanty near the banks of the marshy Seneca, and soon negotiated for two boats with the necessary appendages thereto. Ducks were to be seen in every direction, and our sportsmen were on the *qui-vive*. A steady pull of ten minutes brought the boats into the immediate neighborhood of hundreds of ducks, some flying high, some low, and some floating lazily along upon the placid waters. Ben in one boat and the Elder and Chad in the other, they endeavored to play into each others hands by driving, but this did not work as well as they anticipated. It was apparent that the ducks were up to snuff, and knew to a nicety how near they could allow the boat to approach before taking wing, and how near they could with safety approach the boat when on the wing. The sharp crack of the guns reverberated from shore to shore at short intervals, but not a duck could be brought to bag. The Elder and Chad seeing three large black fellows leisurely sailing along on their weather beam, tacked and as stealthily as possible made for them; Ben seeing their movement made a flank advance. When at long range the Elder's gun spoke to them just as their wings were spread to fly, resulting happily in wounding one which soon came to water. Ben's right now sent forth its missiles of death, then Chad's left, but still the ducks swam. Gaining a nearer range, however, Chad's right ended the fray and the poor bird was bagged. Four shots at one duck! too bad, too bad. The explosion of gunpowder was extravagant during the entire day, and when the shades of evening approached, a black duck and two coots made up the sum total of reward. By this time our friends began to think a good deal about eatables and bibables, and not quite so much about ducks. They discovered that they had wandered considerably from their point of embarkation, and the only course for them to pursue was to seek a place of shelter as soon as possible.

At the first eligible landing place they drew their boats high upon the sand, hid the oars and struck out inland in quest of such a haven of rest. A saw mill was the first building they encountered, and the next the miller's abode. Upon making an application to abide with him over night, the miller readily assented, at which the trio were much delighted notwithstanding the very uninviting surroundings of the place. A small slab shanty with three rooms sparsely furnished with home-made furniture, the rooms neither lathed, plastered or ceiled, along lank red haired man with sharp features, and very ignorant, who had the appearance of having been born and reared in a saw mill, a sickly looking small woman with black eyes, also void of "book learning," four or five children ranging from a seven months old baby in the home-made cradle, a boy of eight or nine, who by the way was having "the ager" right smart, a dog pup, a cross between a bull and something else, and a large Tom cat, both of which latter had the perfect free-

dom of the house, and you have a partial description of the surroundings. Supper, which was very, very simple, was prepared so speedily that our friends could scarcely find fault at being kept in waiting. Ben exhibited unmistakable signs of daintiness, sipping his tea and eating of a little bread very sparingly. His companions rallied him upon his sudden loss of appetite, to which he returned evasive replies. He had shown himself to be blessed with splendid advantages for making away with victuals at previous meals, and the Elder and Chad wondered at his sudden loss. The explanation soon came, however, when the guests had retired out of ear-shot of the hosts. Did not you see that woman go and get a sheet off the bed in the next room and spread it on the table, says Ben? This was explanation sufficient, and his two companions motioned him with teeth firmly set, to forego any further remarks. At an early hour the tired duckists were shown to a bed, just one bed in one little room 8x10, a very small bed made expressly to fit the room. After drawing straws for position, the Elder was packed in against the wall, Chad was placed in a very straight attitude in the centre, and what room then remained Ben accepted with a very good grace. About two hours were devoted to the narration of brief anecdotes which were silently listened to by the hosts in the next room, when it was remarked that there was a very unpleasant odor about the bed. Hens, ducks, turkeys and other birds' feathers and quills had apparently been used in its make up, and evidently while in a very crude and uncured state. If there is one thing more unpleasant than another about a bed, it is the stench arising from green feathers. Ben with a cry of "more oxygen, more oxygen," jumped up and raised the lower sash to its extreme height about a dozen times, and the night being rather cool would force him to lower it every ten or fifteen minutes. It is useless to add that sleep was almost a stranger to the guests of "Howland Island House" that night; when the first faint streaks of dawn appeared Ben was up and dressed. The room being on the first floor front, he proceeded to make his exit in search of "more oxygen" through the window. Chad upon turning himself over caught sight of Ben's lower extremities in a horizontal position stretching out from the window sill and immediately seized them with a hunter's grasp. The lower extremities kicked, the loosened lower sash slipped from its position striking first on Chad's pate, thence on the said lower extremities, and finally found a resting place on the bare floor with a crash peculiar to falling window sashes. The Elder who before had been in a troubled sleep now sprang up demanding the meaning of all this clatter. Ben having in the meantime released himself, now besieged the inmates of the room with a ten foot rail through the open window, and the Elder in plaintive tones was obliged to beg of him to "cease his raillery" ere the besieging party would consent to withdraw. This ended the first day's hunt on Seneca River.

We will reserve the recounting of the second day's adventures for another letter. Yours,

MUZZLE LOADER.

For Forest and Stream.

FLORIDA SKETCHES—YACHTING DOWN SOUTH.

THE last sketch left us tied to the few remaining posts of an abandoned pier for the night. These piers are often carried a long way into the broad river before reaching water of sufficient depth for a steamboat, so shallow are many of the bays, and they do not endure long in a climate where heat and moisture expedite decay, and where under water various borers are ever at work running their galleries through and through even the gummy pitch pine logs.

With some ingenuity very comfortable beds were improvised from cushions, rugs, etc., and despite the hot breath and loud respirations of the furnace and boiler, very near our heads, we made out a comfortable night on our steam tug. At daybreak a fog hung over the stream, and we were forced to await its clearing. It did not delay long, but rolled away like a curtain, and opened a morning view of the scenes that we were so reluctant to have overshadowed the night before.

Our cook was busy in a caboose a little smaller than a watch box, from which drifted a fragrant odor of Java as we came on deck and freshened up in pails of clear water, and ate our fruit before breakfast. We were drifting along with summer all around, air, water, and sky all full of warmth. Our will our law, to go, to stop, hasten or linger as we fancied at the moment, and, in unison with the soothing influences of the scene, we gave ourselves up to vigorous idleness.

After our meal, as our crew was small, your correspondent took the wheel while the captain enjoyed his breakfast. The pilot house was low and open. Just in front, in easy camp chairs, sat the rest of our little party smoking, with their guns on a cable box in front, all of us feeling little interest in getting anywhere, the one fact of gliding along amid slowly varied scenes being sufficient. It was indeed luxurious. Our black imp was at hand to respond to every wish and attend to every want that might have caused greater exertion than winking, and we were convinced that man's natural bent was laziness, from the very rapid and complete surrender of three hurrying, worrying, nervously active northerners to the abandon of the sunny south.

There was but little game in sight as yet. We were on the highway, where from the forward decks of every steam-

er a fusilade of small arms is kept up on every living thing, from alligators to the useful buzzards that clustered upon the floating carrion. Every man and boy feels called upon to do some "sporting" in Florida, and all are armed with as varied a lot of guns and pistols as would adorn an arsenal. The rapid movement of the river boats prevents any very serious results to the animals and birds, unless when now and then the ricochet of a ball kills a cow in the woods; but it amuses all but the timid people, and is a custom of very great value to the Union Metallic Cartridge Company.

The birds seem well informed as to the range of modern arms. The stately and beautiful snowy herons spread their white wings only when rifles are raised, and the less beautiful alligator seems to know just when to launch himself to save his scaly sides from harm. The animal life of the lower St. John is not of the simple kind, but the denizens of this Broadway know a thing or two, and are not to be taken in by any cheap tricks. Consequently our guns were idle, and nothing aroused us from the quiet state of enjoyment that is so valuable to the strained minds that have been keeping pace with the restlessness of northern life.

Above Palatka the river becomes less lake-like. There is more perceptible current, and it bends and drifts by islands, when the channel being nearer the shore more of the forest is seen. Unbroken woods and ranks of tall stems come quite to the water's edge; indeed, the huge cypress trees stand in the margin, and surrounded by the pointed upward roots, rising from one to four feet high, called knees, they give a novel appearance to the ground, while overhead the long grey drapery of Spanish moss adds an impression that these are bearded woods of unknown age, hoary and ancient as Druid oaks. Fresh and bright are the grand magnolias, every dark green leaf polished until they are silver in the sunlight, and as a new form to the northern eye the tall palmettos raise their tufted crowns of huge leaves. On dry ground the live oak assumes superb proportions, its low spreading form and broad shade being in grateful contrast to the rigid formality and upright lines of the southern pines, so abundant and so monotonous. Beneath these trees is a varied and interesting growth of forms very strange in contrast with the small thin undergrowth of the north. The huge leaves of the cabbage palmetto, five or six feet in diameter, are very handsome with their crimped fan-like radiating form, and the saw palmetto shrub is very similar. A wealth of small growth and vines is mingled in the green tangle, while parasitic plants, mistletoe, and air plants form mid air clusters foreign to any our hardwood hills present.

The evening of this day found us at Lake George, where we were anchored far enough from shore to avoid the mosquitoes. Rising at early dawn we found ourselves surrounded by myriads of ducks, covering the water, and looming up in the distance like low islands. Our skiffs were launched, and various strategy called into play in efforts to reinforce our larder with their plump forms; but it was calm and clear, and they were not to be caught napping. A few were shot from the tug when bearing down at high speed, and among the islands smaller flocks were more easily surprised.

Anchoring in one of the unfrequented channels among the islands, part of our company went into the woods, while your correspondent took a light skiff and a boatman and explored one of the deep dark channels that make far into the wilderness. The entrance was among the lilies, called bonnets by the natives. Here and there lay alligators, eyeing us wickedly, and they were far more bold than in the main river. On the low points, resembling the spirituelle as completely as the alligators represent the infernal, were stately, snowy herons, the most beautiful feature of all this sunny land. Following the dark thread of water through a profusion of semi-aquatic growth, we entered the forest until it overreached the narrow water, and was, in all its beauty, repeated in the calm flood below. The long grey moss hung almost to its reflection, and in the long vista all mingled into a confusion of waving form and shadow that concealed the water line, making a scene as indefinite and unreal as a dream. All kinds of birds and animals fluttered on before us or stole away into the woods. The grotesque snake birds, or water turkeys, wriggled and stared, and then tumbled off their perches with a helpless splash into the water as if overcome with astonishment, and would next be seen with two or three inches of snake-like head and neck, going rapidly by. Precisely do they resemble a small swimming snake, and one can hardly believe that there is so large a bird under the surface. At the end of this stream, in the dim light that found its way through the huge leaves, we came upon a congress of owls, assembled beyond doubt in the mysteries of some ancient order of Minerva, and never was so much wisdom so solemnly arrayed. Silent, dignified, and conservative, doing nothing lightly, committing themselves to no unmaturing ideas, even and temperate, what body could equal them? I had seen less manifest self-respect in the great and august men who eat pea nuts in the beautiful chambers at Washington; and even the negro policemen at Charleston were not more staid and haughty. I was awed, and felt myself an unwarranted intruder, but longed for the skill of the artist Beard to bring from this midwood court a record of sage and ancient conclave that, as wigs and ancient digni-

ties become obsolete, we might see what in the evolutions and natural selections of a new Darwinian day may give us a new and more wise race. Silently we gazed mutually; on my part a conviction of trespass became uncomfortable, and I was about framing an apology in long words of Greek derivation when the grey wings opened and the whole party flitted silently away, merging into the smoke colored moss like a transformation scene.

Life abounds in these retreats. Here the wood duck winters in solitude, curlew sweep along in flocks, coot and rail run among the sedge, deer come shyly down to drink, or frightened by the puma plunge in and seek refuge in swimming. Under the bonnets are voracious, wide mouthed bass, called trout by the natives, who know not our clear northern waters nor the bright-hued fish that enliven them; and when the sun is bright huge gar fish, or alligator gar, long nosed fellows, bask near the surface. Near springs where the waters are clear the study of aquatic life is very interesting. In one such stream, with a bright sandy bottom I saw more varieties of fish than I can describe or name. Among them in groups were fish like pike, from one to two and three feet long. The gar were abundant, and four to six feet in length, going off like arrows, and leaving a swirl like a propeller. In deeper spots clustered bass, a spotted fish I could not learn the name of, and fish called silver fish, while flitting along like bats, raising little clouds of sand with each stroke of their liver colored wings, were electric rays, or stingarees. Under our boat, too, undulated the water moccasin, eyeing us angrily, and darting out a forked tongue most viciously. At another time, in one of these bayous near Enterprise, while paddling along, I shot a small alligator, some four feet long. The ball tipped and cut his skull, and, as my excellent boatman July said, killed him. Poking him up from the bottom we took him guardedly aboard. He was seemingly very dead, so his shiny form was placed under the bow deck, over which I stood shooting at gar fish, hoping to get one. I had forgotten the fellow, when I was astonished by a smashing under my feet, and with a jump over July made my escape into the stern, where a lady was sitting, just in time to save my legs from a rasp of his well aimed tail. Out he came, smashing and spoiling for a muss, his long mouth open, and an unpleasant look of mischief in his bloody head and eyes. There were just then some amazing ideas suggested. Jumping overboard was going from the alligator frying pan into a fire of sting rays, electric eels, and moccasins. Shooting him was a pleasant and revengeful idea, but it meant blowing a hole in the bottom of the boat. The old story of the natural histories reminded me that it was the proper thing to jump on his back and hold up his fore legs; but I was at the wrong end of him, and riding one without a saddle is not a thing to do even with the spur of necessity. It was rather close. The boat was not as long as we wished it was, and we had exhausted our retreat, but, master of the situation, he waddled on with an air of conquest and extermination until July met him bravely and punished him with the butt of an oar until he was again stunned. We had lost confidence in killing him, and to be safe tied him overboard and towed him to a landing, where he recovered his fine disposition under a system of annoyance from all the visitors, and finally gave evidence of it by biting a man. When I heard this I said nothing of his being my pet, and due justice was meted him.

Injury from alligators is very uncommon, but they are at times very fierce. A gentleman going to recover a duck shot on the upper St. John saw an alligator seizing it, and poured a charge of shot into his head, when the injured and infuriated beast turned and bit a large piece, gunwale and all, from the skiff. Their power is very great, and when wounded they give evidence of it, thrashing and crushing all about them. I shot one through the head on Six Mile Creek, and he leaped from the ground until he looked as high as a horse. Heavy and awkward as they seem, they are not to be approached unguardedly, and although always ready to escape; if prevented they are very vicious.

But I have wandered far from our tug, to which follow me back, and listen to the echoes to the long whistle which I sound to guide the party in the woods. They soon return, and nightfall finds us again merry in the little cabin.

THE PIKE-PERCH IN LAKE PEPIN.

THE pike-perch, (*Stizostedion Americanus*), is in this lake one of the most noted game fishes, and is inferior to none other for the table. The habits of this fish seem to be well known to most writers, but I am persuaded that with this as with some others, their habits differ somewhat in different waters. All agree that they spawn in April, but I have known them to spawn in this lake as early as the 15th of March; I think, however, this is not always the case. They choose for their beds clean sandy (not gravelly) bottoms in shallow water, from two to six feet deep. As soon as the lake freezes over they commence looking for suitable spawning grounds, and having once selected, and "pre-empted" them there, they remain until the spawning season is over. This is a singular and interesting fact, and one of which I have not the least doubt. The pickerel is their great enemy and sometimes succeeds in "jumping" their claims. The spawning grounds here

are as well known to me and other observers as the position in the heavens of the north star. These fish are taken very late in autumn, but never on the spawning grounds until the lake is frozen over. You may visit these grounds one day and not discover a single fish, but should the lake freeze over the same night, then the next day, if the ice is sufficiently strong to hold you, you may pay these grounds a visit and find plenty of pike-perch. This I have known to be the case time and again. And I know that they remain right here, fighting off every other fish, except the pickerel, who is their enemy and master, until the spawn is deposited in the spring. Hence I conclude that they select their spawning grounds as early as November and December. This singular fact has interested me very much for years. As soon as the young brood is able to take care of itself, it strikes for deeper water, remaining together as a family and not commingling with others. For weeks they remain so closely together that a half bushel would easily cover the entire brood. I have seen thousands of these families so near together that many would suppose them to be a regular school, yet every brood separate and distinct from the others. I have seen large fish dart at them, when they would endeavor to fly away together, no one leaving his kindred until the affectionate family is scattered. Even then they will make an effort to re-unite, but no doubt some of the little fellows have been forever separated from the family circle. They will thus remain together during the whole of the first season, unless broken up by their enemies. These observations have many times intensely interested me. I am aware however that this is a habit characteristic of the young broods of some other fish, especially of the *Labraces*, or basses. The *habitat* of the adult, or if you please, its accustomed feeding grounds in summer, has been a more difficult matter to determine. In running water I should look for them exactly where I would look for trout; but in lakes they seem to remain in no one place any length of time. As long as I have angled for these fish here, I can never determine before hand where I am going to find them. The same pickerel and bass grounds hold good year after year, and we always know what to expect when we visit these places. Not so with the pike-perch. One day you will find them near shore, next in deep water, and the next at the mouth of creeks or sloughs. The most are caught off the ends of points in ten to twenty feet of water. Sometimes they are found very near the shore rolling and sporting in the waves. In this case the bottom is always gravelly and stoney. They seem to abhor an abrupt rocky shore. Once my friend Mr. Gibbs struck a large school (they seldom are found in schools) sporting in huge waves so near the shore that his cast could reach them with ease. The wind was blowing (in shore) a regular gale, and the water, when still, could not have been more than two feet deep. They seemed to be holding a jubilee, but, poor fellows, destruction overtook many of them, and those that were left must have mourned for their brethren "for they were not."

With the brook chub, (*Moxostoma oblongum*), for bait, Mr. Gibbs took, in a little over an hour, so many that he was obliged to get a wheelbarrow with which to take them home. The load was so heavy that he was actually obliged to get help before he could reach his house three-quarters of a mile distant. When I have heard him mention this trip he would puff and blow as though he was living the scene over again. Frequent and subsequent visits under like circumstances, to the same locality, have failed to find the fish. Owing to the uncertainty of their feeding grounds, not a great many of these fish are usually taken in the summer season. Sometimes we take them with the spoon trolling, but as they are a bottom feeding fish, they are more generally taken with minnow or piece of fish still fishing.

I have taken a number with the fly; it must be gaudy, larger than a bass fly and shot with a buckshot put on as near the head of the fly as possible. As soon as the lake freezes over the slaughter of these fish begins right on the grounds selected for spawning. They are taken through the ice by the thousands, and the slaughter continues until the ice is gone; by this time the breeding season is over, and what were not taken by the hook have departed to other waters and resumed their roving habits. Live bait only will answer for winter fishing. Some of these fish attain a very large size; the largest I ever caught weighed fourteen pounds, but I have seen them weighing twenty-two pounds. I once found a dead one on the shore that was a monster, he must have weighed thirty-five or forty pounds. As a trophy I dissected out the lower jaw and have it now in my cabinet. It is over eight inches long and spreads at the angle nearly seven inches. The teeth are terrible, quite an inch long, and as sharp as needles. Naturalists and anglers examine this specimen with great interest; will try and keep it until you visit Lake Pepin.

D. C. ESTES, M. D.

Lake City, February 28, 1874.

—The trustees of the Museum of Fine Arts of Boston have accepted an offer of the Duc de Montpensier to lend fifty-five pictures, valued at \$500,000, to the Museum for one year, from the 1st of May, 1874, to the 1st of May, 1875. Among them are five of Zurbarra's master works, a Murillo valued at \$100,000, which has never been out of Seville excepting for eight years, during which it was in the Spanish gallery of King Louis Philippe at the Louvre; a Holy Family, by Sebastian del Piombo; two pictures by Velasquez, and other superb examples by such great Spanish artists as Herrera, Juan Valdes Leal, Ribalti and Morales.

For Forest and Stream.

DESPAIR.

THERE comes an hour, a bitter hour,
When life is dark and drear,
When Faith and Hope and Love itself,
Are powerless to cheer;

When gloomy thoughts oppress the soul,
And choke the founts of mirth;
When memory is but remorse,
And hope expires at birth;

When far away from friends and home,
Your lonely bark you steer
Upon the ocean's wilderness,
With not a true heart near;

When from the anguish'd heart despair
E'en brief oblivion snatches—
You find the soothing pipe and weed,
But ah! you're out of matches!

J. J. ROCHE.

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

IS THE YELLOW PERCH (*Perca flavescens*) A GOOD FISH TO INTRODUCE INTO CALIFORNIA?

I SHOULD like to ask those who are so horror struck at the prospect of introducing yellow perch (*Perca flavescens*) into the State of California whether they suppose that any given fish is the same in quality all over the world, or that the yellow perch is a poor fish everywhere because it happens to be where they have known it. If they do, I advise them to take what spare time they have and read themselves up in natural history. They will then find that it is one of the most common facts of natural history that fish, as well as food and fur yielding animals, vary almost indefinitely in quality with their habitat. Why does not the fur of a California mink bring as much as that of a Labrador or Lake Superior mink? The reason is obvious. The climate of California does not produce such good fur as the climate of Labrador or Lake Superior even on the same animals. It is exactly the same with fish. Different climates, and especially different waters, produce fish of entirely different qualities, though of the same variety. The bass of our southern waters is not the same as the bass of Saratoga Lake and Lake Champlain, but a far inferior fish. So with the yellow perch. In some warm waters it is a poor fish enough, but it is not so in the cold, pure lakes of New England or northeastern New York. I will agree with my friend Mr. Mather, if he insists upon it, that the yellow perch that he is acquainted with is a miserable fish, and not fit to take to California. But the yellow perch of Saratoga Lake and Lake Champlain and Monadnock Lake, in New Hampshire, is an entirely different thing. Mr. Mather must come and eat some of them before he puts them down so summarily. If he will, I have no doubt that he will also agree with me that the yellow perch of these localities is a very sweet, firm, and excellent fish when in season. I am not sure, if he should eat some Saratoga Lake perch off the table of my friend, Mr. Moon, that he would not say the yellow perch was about as good a fish as he had ever eaten. Any one who is in the habit of going to Saratoga, knows Mr. C. B. Moon, of the Saratoga Lake House, the reputation of whose game and fish dinners is world wide, and no one who is acquainted with Mr. Moon and his dinners can have a shadow of a doubt that he is an unimpeachable judge of the qualities of game and fish. I wrote to Mr. Moon for the purpose of getting his opinion of the merits of the yellow perch, and he sent me the following reply:—

SARATOGA, January 30, 1874.

MR. STONE, Dear Sir:—Your letter is arrived, making inquiries in regard to the yellow perch. I use a large quantity of these fish every season. I consider them a most excellent fish indeed. Many of my customers at the lake give them the preference above all other fresh water fish on account of their sweetness and flavor. They increase rapidly when introduced into good waters, and I am sure they would be a hardy fish to ship, and any section of the country might well feel glad to have them introduced.

Yours truly,

C. B. MOON.

Now, as to the actual charges against the yellow perch, that they are "bony and predacious." I say, what of that? The shad is very bony, but a capital fish nevertheless. The brook trout is more predacious than the perch, but he is the king of fresh water fish nevertheless. Saying that the perch is bony and predacious does not make a case against him. The question is, whether these disadvantages affect his good qualities? I think very decidedly that they do not. I reaffirm that the yellow perch of northern and northeastern waters is a very sweet and excellent fish when in good condition, and people must call them worse names than bony and predacious before they can put them down.

Besides possessing edible qualities of an excellent character, the yellow perch has other merits. It is a hardy fish, and can probably be introduced successfully where other fish would fail. It is very prolific also. Not but that other fish are equally so, but the eggs of the yellow perch will hatch under circumstances that would be fatal to other eggs, so that the perch is, in consequence, practically more prolific than other fish. It is also exceedingly easy to hatch the spawn of the yellow perch artificially, which is another advantage.

If this is not a sufficient vindication of the attempt (which, by the way, I would have it understood, had the full sanction of the California Fish Commission) to intro-

duce the yellow perch into the waters of the Pacific slope, let me add that it is at all events far preferable to most of the fish at present existing in the fresh waters of California, and even if it destroyed four fifths of the other fish there it would replace them by a better kind.

For instance, the fish of Clear Lake are (I give the local names, for I do not yet know the scientific names) the California salmon trout, white perch, shapaulle, hitch, suckers, chly, roach, spotted sun fish, mud fish (mud suckers), black fish, trout, bull heads, viviparous perch.

The fish of the Sacramento River are trout, salmon, chubs, perch, hardheads, Sacramento pike, viviparous perch, split tails, suckers, herrings, sturgeons, crabs, lamprey eels.

The varieties contained in the waters of these two localities comprise most of the fresh water fishes of northern and central California, and I think it is safe to say with the exception of the salmon and trout, and possibly the viviparous perch and black fish, which latter is quite rare, that there is not one of these fishes that is superior to the yellow perch of New England and northern New York, which it was proposed to take to California.

I would like to hear the other side of this question from those who disagree with me, but until they make out a better case than they have done I shall continue to think that the *Perca flavescens* is a very desirable fish to introduce into California, and that the fish commissioners of that State are right in upholding its introduction.

LIVINGSTON STONE.

THE FISHWAYS OF PENNSYLVANIA.

[Read before the American Fish Culturists' Association.]

BY JAMES WORRALL.

SOME attention having been drawn to the Fishways constructed in the Columbia Dam, on the Susquehanna River, in the State of Pennsylvania, in consequence of the fact that no work of the kind as yet erected in the United States has been known by ocular demonstration to have permitted shad (*Alosa Prastabilis*) to have passed through it, and having been connected with the Pennsylvania Fishways from the commencement of the restoration movement, the undersigned hopes that a few words in the form of a paper, to be read before this Association at its present meeting, will not be uninteresting as an endeavor toward the establishment of the facts as they have occurred.

The restoration movement in Pennsylvania originated in a Convention of citizens, most of them riparian to the Susquehanna, which assembled in Harrisburg early in 1866, and while the Legislature was in session. A bill was drawn up in this Convention which subsequently became a law, requiring Fishways to be erected in the dams of the Susquehanna and its tributaries; containing other provisions for the restoration and protection of the fisheries; and providing also for the appointment of a Commissioner who was required to be a civil engineer, whose duty it was, amongst other prescribed duties, to plan and have these fishways constructed. It so happened that vested rights precluded the erection of fishways in any dam on the river except the Columbia Dam; so the Commissioner's attention was exclusively confined to the Columbia Dam. The undersigned was appointed Commissioner, under the act, by Gov. Curtin, and immediately proceeded to the performance of his duties. His only qualification at the time of his appointment was derived from his experience as a civil engineer. He did not know the form required for such a structure, although he believed himself competent to construct the work as soon as the form could be ascertained. The only successful fishway at that time known, was the Foster Fishway, and to that, therefore, his attention was naturally directed. Most, if not all the Foster Fishways at that time constructed protruded from the dam down stream. In considering the form of a fishway which would invite shad to pass through it, after enquiry amongst experienced fishermen and river men, the undersigned considered the Foster ladder decidedly objectionable, for he ascertained that shad moved much more frequently in schools and flocks than in pairs or small numbers. He made up his mind then that the true form for shad should be capacious in size and as gentle as possible in inclination. Further, that it should be so located as that it would be easy to find. All these views indicated a cutting into the dam rather than a gradus or ladder below it. He was strengthened in this view by advice received from Mr. Daniel Shure, at that time Superintendent of the dam, and from Major George M. Lanman, (now deceased,) who had been engaged in its construction originally.

Advice was sought on the subject in Massachusetts also, whither he repaired and consulted with the Fishery Commissioners of that State, but especially with Col. Theodore Lyman. This latter gentleman stated that he believed an inclination of 1:10 would be overcome by the shad, but agreed otherwise with the undersigned as to the form of the fishway. Returning to Pennsylvania, Mr. Shure was consulted again, who also recommended 1:10 for the slope. The inclination of 1:15 was however eventually adopted, and a simple trough cut into the dam forty feet wide at its mouth, narrowing to twenty feet at its inlet by means of three or four rectangular offsets; these being the suggestions of Mr. Shure, who believed that they would create eddies and resting places for the fish, should they fail in gliding through the whole chute by a single impulsive movement. The rise to be overcome was about three feet,* and the length of the fishway was consequently forty-five feet, obeying the inclination of 1:15. The width of the chute was considered very small by the undersigned (only forty feet in six thousand eight hundred, the length of the dam,) but its cost was to be about \$5,000, and the whole affair being but an experiment, he hesitated in putting the owners of the dam to a greater expense than that for a mere trial of a principle. He felt sure that a few fish would ascend the chute and these would soon cause a feeling in favor of the system which once established would eventually induce the Legislature to make ample appropriations for more extended works. Thus also the fishway was located near the off shore or right bank of the river, in expectation

*The dam is six feet high, but the floor of the weir is two feet below the top of the dam, and its lower end one foot above the bottom of the dam.

of having another closer to the high shore or left bank. The work was finished in 1866. In 1867 it was looked to with great interest by a few friends of the measure, but it was treated with ridicule by most others. The winter of 1866-7 caused an abrasion of the dam, and this aiding the fishway, produced a considerable run of shad above it so that a very fair catch was the consequence. This circumstance helped the reputation of the fishway no doubt, nor has that fact ever been denied.

In 1868 the catch was not so great, for there was no abrasion, but the catch exceeded the average of former years and so matters continued, the catch always increasing till 1871-2, when the extraordinary catch estimated at some 100,000 as against ten, twenty and thirty thousand in ordinary seasons occurred on the Susquehanna below the dam.

Fishing was prohibited by the law of 1866 within half a mile of the dam, but local pressure in the Legislature repealed the prohibition, and since 1867 fishing has been allowed nominally to within 200 yards of the fishway, but actually there has been no prohibition as to distance, so that it has endured the most adverse circumstances. A good catch however was made above the dam in 1871-72, and from that year onward the river has been regarded as having been partially reinstated in its fisheries.

New "batteries" have been prepared below Columbia by men who, having but small capital, would not have invested in them had they not believed that the chances for remuneration were very much improved.

At Newport, on the Juniata, fifty or sixty miles above the dam, since 1867, a steady increase has been observed, and in these neighborhoods no one believes otherwise than that shad in greater or less numbers may be confidently expected every year.

At Newport, in 1872, the catch was quite small, but that is the only year since 1867 in which a decided increase has not been observed there. This however arose from local causes. The river at their fisheries was too low during the whole season. The fishermen saw the fish but could not catch them. But the series of increments met with no real break, for at Sunbury, above a second dam, and just below a third one, on the Susquehanna, the extraordinary catch of 2,000 was made in 1872. In which year there was no abrasion of the Columbia Dam, and 2,000 represents a large multiple of the number caught near Sunbury at any period in the quarter of a century preceding 1867.

There are facts current amongst the people of the upper Susquehanna and the Juniata, and which are implicitly believed, so much so that whereas the restoration movement commenced in utter incredulity and ridicule, the Legislature now finds itself encouraged by its constituencies riparian to the great rivers in appropriating money for carrying out improvements which have already borne such good fruit. People of Sunbury have stated to the undersigned that previous to 1867 a shad of the upper Susquehanna would fetch in their markets always more than a dollar and sometimes as high as three, four and five dollars, whereas they look for them now every spring and scarcely have to pay more than a dollar a pair for them.

The people of Maryland riparian to the lower Susquehanna have observed a change for the better in their fisheries. They have done nothing to effect this, and the conclusion is inevitable to them that their neighbors up the river have been doing something, so that they are now exceedingly anxious to know what they shall do to aid and abet in the good work. There is scarcely any doubt that a commission will be appointed for that State at their present session of the Legislature. The abrasions in the Columbia Dam of 1873 were not easier of ascent for the shad than those of 1867. Yet the most extravagant claim for the catch of 1867 above the Columbia Dam was 20,000, the estimates varying between 12,000 and that number. If the fisheries of the river had not improved then since 1867 how could 50,000, (the number justly claimed,) be caught in 1873, whilst the utmost amount for 1867 did not exceed 20,000? In both years every available seine was employed.

It is entirely fair to infer that a large natural spawning took place year after year above the dam in years when there were abrasions of the dam as well as in years when there were not. The dam was originally so unfortunately located that abrasions have followed each other regularly on the recurrence of a severe winter as often before 1866 as since that time. But before 1867 there was no regular annual increase. There would be a good year and a bad year, due almost alone to the abrasions of the dam, the number ascending the navigation chutes being always very small, the great bulk of the runs of shad missing their mouths probably from their out-of-the-way locations.

There are navigation chutes in all the dams, yet shad only seem to ascend the first and second of them. The Shamokin Dam, just below Sunbury, has a large chute in it, yet shad, it may be said, are never caught above that structure. Yet, up to last year, it was only about a foot higher than the Columbia Dam, say seven feet five inches, the Clark's ferry dam, up the chute of which a few always have passed, being seven feet in height.

When ordered by the Senate of Pennsylvania in 1871 to make a Report on Fishways, the undersigned again called upon his friends, the Massachusetts Commissioners, and upon his experience gained up to that time, they agreed with him that the simple inclined trough was the best for low dams and shad. The gentler the inclination of course the better.

When the Pennsylvania Commission was appointed, with money in their hands to construct fishways, they adopted the idea of the inclined trough, employing the undersigned as engineer to construct it, and to make assurance doubly sure, reduced the inclination from 1:15 to about 1:35, whilst they added fifty per cent to the width of the opening in the dam. They however regard the success of the old chute with incredulity and hesitate even to pronounce before hand in favor of the new one until shad shall absolutely be taken in nets placed at its head.

Herewith is submitted a diagram of both the chutes, in plan and in profile, in order that a correct idea may be formed as to their form and their inclinations.

[It is impossible to give these diagrams in our paper as they would occupy a large space.—Ed.]

In December, 1873, the Pennsylvania Commissioners, Messrs. Reeder, Hewitt and Duffy visited both the chutes when the water as it entered them was about four feet in depth, the stage at which the shad are usually running in the spring. At this stage the chutes can only be approached in a steamer. The inclination of the new chute appeared so gentle that it was the unanimous opinion of all on board the vessel that if shad could not ascend that comparatively gentle current they would ascend no artificial in-

cline that can be made for them. I have not the slightest doubt that shad can and will ascend it. But the old chute was also visited, in which they did not express the same confidence. For, in the first place, the area of the early chute is not one-fourth that of the second, whilst the inclination of the first is as 1:15 is to 1:35. Certainly the latter structure is much the more easy of ascent. But the effect of the two chutes in the water below was very similar. A long stream beginning in white caps and undulating in diminished gradation, was observed below each of them in the line of the axis of the chute, produced and plainly perceptible for about 200 yards below the steeper chute and about 150 yards below the gentler one. It may be mentioned here as a memorandum that the river below the dam, even in high water, is not deep. At low water the dam stands on a bottom scarcely averaging a foot in depth. And the fishways both fall into water at that stage not more than three feet deep, and when the shad are running, the water below the dam scarcely averages four feet.

It is well known that shad are always attracted from their very earliest infancy by an opposing current; and that they are equally attracted by both these currents below the dam can scarcely admit of a doubt. So attracted, in the one case 200 yards below the dam and in the other 150 yards below it, they would undoubtedly stem both currents without preferring one to the other. For how could they know what there was to overcome at the head? Admitting the fact of the shad entering the currents at all the question left to be decided is: Can they overcome the velocity of the chutes? There is no hydraulic rule on the subject of water moving down inclined planes, which will give the water in either of these chutes a greater velocity than that of ten miles an hour.

Impeded by friction and by the water below the dam always endeavoring to enter the chute, for it must be remembered that if the water above were arrested, the water below the dam would back up the chute nearly, if not quite, to the head of the incline, thus impeding, then, the velocity must be considerably less than ten miles an hour. It cannot, indeed, by any possibility, be so great as ten miles an hour. For a body falling *in vacuo* at the third foot does not exceed that velocity, as the rule for falling bodies is $V = \sqrt{64.333 \cdot U}$ where s equals space in feet fallen and v the velocity in feet per second. Here the space in feet fallen is three and this subjected to the rules gives about fourteen feet per second for the velocity, which is less than ten miles per hour, as any school boy may easily ascertain with a slate and pencil. Now then can a shad stem a current of ten miles an hour? If he can, then either of these chutes he can ascend easily, if he will. It is easy to conceive that although the shad can ascend a chute, that he may not choose to do so. For he is an extremely timorous fish, and unless the chute be made attractive to him, he may avoid it or be scared away from it. But a chute from forty to sixty feet wide ought not to repel him, and one still wider of course would be less repulsive. It is fair to suppose that width would attract him, and that having in Pennsylvania adopted a capacious width, we are at least on the road to a successful fishway. As to the velocity a shad attains in swimming, it may and probably does reach fifty miles an hour. The velocity then of the Pennsylvania chute cannot be an obstacle to him. The reason why shad did not ascend the Pennsylvania chutes in large numbers is, that they were not there to ascend. Go back of 1867 and ascertain when there was any catch of 50,000 shad immediately below the Columbia Dam. Come this side of 1867, and in 1871 there was a catch of some 100,000 at least below the dam; and in 1873 we have a catch above the dam estimated, no doubt fairly, at 50,000, whilst there was an ordinary catch immediately below the dam. As stated then the reason why shad did not ascend the fishway in large numbers in the early years following 1867 was, that they were not there. They had to be made first, and where were they made? Above the Columbia Dam assuredly, whilst their mothers could not have got there in sufficient numbers had they not been aided by the early chute. There is not a navigation chute in the river that will not admit shad. But these chutes are not located in the right places, they are not in the runways. A few get up at Columbia, a few at Clark's ferry—these are the first two dams, but none get up at Shamokin, the third dam, the navigation chute of which is as easy as the other two and the dam not more than a foot higher. Now both the fishways in the Columbia Dam are well located. The earliest runs of shad take the right centre of the river; the latter runs take the left centre of it—(right and left in describing rivers are always referred to looking down stream.) So now we are ready for them at both sides, and proper structures thrown out from the navigation chutes guiding the shad to their mouths will bring very large runs to them. In Pennsylvania then, we are on the way to a good chute for a low dam, and if success be assured, it will be easy to accommodate things to a high one. The principle is wide capacity and low velocity. But velocity increases in a very strong ratio in falling water; it increases about as the square of the fall, and the difficulty of a fishway for a high dam is therefore nearly as the square of its height.

In making a chute then, for a high dam and for shad, you must divide it into a series of low dams, thus interrupting the uniformly accelerated velocity so that the proportion may be directly as the height, instead of as the square of the height nearly. There will be difficulty and expense then to be overcome in the case of high dams. Difficulties from freshets, difficulties from ice, but American engineers have not often been beaten, and it is fair to presume they will not be beaten in this instance. Fishways have been made which are a success for almost all other kinds of migratory fishes. Mr. Brackett's improvement on Foster's being perhaps the best of them. The timidity of the shad has baffled us a little at the outset, but we will yet accommodate him and fishways will be made as attractive to him as to the salmon, the alewife, the rock, and the eel. The history of this fishery movement will become interesting one of these days, and I read this paper in the interest of the truth of that history. Its initiation and its progressive steps ought to be known and understood. There may be mistakes and errors of judgment. Nay, there must be, because it is managed by human creatures. But let us have as few mistakes and errors as possible.

I close by saying that the Pennsylvania Fishway is believed to be the only one in the world that has as yet in appreciable numbers admitted shad; that the first one will not admit as many as the second only because it is much smaller and much steeper, they both being built on the same principle; that that principle is due to consultations held by the under signed, in the first place with Daniel Shure

and George M. Lanman, of Pennsylvania, the latter now no more, and with Theodore Lyman and Mr. Brackett, of Massachusetts, and latterly with H. J. Reeder, James Duffy and B. L. Hewitt, the present Fishery Commissioners of Pennsylvania, whose orders were obeyed in the construction of the latter work. There is no doubt of ultimate success, for we are moving in the right direction, even if we have not struck the actual pathway.

THE WORKING OF THE CANADIAN FISHERY LAWS.

QUEBEC, February 24, 1874.

EDITOR FOREST AND STREAM:—

In the Toronto *Globe* newspaper of the 4th of February, Mr. Venning replies to your inquiries respecting the administration of the fishery laws in his district. In this, the Quebec district, I will give you my experience and statements that can be corroborated.

In the District of Quebec, particularly above the city of Quebec, we have many fine rivers that formerly abounded in salmon. Most are now barren; a few—a very few—may have a stray fish. The Jacques Cartier alone retains its character for good fishing. This I attribute to the care and expense I have bestowed upon it for the past twenty years at my own expense, and with little, if any, aid from the Government. As one instance of the aid received from Government, some five or six years since I complained to the department of illegal netting going on on this river. Mr. Bunfret, Mr. Whitcher's assistant, was sent to investigate the complaint. He found matters as I stated. Mr. Hamel, the party complained of, made no secret of the matter. He showed Mr. Bunfret the place where he caught the salmon, a natural trap at the foot of a salmon pass, where it was his custom when the water was low to build a stone wall across the entrance to prevent the escape of the fish, then to take a scoop net and capture them. He showed Mr. Bunfret the net, and entertained him at dinner with some of the captured fish. This occurred in close time also, when the laws forbid netting on a river. The Government or the department would not prosecute. I did so, and obtained convictions against Mr. Hamel. I have no doubt this statement will be contradicted, but the records of the case before Judge Maguire are in the Court House of Quebec. In connection with a gentleman of this city, we rented the St. Ann's River above Quebec. There is a dam upon it; also, a large saw mill. There was an attempt at a salmon pass made on the dam, but it was so superficially built it was carried away the first winter. Sawdust in vast quantities are thrown into the river, and poaching goes on without interruption. I lodged a complaint and issued summonses for the sawdust nuisance; had all my witnesses ready on three rivers, when a member of the Government stepped in and proceedings were quashed. It was on the eve of a general election, and the offending party was powerful. This is one of the many instances of the protection given by Government to the salmon fisheries. The St. Ann's River is capable of being made as fine a one as many in the Dominion, but is now destroyed for the expediency of a vote.

I have prosecuted owners of bush weirs and stake nets on the Island of Orleans (immediately below Quebec), also some owners on the south shore of the St. Lawrence, for illegal fishing, first, the meshes of the nets not being according to law, and next in respect to bush weirs being used in capturing salmon. My cases were proven, but by legal ingenuity I was defeated. No correction of the abuses has been attempted since by the department and destruction goes on as usual. I instituted those proceedings, not from malice, but to protect my own rivers, whose fish I daily saw exposed in the market for sale. I could state many other cases to show the protection since.

I would not now refer to matters so long since passed, but I do so in the hopes that under our new Government those abuses will be remedied, and it will not require to resort to the expediency tactics to secure a vote, and the laws will be honestly administered. Under the late Government, if a complaint was made for infringement, the party complained of went to his member, who went to the Minister and said: "Such a one is my friend, and you must kill off the matter, otherwise do not count on my vote." Political influences have been the bane of the fishery laws.

Another instance of members' influence: A fishing inspector was sent to Grand Lake, near Murray Bay, and at the private expense of a gentleman, and on complaints of residents there of poaching, the inspector caught one man, seized his nets, &c., &c. This person, it was stated, killed 2,000 dozen trout in the year. He reported to the department, the delinquent was fined \$5. He was cousin to the inspector of the district and friend of the member.

Mr. Wilmot, on Lake Ontario, has established a provincial ovary, and has succeeded in his operations. The gentleman deserves great credit for his exertions. To come to the utility and cost to the country of Mr. Wilmot's exertions, so far as relates to salmon, I fear that it is a waste of time and money, from the following facts: From Levis to Rimouski, on both sides of the river and on the island of Orleans, bush weirs and stake nets may be counted by the hundred. To you and many of your readers it is unnecessary to give the habits of the salmon, but to some it may be well to state them. The smolt or young salmon remains in the rivers to which they are bred until they attain to four, five or six inches in length. In May, June and July they leave fresh water and go to sea, hugging the shores of the river in their descent; doing so they are caught or stopped in these bush weirs and miserably perish in the slime and mud. Before a Fishery Commission of Parliament, our honorable Senator gave it as his evidence that in one bush weir, and in one tide he saw from one to one half bushels of salmon fry or smolts thus perish. Any one taking the trouble can see thousands of small fish so destroyed by those murderous engines. I will ask how is it possible that Mr. Wilmot, or any of the American gentlemen can succeed in introducing salmon into any river that flows into the St. Lawrence?

Under our new Government I hope for a better state of affairs, and I have no doubt representations from the American Government would receive every attention. The demand should be, abolish bush weirs on the shores of the St. Lawrence.

SALMO SALAR.

MARYLAND FISH COMMISSION.—We announced recently that a Fishery Commission would no doubt be created for the State of Maryland. We are indebted to G. C. Carpenter, of the Baltimore *Gazette*, for a copy of the bill to establish such commission, and are assured of its immediate passage. This is a matter for general congratulation. We append the bill herewith. It will be remarked that appropriations are made for salaries, which we think is wise:—

WHEREAS, Both the marine and inland fisheries of this State have of late years much deteriorated, and a vast source of food for the people has been greatly diminished by causes within the reach of legislation, and—

WHEREAS, The experience of many of the States has shown that their fisheries can be fully restored by the proper propagation and culture of fish, and for that reason have appointed Commissions to take charge of the propagation of food fishes, and—

WHEREAS, The Congress of the United States has also appointed a Commissioner General of Fisheries, who is ready and willing to co-operate with the Commissioners of Fisheries of the several States in furnishing such aid and information as may assist in the stocking of the waters of the said States with food fishes; therefore—

SEC. 1. *Be it enacted by the General Assembly of Maryland*, That the Governor be and he is hereby authorized to appoint two competent persons, who shall continue in office

for two years from the time of their appointment, and until their successors are appointed, who shall be known as Commissioners of Fisheries of Maryland.

SEC. 2. *Be it enacted*, That it shall be the duty of said Commissioners to immediately proceed to inspect all the waters of this State, with a view of stocking the same with such food fishes as in their judgment shall be most advantageous, and with such object shall communicate with the Commissioner General of Fisheries of the United States, and with the Commissioners of Fisheries appointed by the different States, and report the result of their inspection to the Governor of this State as soon as practicable.

SEC. 3. *Be it enacted*, That it shall be the duty of the said Commissioners of Fisheries, after making the inspection and obtaining the information required in the preceding section, to proceed to the selection of proper locations for the propagation and culture of such food fishes as it shall be deemed desirable to introduce into the waters of this State, and obtain the necessary ova, and construct and erect suitable houses and devices for hatching the same, and protecting the small fish, until fit to be distributed, and then to distribute the same among such waters of this State as shall be deemed proper.

SEC. 4. *Be it enacted*, That it shall be the duty of the said Commissioners to make an annual report to the Governor for transmission to the General Assembly of the State, of the work accomplished by the Commission, and also embracing such suggestions for the protection and propagation of food fishes in the waters of this State as may be the result of their observation and experience; *provided*, that nothing in this Act shall interfere with any existing rights of catching fish in the waters of this State.

SEC. 5. *Be it enacted*, That the salaries of said Commissioners shall be fifteen hundred dollars per annum each, and that the sum of three thousand dollars per annum, be and the same is hereby appropriated to pay the said salaries.

SEC. 6. *Be it enacted*, That the further sum of thirty-five hundred dollars per annum, or so much thereof as may in the opinion of the Governor be necessary, be and the same is hereby appropriated for the purpose of carrying out the provisions of this Act; and the Comptroller shall issue his warrant on the Treasurer for the payment of the said sum on presentation of the accounts of the said Commissioners approved by the Governor out of any monies in the Treasury, not otherwise appropriated.

SEC. 7. *And be it enacted*, That this Act shall take effect from the date of its passage.

—*La Chasse Illustrée*, in its last number, has a most interesting article in regard to M. Pierre Charbonnier, who devotes his time to the rearing of fishes, and whose wonderful establishment for the sale of aquaria and rare fishes is one of the attractions of Paris. M. Charbonnier has several live specimens of the gourami and of the telescope fish, and many varieties of native and exotic fishes. M. Charbonnier has curious specimens of fish all the time on exhibition, which would make our good friends Green and Mather wild with delight. At present, however, in the United States, we must be satisfied with the useful and practical; after awhile will come the ornamental and decorative.

—In the last bulletin of the Paris Acclimation Society M. de la Blanchère gives considerable space to a description of the Nile fish—the binny. Some of our friends who have done the Nile have spoken to us enthusiastically in regard to not only the beauty but the excellence of this fish. It grows to almost three feet in length, and might be some of these days introduced into our southern rivers. The Fellahs, to express how good the binny is to eat, say:—"If thee canst find anything better than I am, well then don't eat me."

—The Forester Club, of Penn Yan, Yates county, New York, have just placed 100,000 young salmon trout into Keuka Lake. Over 250,000 of these fish have been put into these waters within the past three years, and the largely increased number of small fish caught in the lake last year shows that the efforts at restocking have not been without its useful results.

—We print herewith a copy of the Lobster Law, which has just been passed by the State of Maine:—

Be it enacted by the Senate and House of Representatives in Legislature assembled, as follows:—

SEC. 1.—No person shall catch, preserve, sell or expose for sale, within the limits of the State of Maine, any lobsters between the first days of August and the fifteenth day of October, of each year; and from the said fifteenth of October to the first day of April next following of each year, no lobster shall be so caught, preserved, sold or exposed for sale, under ten and one half inches in length, measuring from one extreme of the body to the other, exclusive of claws or feelers; but from the said first day of April to the said first day of August of each year there shall be no such restriction, nor any restriction, as to time or size, in the taking, preserving, selling, or exposing for sale such fish.

SEC. 2. Any person violating any provision of the above section shall be punished by a fine of ten dollars for every such lobster so caught, used, sold or exposed for sale, as aforesaid, one half to the person making the complaint and one half to the use of the town in which the offense is committed.

SEC. 3. All acts or parts of acts inconsistent with this act, and especially chapter twenty of the public laws of this State, approved February twentieth, in the year of our Lord eighteen hundred and seventy-two, are hereby repealed.

—We are requested by the Saratoga Rowing Association to print the following card:

SARATOGA ROWING ASSOCIATION.

It is necessary for the Saratoga Rowing Association to have the address of every amateur rowing club of good standing in the United States and Canada. The Association propose to issue soon its circulars concerning its annual regatta, which will be given some time in August. Therefore it is to be hoped that all rowing clubs will send their address, giving name of President and Secretary, so that none may be overlooked, nor fail to receive circulars. Address

SARATOGA ROWING ASSOCIATION,
Saratoga Springs, New York.

Woodland, Lawn and Garden.

THE GARDEN IN MARCH.

NEAR the latter part of the month of March, if the ground is in fit condition, which will be the case in some of the States, preparations may be made for considerable garden work. In order to be ready to take advantage of the earliest time for planting the seeds of either flowers, shrubs, or garden vegetables, you are to look well to the preparation of the soils. Do not put either plough or spade into wet ground. Do not work the soil when wet; as soon as it will crumble, or is in what is termed a "friable state," it may be worked to good advantage. Unless you desire to do your garden work over twice, and lose valuable seed in the bargain, be the seeds sown flower or kitchen garden seeds, do not plant them in the mud, or in a cold wet soil. As soon as your ground will crumble plough or fork it up with a deep trench, using for this purpose a trenching fork, and also work in plenty of well rotted compost and manures. Upon grounds thus prepared you may set currants, gooseberries, blackberries, and raspberries. Other rooted plants can with safety also be set out. Plant out your blackberries where they can remain undisturbed for years, as this plant, if properly cared for and properly cultivated, will need but little cultivation after it is once planted. Give your blackberry plants a good out of the way situation at one corner or end of your garden, and set them six feet apart each way. After they begin to grow cut the upright cones back to six inches of the ground, and muleh them well with sea weed or sedge, or what is called "tide wreck," known to every owner of marsh lands, and which is a very good article for mulehing. It keeps the ground moist, and is one of the requisites of the blackberry and the raspberry. After the first year's growth of raspberries the bearing shoots will generally be found somewhat tender, and care should be taken not to uncover them too soon. When you uncover and fork up the beds you can take the superabundant plants to make new beds with, and with good care you will obtain sometimes a quarter crop the same year you set these plants. Remember that good mellow ground, fairly fertilized, and well mulehed, is a *sine qua non* for a good crop. I have followed this rule for the cultivation of the blackberry and the raspberry for some ten years without the failure of a single crop, and can confidently recommend this method as one to be relied on. I do not use strong new manures as fertilizers, but prefer the well rotted peat compost and old stable manure well mixed and finely pulverized always for young and small plants.

As soon as you can, plough your asparagus beds, and do it in a thorough manner if you would insure a reward. Some prefer to fork deeply their beds, mixing well with good manure. You can do this if your bed is of a right shape, and it is a very good way. A good top dressing of salt will be found of much benefit to your future crop of asparagus; it being originally a plant taken from marine locations near the sea shore requires in a greater or less degree what is termed a "saline soil." As much profit is often derived from the skillful culture of this valuable esculent, a few words upon the subject may be of benefit to all who desire to make a bed of the same. To begin at the beginning, therefore, the time and manner of sowing your asparagus seed is of much consequence as governing your future crop. Procure the best seed to be obtained in the market, and early in the season (we prefer April), or as soon as the ground is in good working condition, sow in drills about one inch deep, scattering the seed very thinly, and covering it evenly with the soil. Sow the seed in drills say two feet apart, and when the plants appear, which they will soon do, thin them to about four inches apart; here they are to stand until the third season, when they are ready for sale or to set. If you are ready to plant your bed you should make your rows two feet or two feet six inches apart, and fill into the same any good strong manure, giving a liberal supply. Make your drills one and a half feet deep before placing in the manure, which level and cover slightly with garden soil. Light soil placed over the roots, or even clean sand, say an inch in depth, is a good addition, and will keep the roots in place until finally covered. Asparagus is impatient of water; therefore it should never be set too low. I prefer to slightly ridge the rows, raising the crown slightly and leaving in low ground a slight trench between the rows.

During the growing season keep the ground entirely free from weeds of all kinds, and be sure to keep the hoe going and your beds clean and neat. For the first two years after setting in the bed the plants should be well watered with manure water, especially if the season is very dry. In the autumn the tops should be cut and bound upon the ground, and in the spring the "haums" should be pulled from the crowns, as they will then part from them easily. The third season after planting the bed, the asparagus may be cut for market or use, but even at this time it were better not to cut too late. Manure liberally every autumn, and mix the same carefully into the soil over the crown, and you may trustingly await a fine crop of asparagus for a dozen years, provided you follow carefully the above directions.

OLLIPOD QUILL.

—The Machias (Maine) Union states Mr. J. A. Longfellow, of that town, last week, with his Ballard Rifle, fired ten shots at a two inch spot, distance 110 yards, with the following result: The poorest shot was put four inches from the spot, the last six shots cut into each other and cut an inch circle.

Natural History.

MUSEUM OF NATURAL HISTORY.—On Tuesday evening of last week a meeting of the Trustees of the Museum of Natural History was held, on which occasion the donation of Miss Wolfe, the daughter of the first President of the Association, Mr. John David Wolfe, was formally accepted. The gift may be considered as a Memorial, which must always connect the name of the late President with the Museum. The trustees have devoted no little attention to the interests of the Museum, and have aided with their money, having quite lately given from their private means \$9,000 for the purchase of certain collections. The Museum will shortly boast of having some of the finest specimens of the extinct *Dinornis* known. To the ornithologists, our Museum of Natural History, thanks to the energy and liberality of its trustees, will afford ample opportunity for study and research.

MARCH 11th, 1874.

MR. EDITOR:—Your article on the "Panther Feast" (Prof. Baird) reminds me of a similar one we once had in North William street on the flesh of the rhinoceros, the flesh of which we found to be very coarse grained, but not unpalatable. We had chops broiled and fried, and we enjoyed our feast very much.

J. H. BATTY.

STRANGE ANIMALS OF THE WEST.

RUSSELL, Kansas, February 18, 1874.

EDITOR FOREST AND STREAM:—

I wrote to you some time ago, asking the name of a rat I had found here. At the same time I wrote to a friend in Junction City about it. As he and you do not agree, and he also mentions several others, I will make some extracts from his letters, and you can publish them if you wish. Mr. Green, or "Seneca Bill," as he is known here, has been trapper and Indian trader on the plains and mountains for over thirty years, and is at present engaged in making a collection of wild animals. He says, "the rat you speak of I call the Carrier Rat (from his habit of carrying all sorts of old trash to his nest). The head of the Republican is as far north as I ever saw him, and never east of the Missouri. It is also found in Texas and New Mexico and in Mexico very plenty; but I have never seen it in Colorado. In the mountains there are four more kinds. One is somewhat larger than the Carrier Rat; black on the upper parts, underneath yellow; no ears visible, and a very short tail. Another is blue all over except nose, feet and tail, which are black. The tail of this kind is very long; its bite is poisonous. Another is white, and is as large as a muskrat. Then the great Kangaroo Rat also inhabits the mountains. * * * "I know of five different kinds of squirrels in the mountains and none of them as large as the Eastern chipmunk. The smallest is about as large as your thumb, very tame, and is the prettiest animal I ever saw. There is also a very large kind with wattles under the throat."

I had been told that the polecats of this country were poisonous, and asked him about it. He said, "I knew a man to be bitten on the thumb by one and he died on the third day after. This was on the Jacques River, in Dakota, about fifteen years ago. I have also heard of three persons poisoned to death in like manner in Kansas. Nothing but an all-fired big drunk saves a man, or something to counteract the poison immediately and thoroughly."

I can see no difference between the polecat here and those back East, but as I came here late last fall, I have seen but two or three. One thing quite noticeable to a new comer here is the absence of bird life in the winter. Snow Buntings, Lapland Longspurs, &c., make the bulk of what are seen. Now and then a hawk, or owl, or a shrike, and along the streams once in a while, a kingfisher, finish up the sum total. But soon the spring birds will be here. A few ducks have made their appearance. Antelope also have been seen lately. Buffalo are not expected until April. Grouse are very scarce; so our shooting is confined to Jack rabbits mostly during the winter.

F. S. B.

THE SUMMER MOULT OF WOODCOCK.

EDITOR FOREST AND STREAM:—

It is generally believed by sportsmen that our woodcock take to the corn-fields in the latter part of August, thus accounting for their sudden disappearance. Woodcock do frequent the corn-fields in the early part of August and even in July, if the maize has attained sufficient height to give them cover; but they are attracted thither by their usual food—the worm—during the wet seasons. By the latter end of August they have all gone to the mountains or high countries to pass undisturbed their moulting period, and until they have gained their full plumage, only to return to the lower grounds when forced by the freezings of autumn, which take place in the higher regions in October.

I was fishing with a brother sportsman in Luzerne County, Pa., some years since, if my memory serves me right, about the 20th of August (a little late for trout, by the bye), when we saw woodcock so numerous and presenting such a ludicrous appearance with their feathers half gone, like a part of a plucked pigeon, as to convince me such latitudes harbored the "long-bills" in this stage. I have since noticed in August quantities of woodcock on Wild Creek, Monroe County, Pa. These birds in October, before migrating, give good shooting, and their numbers are increased by the cock of the more northern States, driven by still earlier frosts, and stopping with them until the whole congregation are again forced to move farther south.

"Homo."

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS,
NEW YORK, March 14, 1874.

Animals received at Central Park Menagerie for the week ending March 13, 1874:

One red shouldered *Buteo lineatus*. Presented by Mr. J. J. King.
Two Irish Hares, *Lepus hibernicus*. Presented by Mr. Thomas Hamilton.
One Hybrid fowl; cross between a domestic cock and guinea hen. Presented by Gen. C. A. Johnson, Newburyport, Mass.
Received in exchange:
Four Ruddy Sheldrakes, *tadorna rutila*. Hab. Europe.
Two Jays, *Garrulus glandarius*. Hab. Europe.
One pileated Jay, *Cyanocorax pileatus*. Hab. La Plata.
Two California Quail, *Lophortyx Californicus*.
One Mona Monkey, *Cercopithecus mona*. Hab. West Africa.
Three Looty Mangabays, *Cercocetus fuliginosus*. Hab. West Africa.
Three Wood Ducks, *Aix sponsa*.
Two Golden Pheasants, *Thaumalea picta*. Hab. China.
Two Golden-crowned Conures, *Conurus pertinax*. Hab. Brazil.
Three Bobalinks, *Dolichonyx oryzivorus*.
Two Cow birds, *Molothrus pecoris*.

W. A. CONKLIN.

SHREWSBURY, March 11, 1874.

EDITOR FOREST AND STREAM:—

I am of the opinion that quail have the power of withholding their scent. Were it otherwise, the exertion in flight would increase their risk of being found by dogs, for the reason that motion tends to increase the

amount of scent given off. I am strengthened in my opinion by the facts that quail, during incubation, either have the power of withholding their scent or do not give off any. Several years ago I had my attention called to the fact, by one of my men asking me if one of my dogs had found a quail sitting near the road I had just come down, along a narrow strip of open woods, with my pair of dogs at my heels. Being surprised they had not noticed and pointed the bird, I inquired the situation of the bird and returned, and sure enough, there sat a female quail in plain sight, at about 15 feet distance from the road, and the wind blowing from her towards the dogs, both of which again passed without noticing the quail; this was repeated with other dogs with the same result. Both of the dogs were good on quail, and one the best on single birds I have ever seen.

CHECK CORN.

The Kennel.

THE "GILDERSLEEVE SETTERS"—THEIR PUBLIC PERFORMANCES.

WE are pleased to publish the first reliable account of the pedigree of the Gildersleeve Setters, formerly owned in Maryland. We are indebted to our friend C. S. Westcott, Esq., of Philadelphia, who is a thorough sportsman and a true breeder of high class setters, for the labor and trouble it has cost him in this matter; also to Redmond Abbott, Esq., of Philadelphia, who has kept faithfully during a long period of years the only record ever made of this stock. Mr. Redmond is a wealthy retired merchant, has been a gentleman sportsman for half a century, and distinctly recollects the "flint and pan" age, and has never owned any other stock than the Gildersleeve. Mr. Westcott says: "many of your contemporaries have written to me frequently asking for pedigrees, etc. of the best dogs in our city and vicinity, especially of the Gildersleeve breed, but as I had promised to give it to you, and have commenced to contribute to your journal, I shall continue to do so. It has taken me over three months of hard work to compile these facts in their proper form." The latter part of the account referring to the proposed breeding of "Buster" and "Tip" will be good news to the readers of FOREST AND STREAM who wish to secure two or three good dogs for the coming summer shooting. The names of the gentlemen sportsmen of Pennsylvania and Delaware who endorse this statement as to breed, record, reputation, and pedigree are the following:—Uncle John Krider, of Philadelphia; Mr. Graham, Captain Sipples, of Frederica, Ind.; Mr. David Brooks, of Philadelphia; Mr. James T. Massey, Mr. Redmond Abbott, Mr. C. S. Westcott, and many others.

PHILADELPHIA, March 16, 1874.

EDITOR FOREST AND STREAM:—

There is doubtless no breed of setters in America that have given such universal satisfaction as the "Gildersleeve." The stock is best known to Philadelphia, and has long been a favorite one. They are easily broken, have superior scenting powers, and great endurance and intelligence.

I am in receipt of a letter from Mr. Redmond Abbott, of Philadelphia, which contains an account of the stock more than thirty years ago, and from which I make extracts for the benefit of the readers of the FOREST AND STREAM. Mr. Abbott says: "I received yours of the 14th inst. through our mutual friend, Mr. John Krider, and presume I can give you the information you desire better than any one in our city or in this country."

"Many years ago, and long before a railroad was thought of through Delaware, I visited Canterbury with my old friend, Mr. Wm. Montelius, (now dead and gone,) on a shooting trip, and was taken into the field by Mr. Gildersleeve, who had at that time a white and orange bitch pup about six months old, which would then find and stand game. He called her 'Tip,' and she was a remarkable puppy in every respect. The following November we visited the place again and found 'the wonder' had grown to be a fine, large, speedy bitch, and would take us to every bevy of quail in the neighborhood, and showed unsurpassable nose and staunchness.

"She was bred first to a celebrated lemon and white setter known as the 'Carter dog.' Two pups of the litter I procured, and one was given by Mr. Gildersleeve to Mr. Peter Bonwell, with the express understanding she should be 'altered,' but the promise was broken, for which Mr. Gildersleeve never again spoke to Mr. Bonwell. This bitch was coupled with Captain Sipples' dog of Frederica, at that time the best in Maryland. The result of this union was 'Don,' by accident he bred to his dam, and G. A. Benson's 'Bruce' was pupped, who was the sire of Mr. Geo. Twaddell's 'Buster,' Mr. John Twaddell's 'Hark' and Mr. Peter Rose's 'Nellie,' out of Dr. Henry Twaddell's celebrated 'Bess.'

"Another puppy by Capt. Sipple's dog was bought by Mr. James T. Massey, a bitch, which he called 'Tip,' and which he put to Mr. Gatsmer's 'Jim.' I also procured from this union a bitch, and presented her to Mr. Elmer, of Bridgeport, New Jersey, which he named 'Nannie,' and bred to Mr. David Brooks' 'Biz,' two pups of which I had given me, now capital field dogs, 'Rock' and 'Tip.'

"Mr. Gildersleeve's old 'Tip' was twice bred to the 'Carter dog,' and several times to Mr. Montelius' 'Dash,' was by 'Bruce,' out of Mr. Craig's bitch. 'Bruce' was owned by Mr. Virden, and purchased by Mr. Montelius when six years old for fifty dollars. He lived to be eighteen years old, and was very steady at his point and fast on his range. The Gildersleeve bitch 'Tip' was very large, with a remarkably long muzzle, and all her offspring invariably turned out well, and were noted for their nose; their range was fast and wide, and I do not hesitate to say they were the most valuable dogs in the country. Mr. Gildersleeve was very particular to whom his setters went and generally destroyed most of them when pups. I have seen a son of the old, bitch called 'Rock,' belonging to Mr. Graham, fall and roll over when he came on a covey, so great his speed and so sudden the cheek he gave himself.

Old 'Tip' and Massey's 'Tip' both lived to be in their teens, and 'Fashion' and three other bitches were all that were ever raised from the Gildersleeve; one named 'Kate,' belonged to Mr. Graham, a sister to his 'Dan,' and the pair were difficult to beat.

I owned two of 'Kate's' pups, 'Dash' and 'Bruce,' which

were stamped with the same characteristics of the 'Gildersleeve.' I have seen one of this stock, 'Rolla,' stand a quail with another one in his mouth.

The first litter of pups from old 'Tip' by the 'Carter' dog were 'Rolla' and 'Don,' the Bonwell bitch, and 'Fashion,' the one I got for Mr. Maslin, and who let Mr. Fitzgerald of Camden, have her. These made the start of the three branches. Mr. Bonwell bred the Benson 'Bruce,' Massey's 'Tip,' and a dog H. Smith, Esq., sold in the south for an enormous sum.

"Gildersleeve then raised from old 'Tip' G. Graham's 'Rock,' W. Graham's 'Kate,' and his own dog 'Dan.' W. Graham bred from 'Kate' my dog 'Dash,' and 'Bruce,' and a setter Mr. Gildersleeve shot over for some time. Mr. Fitzgerald raised several litters from his 'Fashion,' and the only Gildersleeves now living that can be traced are those raised from 'Nannie' of Mr. Elmer, and those of Twaddell. My setters 'Rock' and 'Tip,' of the Elmer bitch by Mr. Brooks' 'Biz,' have all the excellence of the Gildersleeve and the fine qualities of the sire, and there is a probability of 'Tip' being bred to Mr. Twaddell's 'Buster,' the coming summer. As Mr. Graham, who keeps my dogs, is a man of little means, I have given him the privilege of breeding her, providing three or four pups can be sold at a price to make it an object. A letter to Mr. Graham in care of R. Abbott, at Mr. John Krider's, corner Second and Walnut streets, Philadelphia, from Sportsmen wishing one of this stock, (providing the union is made,) will receive a reply with particulars. Truly,

R. A.

This will make A No. 1 setters, and it is hoped they will be bred together, for both sire and dam are Gildersleeve, and Biz, (the setter you gave such an excellent account of in your journal a month ago,) the sire of the will-be-mother. I add a concise and plain pedigree of both "Tip" and "Buster."

"Tip," out of Elmer's Nannie, by Brook's Biz; Nannie out of 'Massey's Tip, by Gatzmer's Jim; Massey's Tip out of the Bonwell bitch, by Capt. Sipple's dog; the Bonwell bitch out of the old Gildersleeve Tip by the Carter dog.

"Buster" out of Dr. Twaddell's Bess, by Mr. G. A. Benson's Gildersleeve Bruce; Bess out of Twaddell's Cora, by his Rake; Rake by Don of the Gildersleeve stock; Don out of old Tip by the Carter dog.

Buster's color is orange and white ticked, or one might say orange roan, with ears and forehead deep orange, a spot of the same color on his left side, and on his back and rump; his ear is rather small, eye large and deep hazel, with black nose and lips, and very heavily feathered. He has great depth of shoulder, large brisket. He is iron, and eight years old, and can stand just as much hunting as he could five years ago.

HOMO.

—We had the rare pleasure of seeing three fine dogs at the Washington Hotel this week, imported especially for that genial sportsman A. E. Chamberlin, of Towanda, Pa.; a full blooded St. Bernard pup, promising great sagacity, and to become in time a lion in size as well as color; a black and tan fox hound, and an orange and white setter that bids fair to give a good account of himself in the field, if properly handled.

THE LAVERACK SETTERS.

We are in receipt of the following from Mr. Laverack, whose breed of setters is so widely known. This communication is of great interest to all field sportsmen, as it sets at rest all those much disputed points in regard to whether the numerous so-called Laverack setters are of undoubted origin. From the many dogs we hear of, all called Laveracks, one would suppose that they abounded in the United States. Mr. Laverack thinks, and we fancy no one will doubt his authority, that the good name of his dogs has often been taken in vain.

BROUGHAM COTTAGE, SHROPSHIRE, Eng. {
March 6, 1874. }

EDITOR FOREST AND STREAM:—

I have never yet sent or sold a dog or bitch to America.

There may be people that have sent dogs said to be purely my breed, which I should say were not pure; they may have on one side a pure sire, but not pure on each side, sire and dam, consequently are crosses, the quality of which as well as goodness and work I will not guarantee or be answerable for. In this country, I regret to say, many advertise dogs for sale as pure, and state them to be Laveracks which are not pure.

I never sell any made or aged dogs; but I do sell puppies at seven weeks old, which I guarantee pure, bred by myself. I have no hesitation in saying it would be a proper investment for any of your sporting friends to purchase a pair of dogs—that is, male and female, direct from me and guaranteed pure and bred by me. At present I have one litter, but all are disposed of. Mr. Price has bespoken a pair and the others are sold, reserving one pair for myself. As I am close on seventy-five years of age, I think of selling one or two pair of my dogs. One is a lemon and white, two years old. I ran her all last season in Scotland. I never had a better; but she is too fast and too good to remain with an old man solely for breed. I have also one dog five years old, a clipper; he ran four seasons, I would also sell, as I have plenty without, not so keen bred. I have used him as a stud dog.

You may quote with safety any portion of my work on the "Setters." I guarantee every word true. I am, yours truly,

E. LAVERACK.

[The remaining portion of this interesting letter from Mr. Laverack contains an account of pedigrees and performances of his breed of dogs at English field trials, which would not be interesting to the American public. The price of the Laverack puppies and dogs can be ascertained either verbally or by mail.—Ed.]

MARKING SETTERS.

WASHINGTON, D. C., March 16, 1874.

EDITOR FOREST AND STREAM:—

I have read with much interest the letter of "Mark," from New Haven, Conn., on the subject of training puppies, especially that part which treats of the *marking process*. I have a very fine setter slut, which gave birth to a litter of pups on the 12th of last August, and they have proved to be the smartest she ever had. During the latter part of July I hunted her on woodcock, and in my wanderings through the swamps came across a bevy of young quail, and she stood there every time we passed over the same ground. After the pups were of suitable age they were taken from the mother and a pair sent into the country; and I have seen them in the latter part of December—a little over four months old—go over the ground and point their game as well as any old dogs I ever saw, and the gentleman to whom they were given says: "They hunted in that manner from the first time they were taken to the field." I can only think as "Mark" does, that hunting was born in them. I intend in future to follow his instructions.

JUNIOR.

LYNCHBURG, Va., March 10, 1874.

EDITOR FOREST AND STREAM:—

The copyist wrote in my article on Fox Hounds that they run twenty miles an hour. It should be twelve (12) miles an hour. Please correct.

Yours,

JACOB WAGNER.

The Horse and the Course.

—The owner of Fullerton has offered to match him against any horse in the world for \$10,000, the trot to be on the Fleetwood track, mile heats, best three in five, in harness. The offer is to be good for any other track, providing Goldsmith Maid is barred out of the contest.

—Mr. Roden has offered to match Castle Boy against American Girl for \$10,000, in two races, one of mile heats, best three in five, in harness, and the other of two mile heats, in harness.

—The Augusta Jockey Club of Georgia held the second day of the spring meeting on March 13th. The weather was clear and bracing and the attendance very good. The first race was a dash of one and a half miles, for a purse of \$250. There were three entries—Hitchcock's bay mare Tabitha, Bacon's bay horse Granger and Weldon's bay gelding Midnight. Granger won the race in 2:52½, Tabitha second. The second contest was a mile dash for three-year-olds; purse of \$300. There were entered Major Bacon's chestnut filly Flower Girl, and Hitchcock's brown filly Lutetia H. The former won easily. Time, 1:51½. March 14th was the last day of this meeting. There were two events on the card, the first being a handicap hurdle race, over six hurdles, one and a half miles, for a purse of \$200. There were but two entries—Dr. Weldon's brown gelding Midnight and Major Bacon's bay gelding Jim Hinton. The latter won easily in 3:03½. The second race was a dash of two miles, purse of \$300. For this there were entered L. A. Hitchcock's chestnut colt Limestone and Major Bacon's bay horse Granger. It was hotly contested throughout, but Granger proved too much for his competitor, and went under the wire a winner by one length and a half. Time, 3:44½. The Jockey Club presented Messrs. Bacon and Jones with a silver cup, in appreciation of their efforts to revive the amusements of the turf in Augusta.

—We are much obliged to Mr. Whipple for a ride behind his splendid team on Tuesday. The horses are well matched, richly upholstered, and stand about ten feet from the wagon. They got over the ground at a spanking speed, and threw gravel, cobble stones, mud and so forth at every leap. We think there was more of the so-forth than of anything else. On the return we were helped out of the wagon by sympathizing friends and a derrick. There was about half a coffin-full of debris in our hair, bosom and eyes, while our face looked as if we had participated in a private powder explosion. We enjoyed the ride very much, and sincerely hope Mr. Whipple will die a natural death, but have our doubts.—*Danbury News*.

DAILY FEED OF A HORSE.—A "Young Farmer" gives us his manner of feeding a horse that is doing no other work than the general driving. In the morning his first feed is one quart oats, after which he has six pounds cut hay; at noon he is first watered and then fed eight pounds cut hay; at night he is watered, given one quart of oats and six pounds of cut hay. This makes a daily allowance of twenty pounds of hay and two quarts of oats, which with hay at \$20, and oats at 70c, will cost 24½c. He has salt in his crib, and is given a dose of salt and ashes once a week; once a week also he has a quart of finely cut carrots. If the horse works the quality of oats is doubled. Our correspondent says, "show us your better or cheaper methods of feeding."—*Maine Farmer*.

LETTERS FROM NEWFOUNDLAND.

HARBOR GRACE, N. F., L. D. {
February 23, 1874. }

EDITOR FOREST AND STREAM:—

I had the pleasure to receive a copy of your paper, the FOREST AND STREAM, and beg leave to thank you for your attentions. Our winter down here is passing over; rather of a mild character, if we except the first week of February, which gave a mean temperature of 12.9. The ice formed twice upon our harbor, but was carried out to sea after a few days' stay. Our sealing fleet is preparing for the spring campaign. This season they will take their departure somewhat later than in former years. Sailing vessels will leave the 5th of March and the steam fleet the 10th. Formerly the 25th of February and the 1st of March were the dates, but we found it necessary to pass a law restricting their sailing to the above dates, owing to the destruction of the young seals before they had come to what we call a merchantable size. Our cod and herring fisheries of last season were, upon the whole, good; the former yielded 1,000,000 of quintals, and the latter 100,000 of barrels. Should anything noteworthy transpire during the spring, I shall send the FOREST AND STREAM a note of the same. I enclose the first instalment of a series of papers, entitled "A Journey Across Newfoundland." I think the publication of these sketches would interest your readers. I shall forward them as they appear if you should desire it. A number of sketches of our island during 1872 and 1873, by a young friend and countryman of my own, are about to appear in an Edinburgh newspaper, which would also afford me much pleasure to forward to the FOREST AND STREAM. It will hardly be credited that this island, so close to Great Britain, should remain so long without being surveyed, as little is known of the interior now as in the days of Cormack, some fifty years ago, if we except the partial journeys of Cathrae, in 1872 and 1873. The interior, with its fine hunting grounds, are unknown to all except the Micmac Indians; the Berthie or Red Indians are extinct; some thirty years ago the last of them were seen.

I enclose a small pencil tracing of the island, with Cormack's track from Trinity Bay to St. George's Bay, to illustrate the journey across the country. Yours sincerely,

A. M.

St. Johns, Newfoundland, February 23, 1874.

EDITOR FOREST AND STREAM:—

I am glad to find that my article on the "Octopus" met your approval. Many thanks for the Nos. of FOREST AND STREAM you were kind enough to send. I shall be glad to recommend such an admirable and interesting periodical among my friends.

The engraving is excellent; most creditable to the artist. I have divided the head, arms and parts of the body of Decapod between the Smithsonian and Cambridge, (Mass.) Museums. Agassiz, Verrill, Baird, were all anxious to have it, and wrote me on the subject. In the *Field* (London) an engraving similar to yours, accompanied with a description, appeared, for which the proprietor sent me five guineas.

I shall endeavor to send you occasional articles of interest. Very truly yours,

JNO. HARVEY.

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, trails, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.]

A. D., Sing Sing, N. Y.—Tapers went out of use fully fifteen years ago. The rifle uses firing-pin and central fire cartridge.

G. M. A., Plainfield, N. J.—Where in New York can I procure lance wood for fishing rods, and about what does it cost? Ans. Write to Bonhoeft & Son, 90 Walker street, for large lots, or to J. H. Terhune, corner Elm and Canal.

F. C. M., Pittsburgh.—Please inform me where good trout fishing can be had in Pennsylvania and the expense per day? Ans. Pine Creek, Lycoming County, and the streams a little to the northwest of Lock Haven, is a good place to start from.

PHILADELPHIA Asks several questions about gamekeepers, but omits to attach his signature to the letter. You will please notice the italics at the head of Answers to Correspondents. The attention of several others needs to be called to this point.

J. L. II.—I have heard that some men have been engaged in raising mink in parts of the United States and Canada. Can you inform me if it was a success? Ans. Quite so in all cases that we know of where the parties have devoted their energies to it. The Verona Minkery, in this State, is a decided success, and so was the minkery near Kentville, Nova Scotia.

J. S. B.—What is the best kind of reel to use in surf fishing for blue-fish and striped bass? Ans. A large, heavy, easy working click reel that will hold at least 100 yards of line. 2d. What do they cost, and who are the best makers? Ans. There are several good makers, and prices range from \$2 to \$20. You can get a good brass reel for \$5.00. 3d. What is the best kind of line? We prefer the waterproof linen laid line, though braided silk lines are good.

G. B. M., Detroit.—What are the sizes of targets used at Creedmoor? Ans. Third class, used up to 300 yards, target 6 feet by 2; bull's eye, 8 inches square, centre, 2 feet. Second class; 300 to 600 yards; target 6 feet square; bull's eye 2 feet square; centre, 4 feet. First class, over 600 yards; target 6 feet high by 12 wide; bull's eye, 4 feet square; centre 6 feet.

BEAVER., Bald Mountain.—Does the firm of Smith & Wesson manufacture a breech-loading gun? if so, whom should I address for price list? Ans. Yes. F. Wesson, Worcester, Mass. 2d. Does the size of grain of powder manufactured by Hazard increase or decrease with the No.—i. e. is No. 4 larger grain than No. 7? Ans. No. 4 is finer than No. 7. 3d. Would a letter addressed "Tatham Bros., Shot Manufacturers, New York City," reach that firm? Ans. Yes.

DAUPHIN, Harrisburg, Pa.—Can you give me a description of the fly used in catching shad. Has it been used with any certainty of success? Ans. A cast like the following has been used with success: First bobber a very small fly pure lemon color, body, wings and tail; second bobber green drake, same size; tail fly, dark blue body with dun wings, same size. These will do for the Connecticut River. For the Savannah at the head of the Falls above Augusta, use small brown or dun flies. Yellowish combinations are all good.

SIM.—Can you inform me, either by letter or in your interesting paper, where the best place in Pennsylvania is for general shooting and fishing, and about what the cost would be per day there? Ans. The best place is along the Sinamahoning River and tributaries, through McKean, Cameron, Wyoming and Potter Counties. You will have to camp out; cost per day for guide, \$1.50 and found. Kettle Creek, Powder River and Youngwoman's Creek are splendid trout streams.

F. W., Boston.—What kind of wood do you think would be the best to make a light rod of to fish with bait? Ans. Ash rod with lancewood tip. 2d. What is the price of Fowler's rubber reel? Ans. 100 yards, \$4.50; 40 yards, \$3.50. Lancewood is not used for whole rods, only for tips, and sometimes for middle joints; too heavy. Is there any book which gives instructions in rod making and fly tying? Ans. Scott, Norris and Frank Forrester.

SUBSCRIBER, New Haven.—In your table of Close Seasons, published in the last number of your paper, I see you give close seasons for grayling in Pennsylvania. Are there any grayling in Pennsylvania, or indeed anywhere in this country, and if so where, and is there any way of procuring the spawn? Ans. There are no grayling in Pennsylvania or elsewhere in the United States, so far as has been discovered, except in Michigan. As to spawn, we are advised that certain parties are making arrangements to furnish it in its season. The line you refer to in the table was accidentally misplaced.

WANDERER.—What sport in the way of shooting and fishing is there near to San Francisco? Do the California quail offer much sport? Is there any pinnated grouse shooting there? Ans. There are an abundance of quail, black tail deer, English or Jack snipe, rabbits (cotton tail) and hare all about San Francisco. The game fish are not so abundant. The trout found in the mountain streams are of the species of salmon trout, and do not afford the sport one would expect who has been among the brook trout of New York and Pennsylvania. The California quail do offer great sport, being not only "game," but are abundant. The grouse are not to be found near San Francisco. In Oregon they are abundant.

EXCHANGE, Newark, N. J.—Please give me your advice on the following and oblige: 1st. I have been offered a fine muzzle loader of Hollis & Sons' make, in exchange for my genuine Lefauchaux pin-fire breech-loader. Would you advise me to exchange? Ans. Certainly not. 2d. Is a pin-fire gun as serviceable as a muzzle loader, and will it shoot as well? The pin-fire is the most useful in every way; as to the shooting qualities, that depends on the chamber, breech and barrels. 3d. What is your opinion on the Lefauchaux gun; how does it compare with the English central fire? Ans. There are no Lefauchaux guns made now. Most all breech-loaders are made on the system invented by Lefauchaux. 4th. My canary is shedding its feathers and has not sung for two weeks; what will relieve him? Ans. Nature.

D. H., New York.—Would you oblige me by answering, through your interesting paper, the following questions: 1st. For a young sportsman who goes out gunning, say a dozen times a season, what kind of a hunting dog would be best for his use, a field spaniel, setter or rabbit hound? Ans. By all means a setter. 2d. If a setter or hunting dog of any kind is kept in a house in the city during the summer, would he get spoiled for hunting (of course I mean after he has been broken)? Ans. It would not injure a dog materially to keep him in the yard, but allow no one to be familiar with him but yourself; never encourage him to put his paws on you and act like a pet; keep him in his place, never forgetting that you are his master, and when you instruct or tell the dog to do anything see that he does it and no fooling. 3d. Could you recommend me to any one that is a good dog trainer? Ans. Arnoldy, Newtown, Long Island.

—Prof. V. N. Edwards, of Sandwich, Mass., sent to the Smithsonian Institution and National Museum, Washington, last week, the following fish:—The Boston ling or cusk, the red fish, the winter flounder (such as are caught on Crab Ledge), and a fish called the sole in New York, and in New Jersey called the hog choker. This fish was caught at Davis' Neck; also sent two chicken halibut and some slime eels, and some young sculpins that he hatched out in a jar of salt water.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

103 FULTON STREET, NEW YORK,
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty percent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, MARCH 19, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

REMOVAL.

The office of FOREST AND STREAM will be removed early in April to the Iron Building, No. 17 Chatham Street, lately occupied by the *Staats Zeitung* newspaper, which we have leased for a period of years. This splendid location in Printing House Square we shall occupy jointly with our popular daily contemporary, the *Evening Mail*.

ADIRONDACK PARK AND THE PRESERVATION OF OUR FORESTS.

AT almost the commencement of the publication of the FOREST AND STREAM, we gave, in a comprehensive article, notice of all the localities which the Commissioners of the State Parks thought should be embraced in the Adirondack Park.

It is wonderful how in the short space of less than five months public opinion has changed, and how it to-day fully appreciates and endorses the views expressed by us in October last. Our attention has again been called to this plan of a State Park by the first annual report of the Commissioners of State Parks, together with Mr. Verplanck Colvin's very thorough topographical survey of the Adirondack wilderness. With renewed interest directed towards this important subject, the Assembly of the State last January ordered additional copies of the original report to be printed, and for full information in regard to these reports we refer our readers to No. 9, Vol. I., of FOREST AND STREAM.

If at first these measures, viz.: the preservation of a certain extended area of lands, which should ever remain the property of the State, were somewhat foreign to our American ideas, the reason for it, its necessity, are to-day better understood. Our people are getting more thoroughly educated, and now commence to appreciate that it is not alone for to-day they should think, but for the future. Not only in State Assemblies, but in the Senate of the United States, the preservation of certain extended tracts of country has taken fast hold of our legislative minds, and their attention is even being called to timber culture and the best methods for preventing the waste of our forests. This little return to common sense begins to make itself seen in various ways.

Last week Mr. Alvord introduced into the New York Assembly further measures for the formation of the Adirondack Park. Mr. Alvord's bill is as follows:—It dedi-

cates all the lands owned by the State lying within the limits of the counties of Essex, Franklin, Hamilton, Herkimer, Lewis, St. Lawrence, and Warren to the purposes of a public forest park, to be known as the "Adirondack Park," and names as commissioners to purchase such lands as may be needed, and accept donations of other lands, the State Engineer and Surveyor ex-officio, Horatio Seymour, Patrick H. Agan, William B. Taylor, George H. Raynor, William A. Wheeler, Verplanck Colvin, George Dawson, and Robert B. Roosevelt. The commissioners are required to serve without pay, and vacancies in their number are to be filled by the Governor and Senate. The bill also provides for the appointment of five forest park keepers, whose compensation shall not exceed \$500 each per annum. This is a good commencement. Some day we will have a school of foresters in this very region.

In Washington last week Mr. Sprague, of Rhode Island, in the Senate, called upon the House to amend the act to encourage the growth of timber on the western prairies, which was passed, and later the House concurred in the Senate amendments to the bill providing for the encouragement of the growth of timber on the western prairies, and passed the bill.

It happens that just at the present moment several of the largest western lumber dealers are in Washington, and they state that the most productive of the western lumber districts are being rapidly denuded of pine timber. These gentlemen are supporting the recommendation of the President for the appointment of a commission to inquire into the causes and means for the prevention of the destruction of pine timber.

All this is most encouraging. Some months ago we gave the names of several gentlemen, distinguished for their thorough acquaintance with arboriculture, who, keenly awake to the many great interests of the country which were suffering from the dreadful waste of our own resources, had gone to Washington, and we are pleased to notice that the measures proposed by them have claimed the attention of the President. "Great oaks from little acorns grow." This being a true motto for those interested in these subjects, let us hope that these first efforts to direct the public mind to our forests and their preservation will in time bear fruit.

REPORT OF THE COMMISSIONERS OF FISHERIES OF THE STATE OF NEW YORK FOR 1873.

IT was natural to suppose that the work of pisciculture in this State would be well done, and the report of the Commissioners of Fisheries of the State of New York for the year ending December 31st, 1873, explaining the character of their labors, is fully equal to what was expected of them. From the geographical position of the State, with its noble rivers, its broad expanse of lakes, and from its being the most prominent as to wealth and population, New York might be considered as exactly the State where, as far as fish culture went, the crucial experiment would be tried.

Our most worthy commissioners, Messrs. Horatio Seymour, Edward Smith, and Robert B. Roosevelt, with Seth Green the superintendent, all gentlemen well known for their intimate acquaintance with the interests confided to their care, have evidently made the subject of the State fisheries a labor of love. Not alone is New York indebted to these gentlemen for the wealth of fish she must gain, but the whole of the United States is incited thereby to follow her example, and to give due attention to what are questions of vital importance.

What is wanted in all such reports is that they should be perfectly practical, and the one under review is eminently so. Subjects of this character it is essential should be so written as to be readily understood. Many of our people regard State pisciculture in the light of an ornamental science, which has no further aim or end than to produce some few rare or expensive fish. Too many practical men seem to look on aquaculture with the same indifference as they would the subject of fancy horticulture. They may admire the rare hot house exotics, but have a decided preference (and we do not gainsay their likings) for cabbages and turnips. Pisciculture to them means "educated trout," worth a dollar a pound, and they will not comprehend, or are not yet informed, that State pisciculture has for its end and aim the production of shad, good big ones, at twenty-five cents apiece, such as no poor man buy because they now cost seventy-five cents or a dollar, and to make salmon cheaper even than pork. This is exactly what State pisciculture is striving to accomplish, and what the fish commissioners are endeavoring to encompass.

The sixth annual report for the State of New York states that last year 5,410,000 shad were successfully hatched and turned loose, the majority in the Hudson and a smaller number distributed in other localities, where it seemed to be advisable to attempt to colonize them. The operations on the Hudson were commenced on the 20th of May of last year, and ended on the 30th of June. Warm weather setting in just then, the water being at more than eighty-two degrees, the fishery was stopped. The total number of shad caught was 1,643. Of these 293 were ripe fish, and from them almost five and three quarters of a million of spawn were taken, and some 5,041,000 young fish hatched out. It may be seen that the loss then was most insignificant, about twelve per cent.

The work of last year was supplementary, then, to the labors of 1872, when upwards of seven and a half millions of young shad were put into the Hudson. This quantity

of young fish must in time (providing any sensible laws are made in regard to shad fishing) render the Hudson fruitful in fish, because the ordinary catch of shad in the Hudson, from its mouth to the dam at Troy, does not exceed to-day a million of fish. One might even at first suppose that the number of young shad in the Hudson would be almost in excess of its capacity, but the poor shad have a hard time of it. On the Hudson, from its mouth to Troy, there are barriers of nets after nets; for 160 miles the river, in shad season, is one huge fabric of meshes. Gill nets and seines encompass the fish. For some distance above New York floating or stationary gill nets are all the time in use during the season. The quantity of engines of destruction employed have had the effect of militating even against the interest of the fishermen.

"Three years ago"—we quote the report—"the shad fisheries of the Hudson were so run down that very few of them were paying, and many fishermen had discontinued their labors." For the last two years, however, the fishery has improved, "and," add our commissioners, "with the assistance of a proper law, establishing a weekly close time, there is no doubt that the fisheries can be restored to their original condition."

What is it, then, the commissioners ask? The least bit of jurisdiction possible. They pray that the shad shall have only the shadow of a chance, and they beg that in shad fishing time an act shall be passed *forbidding the use of nets from Saturday night until Monday morning of every week*. That is all, only time enough to allow some few harassed fish to escape the labyrinth of nets, so that they can run up stream to their spawning grounds and reproduce their kind. If the State, then, gives a certain amount of money, no matter how large or small it may be, for the specified purpose of producing fish, it seems rational to suppose that it should pass certain measures for their proper protection.

Our fish commissioners have also been able to find out this year whether shad, a migratory fish, living alike in fresh and salt water, could exist entirely in inland waters. In 1872 experiments were made with young shad introduced into the Genesee and rivers flowing into fresh water lakes, and in 1873 shad were caught in lake Ontario fully seven inches long. Last year, we are pleased to state, a more thorough essay was inaugurated, and 54,000 young shad were deposited in Canandaigua and the same number in Cayuga Lake, and the commissioners, in order to test this most interesting subject, have distributed the shad widely in various sections of the country. During the spring of last year, under direction of Professor Baird, Mr. L. Stone took 85,000 young shad to California. So it may be seen how the principle of exchange comes in; we take the California salmon for our own rivers and send them in return our shad.

The honorable Robert B. Roosevelt, in his opening address to the American Association of Fish Culturists, gave a thorough *resumé* of the prior work of the commissioners, and stated that at the incipency of their labors the dearth of shad was so great that the commissioners were never able to obtain as many matured fish in the spawning beds as they desired, and hence had effected much less good than they would have done if a sufficient number of eggs could have been procured. However, thanks to the commissioners, matters have much improved since that period in regard to shad.

A most interesting portion of the report is that devoted to the description of the State hatching house at Caledonia, which serves mainly for the maturing of the ova of the white fish and salmon trout eggs, and full details of a perfectly practical character can be found in the pamphlet in regard to the transportation of the eggs or of the young fish, and advice to those desirous of stocking their ponds. In the appendix we notice a regular account has been kept of all shipments of eggs of the white fish and salmon trout sent to various parts of the world, some going to England, and also of the young fish—black bass, Oswego bass, and rock bass—delivered.

We have declared the report to be distinguishable by its practical character, and this is evident from the fact that it is shad culture on the Hudson and other rivers which is the all important subject. Before we may expect to have the venison and the ortolans let us be satisfied with plain beef. The people and the legislature want to see shad in quantity, and cheap at that, and then they will be glad after awhile to give their money for the production of rarer fish. The memory of a well beloved king of France went down to posterity because he said he wanted "every man in France to have a chicken in his pot," and the commissioners, by working might and main to produce for us shad in quantity, will, we believe, at no very distant period, by their success, be considered as benefactors by those who suffer in this city and in the State from the want of a cheap and wholesome fish diet.

One most difficult time for all our fish commissioners has, we believe, almost passed away. It is what we might designate as the "period of popular expectation." The good people of this country having in the most inconsiderate way, for the last fifty years, consumed and destroyed fish, expect the fish commissioners in a magical way to bring back all the fish in a fortnight, forgetting that to restore our rivers must occupy years. We believe that popular impatience has but a very short time to wait. What has been done with salmon in England, and with shad in the Connecticut, will be repeated in the Hudson.

Mr. Roosevelt's paper, before alluded to in this article, has so many interesting points in it as supplementary to this general report, that it will shortly be produced by us.

THE STOCKING OF OUR EASTERN BARRENS WITH PINNATED GROUSE.

ONE of our most excellent contributors, "Homo," whose articles are always so much esteemed by our readers, has sent us a communication with the above heading, which we give in full herewith. Gentlemen abroad are directing their attention to the introduction of this very same bird—the pinnated grouse, or prairie chicken—and numerous inquiries have been sent to us from England in regard to their habits.

In the last number of FOREST AND STREAM we gave in a short paragraph an account of how pinnated grouse are now being successfully raised on Long Island. Our correspondent, who is fully informed as to the prior history of the birds, is perfectly right when he states that pinnated grouse existed many years ago in New Jersey.

The plan proposed by "Homo" seems most excellent, and we believe to be easy of execution. We look at these matters not only with an eye to the pleasures of the field, but because they may be made productive of great good to the community at large. Any one who succeeds in introducing game birds or animals into regions where they did not exist before has an equal merit with him who makes two blades of grass to grow where but one grew before. Experiments of this character are novel in the United States. We have been placed in such a fruitful soil, teeming with birds, beasts, and fishes, that of late years we have been careless, indifferent, and even culpably reckless in regard to them. It is the problem of the nineteenth century to create what has been so ruthlessly destroyed. The time will come when even the last of the pinnated grouse on the prairies will be shot. It behooves us, then, as the game is being exterminated in the far west, to reproduce it again in the nearer east. HOMO writes:—

EDITOR FOREST AND STREAM:—

Many years ago the pinnated grouse, or prairie hen (*Tetrao Cupido*), frequented Long Island in considerable numbers, and was found on that tract of country situated between Hempstead Plain, on the west, and Shinnecock Plain, on the east, and the bird was then known to the inhabitants as the "heath hen." This district was covered with stunted trees, shrubs, and smaller plants. The trees, mostly of small growth, were pitch pine and white oaks of inferior size, exactly resembling the scrub and barren regions of the lower counties of New Jersey. The pinnated grouse once thrived on Martha's Vineyard, the country likewise of the same character, and we read of its having years since bred on the brushy plains of Burlington county, New Jersey, and in the scrub oaks of Pocano, in Northampton county, Pennsylvania, and the barrens near the town of York, in the same State.

The total extinction of this noble specimen of the grouse family in the east can be attributed directly to the lack of proper protective laws in their behalf; the shooting of the young birds was allowed at any time, and the persecution began as early as June and continued each year until the pinnated grouse now cannot be found nearer than the great grass plains of our western States. In the counties of Burlington, Cape May, Atlantic, Cumberland, and Gloucester, of New Jersey, excellent ground, well adapted to the introduction of the prairie hen, can be found large tracts of barrens, almost devoid of water, and overgrown with stunted oaks, ferns, and whortleberry bushes, in which I am satisfied they would thrive and increase.

I have been urged by a prominent member of the Philadelphia Sportsman's Club, well informed as to the habits of this bird, to make use of your columns as a medium for calling the attention of the several game protective societies and sportsmen clubs of New York, Pennsylvania, and New Jersey to the fact that we have almost at our very doors a fine field for the initiation of an enterprise for restocking barren grounds with the prairie hen. When it is known that the bird once afforded fine shooting in the very regions spoken of, the success of the "replanting" of this game will not admit of a doubt. It is proposed that a fund be raised by the different clubs, and a competent person be sent west to purchase a sufficient number of both the pinnated and sharp tail grouse to stock the counties to be agreed upon, and in which the societies are most interested; the birds carefully cooped in pairs in low boxes with padded tops, and on their arrival let out in such a manner as not to have them pack together, but to breed during the first season. A law guarding the grouse for five years would then be necessary, and a prohibition against shooting them, when the five years have terminated, before the 15th of September and after the 1st of January in every year should be passed. We could then enjoy "chicken shooting" without seeking it hundreds of miles westward.

WHERE OUR FURS COME FROM.—The Ottawa *Citizen* mentions the presence in town of a Mr. P. Stearne, of Adams, New York, who is buying up furs for the American market. He takes away from Canada every season \$120,000 to \$150,000 worth of furs and peltries. Mink are now worth from \$2 75 to \$3 for average qualities of Canadian mink, and \$3 50 to \$4 for prime dark mink; prime muskrat, large, fall catch, 12½ to 15 cents; martin, \$2; otter, \$8 to \$10; beaver, \$2 per pound; fisher, \$7 each; fox, \$1 50. During two days Mr. Stearne shipped to Leipzig 50,000 muskrat skins. Speaking of the fabulous value of black fox skins, Mr. Stearne says that he has never seen one in that section. They come from Labrador or Hudson's Bay. One was caught in Malone, New York, two years ago, and the skin sold for \$100. He gets but four or five silver grey fox skins each year. A year ago there was a great demand for this kind of fur for trimmings on velvet and seal; but this year it went out of fashion, and skins that used to bring \$500 are not worth more than \$35 or \$40 this winter. It is a fancy article to deal in. The best furs come from the Gatinian, Lievres, and Temiscamingue. Mr. Stearne says:—

"I find that there is not as much fur shipped from Canada now as there used to be. The people here, like in the United States, are becoming more wealthy and fashionable, and wear fine fur themselves instead of sending it to Europe. We ship large numbers of muskrat to the old country. The catch of Canada and the United States of muskrats is about five million skins annually; of that number two millions are caught in Canada. Western mink we generally send to Europe, as it is inferior; the finer kinds sell better in this country. In fact, we import the finest skins from the Hudson's Bay stores in London. The best otter we get is from below Quebec, where it is larger and blacker than it generally is here; fisher is also better at Quebec. The muskrat we get here is much finer than

what we get along the St. Lawrence, but the skins are smaller. We used to pay higher prices for them here, but since the art of coloring furs has been brought to such a perfection we pay more for size than for color. Beaver is lower this year than it was last. It was used extensively for trimming ladies' seal jackets; now they use the seal without the beaver trimming. Skunk and racoon skins we get principally in Ohio, Indiana, Michigan, and New York States. These furs are much finer and darker in the United States than in Canada, although mink, martin, otter, etc., are much coarser than in Canada. Large quantities of coon skins are brought over here every year from the United States to be worked into fur overcoats. Mr. Stearne says one of the best recipes for preserving furs from moths is simply to pack them in a box lined with tar paper, such as is used for roofing."

THE PTARMIGAN, (*Lagopus vulgaris*).—This beautiful bird, with his snow-white winter plumage, contrasting with the black on the tail feathers, with the peculiar feet all covered with down to the end of the toes, is now coming in quantity into our markets. Some years ago a few pairs only were seen, but to-day many thousands are shipped from Labrador and Northern British America, to add to the long list of game birds required by omnivorous New York. The birds are collected at Montreal, from whence they are shipped to our large dealers, and will continue arriving from now until the end of April. If the history of the methods of transportation of these birds could only be told, they would repeat the story of the "Lone Land" so graphically described by Captain Butler, of dreary, solitary wastes of snow, of the long tramp in icy Labrador, or Ruperts Land, of the dog-sled, of trading posts far away from civilization. We have shot many a ptarmigan when journeying from Churchill River to Great Bear Lake, and also collected them in Labrador for mounting. We did not think them hard birds to kill; though flying faster than the pinnated grouse, they were not as rapid as the ruffed grouse. As food, we found them excellent, though during mid winter, from feeding on the laurel, they were a trifle bitter.

OBITUARY.—There died at Vernon, Conn., on the 13th of March, aged sixty-three, Christian Sharpe, the inventor of the Sharpe Rifle. To wonderful ingenuity Mr. Sharpe added a singular amount of patient toil and industry. His reputation as an inventor must not rest alone in the ingenious system of breech-loading, which originated with himself. Sharpe twenty years ago fully appreciated the future of his arm of predilection, the rifle, and we believe him to have been the first person in the United States who insisted that metallic cartridges, (an idea at first thought impossible,) would in time be the necessary adjunct of all breech-loading arms. Christian Sharpe, with Samuel Colt and Elias Howe may be considered as among the greatest of the inventors of the last fifty years.

—We have had the pleasure of a visit from Theodore W. Sterling, Esq., of St. Louis, whose name is familiar to our readers, as having been prominent in the organization of the Missouri Association for the protection of game. A thorough acquaintance with the birds, beasts and fishes of the West, has made Mr. Sterling one of the strongest advocates of our comprehensive system for the preservation of game in certain geographical zones, as fully detailed by us in our last number. Mr. Sterling is now on his way to Europe, and whilst in England will witness some of the coming field trials. It is the intention of this gentleman to purchase some of the best stock of pointers and setters for introduction into the United States.

—We particularly call the attention of our readers to the advertisement of the well-known house of Lord & Taylor. The sportsman can find there the flannel shirts fitted for the woods, and even the daintier yachtsman can get there the finer linen, to be sported on festive occasions. Those who indulge in cigars can buy of Lord & Taylor their smoking jackets, and those given to billiards, their billiard jackets. Messrs. Lord & Taylor have a kind of universal establishment. You can get any kind of an outfit there you desire if you are a man, and should you have a wife—why, we fancy the lady could be suited with all that is gorgeous, beautiful or in good taste, in the way of dresses.

—The plan of the Agassiz memorial committee of Boston contemplates the permanent endowment of the Museum of Comparative Zoology at Cambridge, requiring at least \$300,000, about one-third to be used in enlarging the building, and two thirds to be funded. Subscriptions may be sent to S. B. Schlesinger, 6 Oliver street, Boston. A large sum has already been raised.

—Already many changes have been rung upon our story of the "Oyster Fiend," and now a very clever version appears in the *Amherst Student*, quite as good, perhaps, as the one that was written for us by our own correspondent J. B. Matthews, in Vol. 1, No. 24. It is long, but we may find room for it some day.

NEWFOUNDLAND.—As will be seen in a letter printed elsewhere, we shall soon begin the publication of a series of articles describing the interior of Newfoundland, of which the world now knows nothing.

—Mr. Chadwick, the author of the Standard Base Ball Books of America, was the recipient of a special resolution of thanks from the recent Base Ball Convention in Boston for his revised code of rules of the same which the Convention adopted almost as a whole. He has also written a new base ball book for England, which Messrs. Routledge, of London, will publish in April.

Sporting News from Abroad.

—If the name of Admiral Rouse does not go down to posterity, as among the most famed of English sailors, at least it will have some notoriety as belonging to a distinguished turfman. This doughty racing seaman comments upon that constant cry, "that the breed of the horse is deteriorating in the old country." The Admiral declares that this story, like that of "wolf, wolf!" is centuries old, and that in 1756 precisely the same thing was said. He then pours a broadside into those who preach "the deteriorating horse theory," calling them "persons qualified for a lunatic asylum," and that the idea they advance is "absurd nonsense." He states that there are to-day in England "two thousand more horses running longer distances and carrying heavier weights than there were twenty years ago, and that in France and Germany the cleverest and most successful sportsmen run two year olds for the earliest spring races without damage to their future prospects." The Admiral being then strongly in favor of racing two year olds, argues that this running of equine babies, is the only way in which young horses of merit, strength and bottom can be culled from the general herd, and he endeavors to show how in modern racing history, we are even much more humane than were the turfmen of old, because we discard to-day the long distances horses used to run, distance being with our grandsires the great criterion of the value of the horse. The Admiral's rather positive ideas are met squarely by his opponents, who, adverse to two year old racing, assert that it is unnatural, and that though from time to time we may get up both speed and endurance in very young horses, whose frames cannot be thoroughly matured, it impairs the future usefulness of the horse and prevents his becoming the origin of a noble race of future animals. Fashion, speculation, the pockets of the trainer, have a great deal to do with this subject of running two year olds, because they do not like to have their capital remain dormant until the horses they are working have arrived at a proper age. We never can be made to believe that Admiral Rouse or any body else, even by the most careful and judicious training or selection can run counter to nature's laws, whether it be to make a child of ten years' old do the mental or physical labor of the young man of twenty, or a two year old horse the work of an animal of four or five years' old. As to gambling on race horses, Admiral Rouse says: "Racing has been and always will be in the United Kingdom a gambling speculation." He tells us too, "that in his time gambling at races has fallen off fifty per cent, but that turf morality has improved and the greatest gamblers are men who never kept a race horse or subscribed to a plate, and who occasionally send from £5,000 to £10,000 into the market to back a Derby horse, and the stigma of excessive gambling is accredited to the turf." If in England gambling at races has gone through its transition period from being very bad to something better, (if better it can be,) as we have just started it in the United States on the improved English style, with "books" and all that kind of thing, we may expect at least for the present, a pretty state of things, until we arrive at that higher stage of turf morals which Admiral Rouse seems to intimate is possible.

—Pisciculture in Scotland, particularly directed to the preservation of the salmon, is giving the grandest of results. Salmon have never been so plenty in the London markets. Some years ago they were worth five shillings a pound, and to-day the editor of *Land and Water* says he has bought salmon at a shilling a pound. Later accounts tell us, too, that English waters have also their salmon harvest, the take in the first fortnight being large beyond all precedent. Not only is the quantity most notable, but the increase is in the size. At Bolton a forty pound fish was caught, at Worcester a thirty-nine pound one. Please gracious, the time, we trust, is not far distant when salmon will be quite as abundant and even cheaper on this side of the water. Then again we have to herald what seems to be the very first catch of salmon in Tasmania, the reward of thirty pounds for the first fish having been claimed for a grilse of almost three pounds, caught in a tidal pool of the River Derwent. English trout, thanks to the exertions of Mr. Francis Francis of the *Field*, and of Mr. Frank Buckland of *Land and Water*, have been raised in New Zealand. We believe that in Australia our California salmon would do better than their Scotch fish. The Tasmanian salmon is another plume in the caps of the Pisciculturists.

THE IRISH RIFLE MATCH.—The president of the Amateur Club who have taken up the Irish challenge, has received the following letter from Messrs. E. Remington & Sons:—

ILLION, N. Y., March 14, 1874.

COL. GEO. W. WINGATE, Esq., President Amateur Rifle Club, New York: DEAR SIR—The action of the Amateur Rifle Club in accepting, on behalf of American riflemen, the challenge from the Irish eight, who won the Elcho Shield at Wimbledon, in 1873, is one that should recommend itself to all. We feel confident not only that riflemen can be found in America who are as skillful as any who have appeared at Wimbledon, but that our American rifles need fear no comparison with the Irish "Rigby," or with any other rifles of foreign make. Although your club is comparatively young, you have shown a proper spirit in accepting this challenge, and it is proper that all who are interested in sustaining the reputation of this country as the home of the rifleman, should aid and assist you. As an earnest of the interest with which we regard the undertaking of your club, we request them to accept the enclosed check for \$250, as our contribution toward their expenses in connection with this trial of skill. Yours very respectfully, E. REMINGTON & SONS. W. C. SQUIRE, Secretary.

We believe we can state on the best authority that, with his usual liberality, James Gordon Bennett, Esq., will offer a very handsome amount of money, to be used as prizes for the future rifle contests at Creedmoor of the N. R. A.

Shot Gun and Rifle.

GAME IN SEASON FOR MARCH.

Snipe, Brant, Ducks and Wild Fowl generally.

FOR FLORIDA.

Red Deer, *Caracus Virginianus* Wild Turkey, *Meleagris gallopavo*.
Woodcock, *Philohela minor*. Quail, *Oryz Virginianus*.
Snipe, Plover, Curlew, etc., in great variety.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

—The weather continues too cold for snipe and bay birds, and checks the migration of wild fowl. Of snipe shooting in the vicinity of New York we can only speak in general terms, for our "cutest" sportsmen are jealous of the information they possess; and even were we to specify good localities, the chances are ten to one that the stranger who would seek them out would find some market gunner or veteran bird hunter in snug preemption and possession of the best points and thoroughfares, and whom courtesy and the rules of the craft hold safe from others' intrusion. Still there are places on the south side of Long Island where the bays and creeks cut deeply into the marshes, where inlets divide the outer beach, and where "thoroughfares" or necks of land connect the outer beach with the main land, and convenient to these localities, which the snipe and bay birds frequent and traverse like a beaten track, are queer old chaps with keen blue eyes and bronzed cheek bones who keep stools on hand, and have their blinds ready for favored city gents who are willing to pay to the gunner the market price of every snipe they shoot! Oh yes! it is all very well to ask, "where shall we go to shoot snipe?" but if the dozen or score of questioners who address us can find any fuller, more definite or more honest information than we give them, we shall be pleased to become joint possessors of it. We shall state, however, that Sheepshead Bay and New Rockaway, the points most accessible to New Yorkers, and once famous for their abundance, are still much resorted to by gunners, parties of whom have been scouring the marshes for signs the past few days. Take the branches of the South Side railroad, and ask for Abrams. If you can find a soft spot in his conscience or nature he can be of great service. He bags for the Robinses in Fulton Market. At Oyster Bay is a grand natural snipe ground, and, indeed, the whole series of salt meadows that extend to Patchogue are hard to beat for snipe and bay birds. On the Jersey coast from Shark's river, below Long Branch to Toms river, Squan Beach, Barnegat, and all the way to Atlantic City, the snipe ground is fine, and many a choice locality, perhaps the best that can be found, may be reached by driving over in a wagon from any given station on the line of the Southern New Jersey railroad. Philadelphians, who are natural meadow rangers, seek the Jersey coast in large numbers, and are well acquainted with the ground.

Perhaps it would be judicious advice to those not well informed to study out the lay of the land by a county map, and having selected a place that seems suitable, "go for it," and when there interview the outlying settlers and get by fragments the information required. At all events, if one does nothing more than reconnoitre the first season, the time is not wasted, for he will most certainly become privy to some choice locality which he can visit when the next season comes around.

The spring season for snipe is short at its longest, covering a period of ten days or so. Neither are the birds as fat as in the fall when they linger at favorite feeding grounds in their migratory flight, dallying by the way. Now their flight is rapid, for they are off for the north "on business," and have no time to spare in wayside indulgences. Those who would boast a full bag must therefore be on the alert, and when the first warm breezes blow from the southward be up and ready, and have at them, boys!

South Oyster Bay, Tom's River beach, and the shores of Barnegat are lined with wild geese resting a brief period on their long journey north. As they are migratory birds, swing out your eight and ten bores, and render an honorable account of yourselves.

English snipe, that rare and much prized game bird, will also soon put in an appearance—certainly by the first of April. For an intelligent article on the same, see communication from our correspondent, C. B., in this day's issue of FOREST AND STREAM.

—On the 1st instant Mr. Nat'l Berry, shooting at Craney Island, from box killed eighty black and red heads and canvas backs—a day's work.

—Ducks are very plentiful on the Potomac. One day's shooting last week at Pencoast, off Navy Yard, killed fifty odd.

—A young man was hunting at Bluff Point, Keuka Lake, Yates Co., the other day, and had his dog out. Soon a fox was started, which came down on the west side of the point. When part way down on that side of the hill the fox turned back, and the young man crossed over the point again to head the fox and kill him. In a short time the dog was heard coming, and in a few moments the fox made his appearance, coming down from the south. The hunter, concealed behind a stump, raised his gun to fire, but it snapped. The fox not hearing the report of the cap came and jumped upon the very stump behind which the young man was concealed. He quickly seized the fox around the neck with both hands, held him fast, and carried him home, leaving his gun lying by the stump in the woods.—*Ontario County Journal*.

—A party of northern gentlemen sojourning at Jacksonville, Florida, last month, took a hunting trip up the Ocklawaha and returned to Palatka on the 18th, with the following report of the results of their eight days' trip: Alligators seen, 243; killed, 79; limpkins killed, 130; water turkeys, 25; great heron, 4; white heron, 2; painted gallinelli, 20; coots, 150; eagles, 4; great owls, 2; black bass taken, 150 pounds.

—At Ship Harbor, Nova Scotia, a black bear was killed a few days since that weighed over 700 pounds, which is a weight most extraordinary.

—We have to thank a friend in Brainerd, Crow Wing county, Minnesota, for some very clever photographs. Two of them represent the heads of deer with antlers locked in deadly combat, the pictures being taken from life. The third shows a deer's head with antlers with a triple horn on one side, which is very novel. The FOREST AND STREAM album, quite a large one already, promises to make a most interesting collection, and will serve not only to illustrate the beauties of Nature's creations, but will help to remind us of the kindness of many of our correspondents.

BLOOMING GROVE PARK.—The following board of directors has been elected for the year: E. R. Wilbur, New York; Edgar Pinchot, Milford, Penn.; Fayette S. Giles, New York; Saunders D. Bruce, New York; Dudley Field, New York; Charles Hallock, New York; John Y. Cullyer, Brooklyn; Thomas N. Rooker, Brooklyn; Genio C. Scott, Brooklyn; John K. Hackett, New York; John B. Sartori, Philadelphia, Penn.

OUT OF PLACE.—Sometime ago in London streets a woodcock deliberately flew into a cabman's hands, which fact was duly recorded in public prints. We can, however, beat that. One day last week a wild turkey was seen perched on a chimney, on Gouverneur street in the wilderness of this City of New York. Then Madison and Monroe streets showed their sportsman-like proclivities, and from garret and attic an active fusillade was carried on. Again and again the game broke cover, but at last Madison street got the better of the noble bird, and the turkey fell. One question is where did the turkey come from? and the other is, is not March a close season for wild turkeys? Let our most worthy Association for the protection of game look to it. We shall be killing catamounts and lucifees on Fifth Avenue, and potting ducks and geese in the new fountain at the city Park.

—The White Cloud Sportsman's Club of White Cloud, Kansas, have elected the following officers for the ensuing year: President, D. C. Taylor; Treasurer, I. C. Orton; Secretary, I. M. Mackoy. We would call the attention of sportsmen's clubs to article 7 of constitution of this enterprising Association. Article 7 "That the position for trap shooting shall be with the muzzle of gun below the knee and hammers down hammers, to be raised after the bird or birds come in sight."

—The following amendment to the game law of New York has been read twice and referred:—

SEC. 1. No person shall kill or chase any moose or wild deer in any part of this State save only during the months of September, October and November in any year. No person shall sell, expose for sale, transport, or have in his or her possession in this State after the same has been killed, any moose, wild deer or fresh venison, save only during the months of September, October, November, December and January. No person shall, at any time, in this State, kill any fawn during the time when it is in its spotted coat, or have in his or her possession the carcass, flesh or skin of such fawn after the same shall have been killed. No person shall, in any part of this State, set any trap, spring gun or other device at any artificial salt lick or other place, for the purpose of trapping and killing any moose or deer. It shall not be lawful to pursue deer with hounds in the county of Steuben. Any person offending against any of the preceding provisions of this section shall be deemed guilty of a misdemeanor, and in addition shall be liable to a penalty of fifty dollars for each moose or wild deer or fawn, so killed or pursued or trapped, and for every spring gun so set, or moose or wild deer or fawn skin or fresh venison had in his or her possession, and may be proceeded against therefor in any county of the State in which the offender or prosecutor may reside. It shall be lawful for any person to kill any dog chasing moose or deer out of season, and the owner of such dog or dogs, and those putting them on the scent, shall be liable to a penalty of ten dollars for such moose or deer so chased or killed by such dogs.

SEC. 2. This act shall take effect immediately.

—The Philadelphia Amateur Shooting Club shot their first match at pigeons recently. This is a new club, it being the first time some of the members ever shot from a trap. The match was composed of eight men on a side, ten birds each; Rhode Island rules. The following is the score:—

Wm. Cummings.....1111111010-8	M. Brierly.....11111111110-9
W. E. Van Orsdel.....0111111010-6	Wm. Bogarth.....1100101010-5
F. Wedmayer.....1110111011-8	Wm. J. Givens.....0101001110-5

Total killed.....51	Total killed.....48

A. C., President P. A. S. C.

—The Schuetzen Park Association, is a well-to-do association. Assets of the association amount to \$239,593, and expenditures during the year are almost \$110,000. Without their losing their national German character, (which in many associations is vital), why cannot our German riflemen be made to affiliate with Creedmoor and the American Rifle movement? The time of the Swiss or German rifle has passed away, with the cross bow and match gun.

THE INTERNATIONAL RIFLE MATCH—ADDRESS TO AMERICAN RIFLEMEN.

A meeting of the Executive Committee of the Amateur Rifle Club was held at 194 Broadway, on Wednesday, to consider the programme of the proposed match between American riflemen and the "Irish Eight." The expenses of the match, including the forfeit of £100, were estimated to be not less than \$1,000, but it was announced that the club had received such assurances of financial support in the undertaking as to remove all question upon this point. The committee then decided to accept the programme as forwarded, with the single exception that the number of competitors upon each side should not be less than six, and directed the President of the club to inform Major A. B. Leech, the Captain of the Irish Eight, of this determination.

It being desired that this match should be participated in by riflemen throughout the country, the following address was adopted by the committee and directed to be issued:

NEW YORK, March 11, 1874.

TO THE RIFLEMEN OF AMERICA:—

A challenge having been extended to you by the Irish Eight (who won the Elcho Shield at Wimbledon in 1873), the Amateur Rifle Club of this city have accepted it upon your behalf.

The programme submitted by the Irish team has been agreed upon with the single exception of the minimum number of competitors, which this Club desire to fix at six, in place of four, as originally proposed by the challengers. As thus amended it is as follows:

Programme of the International Rifle Match between the riflemen of the United States of America and the riflemen of Ireland, represented by a team to be chosen from the members of the Irish Rifle Association, to take place at Creedmoor, Long Island, not sooner than the 15th of September or later than the 15th of October, 1874, on the following terms, viz:

Team—Each team to consist of not more than eight or less than six men, at the option of the Irish, whose decision will be announced on their arrival at New York. The American team to be composed exclusively of riflemen born in the United States. The Irish team to consist of men qualified to shoot in the Irish eight at Wimbledon.

Rifles—Any, not exceeding ten pounds weight; minimum pull of trigger three pounds. The Americans to shoot with rifles of bona fide American manufacture. The Irish to shoot with rifles manufactured by Messrs. John Rigby & Co., of Dublin.

Sights, Ammunitions, Targets and Marking—To be according to printed regulations in force at Wimbledon 1873.

Ranges—Eight hundred yards, nine hundred yards, and one thousand yards.

Number of shots—Fifteen at each range by each competitor.

Previous Practice—The Irish team to be allowed the use of the range for practice for at least two days before the match.

Position—Any; no artificial rests to be used either for the rifle or person of the shooter.

Mr. Leech, on the part of the Irish team, guarantees to deposit, on his arrival at New York, with the National Rifle Association of America, the sum of one hundred pounds sterling, a like sum to be deposited by the American team, and this sum of £200 to be handed over to the Captain for division among the members of the winning team.

Targets, ranges, and all accessories for carrying out the match to devolve on the Americans. The Americans to choose a referee to act for them. Mr. Leech will act in the capacity of referee for the Irish team, and the two referees shall mutually select an umpire, to whom, in case of difference of opinion, they shall refer, and whose decision shall be final.

The terms of the match to be signed by Geo. W. Wingate, on behalf of the Amateur Rifle Club, and by Arthur Blennerhasset Leech on behalf of the Irish team.

Duplicate copies of this programme to be exchanged, and all necessary arrangements to be completed on or before the 1st day of June, 1874.

Should either team fail to make appearance on the day and hour agreed upon for the match, the team then present may claim the championship and stakes.

In taking this step, the American Rifle Club do not claim that they include among their members the best riflemen of America, but only assume to act as your representatives for the purpose of placing the matter in such a shape as to permit all, who prove themselves competent, to compete, irrespective of their residence or membership.

The targets and scoring used in the match will be in accordance with the rules of the National Rifle Association, viz: Targets six feet high by twelve wide, having a black bull's eye three feet square, surrounded by the "centre," six feet square, the rest of the target constituting the "outer;" bulls' eyes counting four points, centres three, outers two. Any sights allowed but telescopic, magnifying, and such as conceal the target so as to prevent the danger signal from being seen. Any ammunition may be used. Any position will be allowed which can be taken on level ground without artificial rests. The other particulars sufficiently appear in the programme.

It is requested that all native-born Americans who are interested in rifle shooting and who desire to form part of the "team" which is to represent America in this match, will at once commence practising for the purpose, and will, on or before the first day of July next, forward to the subscriber a score of fifteen consecutive shots made at each distance named in the programme, in the following form:—

I, A. B., hereby certify that the following is a correct statement of fifteen consecutive shots made by me at 800, 900 and 1,000 yards, at —, on —, 1874, without any artificial rests, telescopic or magnifying sights (target 6x12 feet; bull's eye 3 feet square, centre 6 feet square; bull's eyes counting 4, centres 3, outers 2):

At 800 yards.....total	—
At 900 "....."	—
At 1,000 "....."	—

Grand total..... Rifle used, —; weight, — lbs. (dead weight, without set or hair trigger).

I further certify that I was born at —, State of —, U. S. A., on —

Signature, — Address, —

Sworn to before me, —, 1874.

Notary Public (or other officer having similar powers). At some time during July or August, to be hereafter designated, one or more matches will be held at Creedmoor to shoot for places in the team. Notice of these will be sent to all forwarding these returns, as well as to the regular members of the club, and all, whether members or not, will be allowed to compete at them upon equal terms. From the competitors making the best scores upon these occasions the Executive Committee will select a certain number who will shoot against each other until the best shots are definitely ascertained; and these, and these only, will be allowed to shoot in the team. The Amateur Club will provide the markers and pay all the expenses of these matches. Non-members of the National Rifle Association will, under its rules, be required to join it before practicing upon its range at Creedmoor. This, however, will cost but \$3, and will be the only expense they will have to incur.

The matter is one that appeals so strongly to your pride, not as riflemen, but as Americans, that it is to be hoped that the best shots in the country will come forward in this match. The gentlemen who have sent the challenge are very skillful riflemen (their average score in the match for the Elcho shield being 149.37 points out of a possible 180, or 3.32 a shot), but there are many in America fully as expert, and if they can be induced to engage in the undertaking the result cannot be doubtful.

By order of the Executive Committee.

FRED P. FAIRBANKS.
Secretary Amateur Rifle Club.

—We take the following from the *Irish Times*:—

The International Rifle Match between Ireland and America will take place in the course of the coming autumn, and we trust it will be followed by a return match between the rivals at the Curragh, the Phoenix Park, or Dollymount. The contest, it will be seen, is not only between the best American marksmen and the best Irish champion shots, but between the rifles made by John Rigby, of Dublin, and those of the most celebrated American makers. It will be no trivial honor should our team succeed in establishing on the other side of the Atlantic their own fame as unrivalled marksmen and the superiority of the Dublin Rigby guns.

—On the occasion of the departure of Earl Spencer, Lord Lieutenant of Ireland, for England, on the 26th of last month, he was the recipient of a most flattering letter from the Irish Rifle Association. Earl Spencer and Lady Spencer, it seems, have, by their presence and personal exertions, did a great deal to encourage Irish riflemen.

GALLERY RIFLE SHOOTING.

WHAT IS THOUGHT OF RIFLE TOURNAMENTS OR SMALL-BORE PRACTICE AT SHORT RANGES IN ENGLAND AND IRELAND.—There is, it appears at New York a rifle gallery, at which much shooting of the most accurate description takes place at the range of seventy-five feet. This is, we suppose with that pretty toy, the Carbine Flobert, or as we call it, the saloon rifle. We conjure the American riflemen to give up such vanities, and to confine their shooting to the open range, and to something like reasonable distances. It may be very difficult to make bulls-eyes at a vibrating bullet at five and twenty yards, but such practice will never make a rifleman in any true sense of the word.

The above appeared in the *Volunteer Service Gazette* of February 27th, 1874, in regard to the Conlin Tournament, full notice of which has appeared in our columns. Differing from the opinions advanced by our English contemporary, one of the most distinguished members of the Irish Rifle Association has sent to the *Volunteer Service Gazette*, the following, a manuscript copy of which was also forwarded by the same gentleman to ourselves:

DUBLIN, February 26, 1874.

EDITOR FOREST AND STREAM:—

The proper object of criticism is the removal of error, and it usually precedes advice whose intention is to benefit the recipient.

These remarks are suggested by a criticism in your gazette of the 21st inst. on Gallery Rifle Shooting in New York, as reported in an American sporting paper. The gallery rifle matches reported took place in the depth of an American winter, when the rifle ranges were closed and all out-door practice suspended. Under such circumstances the rifle gallery supplies an excellent means of teaching much that our position and aiming drill, snapping caps, &c., is intended to inculcate. The position cannot be bad, the eye and finger must work well together, and the trigger pull must be almost perfect to enable a man to shoot as recorded. In the absence of these qualifications no expenditure of ammunition at long ranges will ever make a man a rifleman in any true sense of the word. This very important consideration has been overlooked by your critic.

The writer also overlooks the fact that the rifle is used for other than military purposes, and that in America its use in the woods for obtaining food and the sports of the chase is of vital importance to a large section of the population. A short range, the utmost economy of ammunition, shooting from the shoulder, an extemporized rest, and extreme accuracy, without which the small projectile would be inefficient, are the conditions of this kind of shooting. To cultivate it in a shooting gallery should not, therefore, be ex-cathedra condemned as "vanity." To add that the excellent practice recorded was probably effected with a "Carbin Flobert" is much to over-estimate the powers of the French toy, and equally underrate the perfection to which American makers have brought their small bore rifles. To hit a three-quarter inch mark seven times consecutively at 25 yards, *off shoulder*, is little easier than to make seven consecutive six-inch circular bull's eyes at 200 yards in calm weather; and we know that with the finest match rifles and *any position*, it is not very easy to do this. To do it off shoulder is a remarkable feat.

I have the honor to remain your obedient servant,

OGILS.

[We agree perfectly with Ogils in his remarks. As may be seen, the best shots at 75 feet were those marksmen who are always in the lead at Creedmoor. The rifles used at the match were the Remington and Ballard. From our own experience we are ready to declare that it was about as difficult shooting as we ever tried our hand at.—Ed.]

BREECH-LOADERS.

NEW YORK, March, 1874.

EDITOR FOREST AND STREAM:—

I was lately requested by a friend to examine for him a new kind of breech loader, which he was about buying. I complied, and found the action much like many of the hundreds invented in the last fifteen years—neither better nor worse—and no improvement on the system as originally introduced. Still, it seemed safe, so far as I could judge without trial, and I told my friend he might safely make the purchase without fear of endangering his life. During my examination the dealer—apparently the chief man of the establishment—interfered, trying to con-

vince me of the superiority of his weapon, and asked me what gun I preferred. I told him, as I have told every one who ever asked my advice, never having seen any reason to change my opinion, but on the other hand having found much to confirm it, that I preferred the Lefauchaux principle. He coarsely replied that the Lefauchaux was behind the age, and that he could sell me one cheap. On my asking to see it the clerk handed me out a miserable, wretched apology for a gun, that was neither ever made by Lefauchaux nor even had the true action. That was the specimen kept by what is called a reputable house, in order to run down the credit of an established maker, and to induce ignorant purchasers to buy their patented invention. I handed the weapon back to the clerk, telling him it was an outrage that he should pretend to palm off such an abortion for a Lefauchaux gun. When they found themselves detected, neither master nor man attempted any defense.

My object in writing this is to warn your readers against such trickery, which I suspect has been successfully tried in more than one instance. The reputation of a good gunmaker is sacred to honorable sportsmen, and should be so among reputable dealers, even if they have inventions which they claim to be improvements. To injure another maker by such a subterfuge is not only disgraceful in itself, but argues badly for the workmanship of the men who would resort to it. I have never had the least interest in any patent or style of gun, except to see that it had fair treatment, and if I generally endorsed the Lefauchaux, it was because after having shot with it for nearly fifteen years, I have never found it to fail or leave me in the lurch, and in using that name I only do it to designate the character of break-off which, not being patented in this country, can be applied by any gunmaker here, and which has been adopted by so many of the manufacturers of England that one-half of all the guns made there are on the same system. I do not propose to weary your readers with a repetition of the arguments on the question, but merely to request them, before they condemn a gun with this name to be sure it is a fair and honest specimen, and not kept as a blind. Yours very respectfully,

ROBERT B. ROOSEVELT.

LOADS FOR RAIL SHOOTING.

PHILADELPHIA, March 9, 1874.

EDITOR FOREST AND STREAM:—

I do not agree with you that for rail shooting 1½ oz. of shot and 3 dr. of powder is the best load to use, for this reason that all rail are mostly shot within thirty yards of the boat, if at a greater distance it is difficult for the pusher to find, and as the rail is easily killed, I recommend the load I use myself, namely, 3 dr. of powder and ½ oz. of No. 10 shot. You will notice I use more powder in comparison to the shot than you. I do that as I have found out it is not the powder that makes a gun recoil but the shot, and to shoot about 100 times in several hours, it is better to lessen the recoil as much as possible. I will shortly answer my friend "Monmouth's" Virginia shooting with No. 10 shot. CAPT.

LOCKPORT, N. Y., March 9, 1874.

EDITOR FOREST AND STREAM:—

The Lockport Shooting Club was organized June 1st, 1863, with sixteen members, having a handsome club room. The winter following the building in which the club room was located was totally destroyed, including all the property of the club. Upon the rebuilding of the block, club rooms were fitted up expressly, and are now occupied by the members. During the first five or six years of its existence the club flourished bravely, and its members were nearly all good shots in the field. The winter of 1867 and 1868 was a very severe one, with large quantities of snow heavily drifted, and the quail (that had been annually plentiful the fall previous) were almost exterminated, so that since that time the club has had no annual shoots, and have discouraged all persons from shooting quail. The numbers of this game bird are now increasing.

On the first of December, 1870, the name of the club was changed to Lockport Shooting Club, and rifle shooters were admitted as members. The club has an excellent barricade about twenty feet long, eight feet high, and three feet thick, filled with broken stone, a good shooting house; range, forty rods, and its members generally use the Maynard rifle. With guns of this manufacture a turkey's head or a target one and a half inches in diameter, at forty rods is hit so often that with turkeys at \$1.00 each no one can afford to set them up at ten cents a shot, and out in the country turkeys are set up at 100 to 120 rods and no money made at ten cents a shot; 40-100 bore is the size used. The club has Bussey's patent gyro for trap shooting, and has one of the finest grounds to shoot on in the State, and is at present in good healthy condition.

The following is the list of officers for 1874: President, L. J. Peck; 1st Vice President, L. W. Bristol; 2d Vice President, W. A. Arnold; 3d Vice President, James Caster; Treasurer, J. R. MacDonald; Secretary, M. E. McMaster. This club has about thirty active members.

M. E. McM., Secretary.

PORTLAND, March 6, 1874.

EDITOR FOREST AND STREAM:—

The charter members of the "Maine Sportsman's Association" and their associates, to the number of twenty-three, met Thursday evening in the rooms of the Forest City Shooting Club, at Portland, to effect their organization.

Jonas Hamilton, Esq., President of the Forest City Club, was chosen temporary chairman and F. W. Smith temporary secretary, and Messrs. Manasseh Smith, Wm Lenter, Jonas Hamilton and F. W. Smith were appointed to form a code of laws, with instructions to report at an adjourned meeting.

There seems to be a rapidly increasing interest in sporting circles in regard to the protection of our game, and the passage by the Legislature of the stringent game law proposed by the Forest City Club, and of which Mr. Manasseh Smith of that club is the author, is a fair sample of the general awakening on this subject.

The first flock of wild geese passed over on Wednesday, March 4th, and the preparations for the spring campaign are in active progress.

F. W. S.

ELKHORN, Wisconsin, March 7, 1874.

EDITOR FOREST AND STREAM:—

The "Elkhorn Greenhead Club" was organized in July, 1867, with a membership of twelve sportsmen. The organization was truly stated in the preamble to our constitution, as follows:

"The undersigned hereby form themselves into an association, the objects of which are mutual improvement in the theory and practice of the sports pertaining to the gun and rod; the elevation of those sports to a higher known standard; the enactment and observance of such laws as will effectually preserve the game of the State from wanton destruction, and for the pleasures of social intercourse."

Our organization has been pleasant and from the sportsman's point of view, profitable. We have been able to secure a much wider observance of the laws for protection of game birds and fish than obtained formerly; although I regret to say that we have not accomplished all that we wished in this direction. We have a very nice collection of stuffed birds, a specimen of very nearly every variety of game bird killed in this section; these of our own capture, put up by a skillful taxidermist in Milwaukee. We keep a game score and have a record of each season's and each member's performance with gun and rod. Unfortunately, some of our most accomplished and enthusiastic members have acted upon the advice of H. G. and gone "West, young man!" which reduces our number, means and achievements somewhat; but there are still a few of us left, who strive to maintain the honor of our club. We get FOREST AND STREAM regularly through our newsman, and like it immensely. It has our best wishes for complete success. At last, election of officers S. F. Bennett was elected president, H. S. Bunker, vice-president, and E. B. Dewing, secretary and treasurer.

Ours is a small club and this country is too old for game, but I am satisfied that the effect of our organization has been good. There is much less shooting of birds out of season and a consequent increase of birds

in season. Our example seems to have more effect on comparatively lawless shootists than the law had before. The formation of sportsmen's clubs should be encouraged, for thus only in my opinion can we help to preserve our game birds and game fishes. Yours very truly,

E. B. D.,

Secretary Elkhorn Greenhead Club.

HUNTINGDON, Pa., March 10, 1874.

EDITOR FOREST AND STREAM:—

Yesterday was the time fixed for a match at rifle shooting for the championship of Central Pennsylvania, between McCarthy of Blair County, and Conrad of Huntingdon. The match was shot at Altoona. The terms of the match were twenty shots, off hand, open sight, at 100 yards, for \$200. The weather was fearful. Snow had, fallen on the preceding Saturday to the depth of six inches, and the hurricane that prevailed yesterday whirled the snow in all directions, making the targets at times invisible, and as there was no protection from the storm, the strings were fully double what they should have been. Conrad won easily, his twenty shots measuring 61 inches, while McCarthy's was 88 inches.

The Blair County men were still not satisfied, and made another match for \$100 on the same conditions, for ten shots. The wind had now steadied down into a plain, strong blow, and its effect on the balls could be better calculated. Conrad's ten shots only measured 12½ inches; McCarthy's, 30 inches. We do not shoot in this section much over one hundred yards, and our guns do not throw a large enough lead for the Irish Team at 1,000 yards, but if any of them, when they come over, feel like a match at 100 yards, we can accommodate them. Wishing success to FOREST AND STREAM, Yours,

"STANDING STONE."

Sea and River Fishing.

FISH IN SEASON IN MARCH.

Speckled Trout.	Salmon Trout or Teague.	Land-locked salmon
-----------------	-------------------------	--------------------

Exception is made in the State of Pennsylvania, where the close season does not end until April. In New York, the season begins on the 15th of March and in Massachusetts on the 20th March.

Pompano.	SOUTHERN WATERS.	Sheepshead
Snapper.	Trout, (Black Bass.)	Tailorfish.
Grouper.	Drum, (two species.)	Sea Bass.
Rockfish.	Kingfish.	
	Striped Bass.	

The annual opening of the trout season on Long Island is as great an event to the anglers of New York and Brooklyn as the exposition of spring bonnets is to the ladies expectant. In former years it occurred on the 1st of March; now it happens on the 16th, and as regularly as the blustering month comes around scores of the piscatory fraternity betake themselves to their favorite resorts along shore, arrayed in complete panoply of anglers' outfit, bristling with rods, and hung with fish creels roundabout—it is truth to say not so much in the expectation of taking full baskets of fish as for the sake of seeing and being seen, and to enjoy the sensation of a holiday reunion. For March is by no means proverbially a balmy and genial month. Sunny days are exceptional, and it often happens that the blue-nosed and benumbed disciples of Walton find the wood fires crackling within the cosy hostleries and club houses more conducive to comfort and general satisfaction than is a profitless whipping of ice-choked creeks and streams. Nevertheless, it is difficult to find an angler candid enough to confess that the opening of the season was not a success, or that he returned home empty handed. If he is asked by an inquisitive friend "what luck?" he will invariably answer half abstractedly that he had two pairs, a full hand, or three of a kind. If questioned as to the kind of flies he used he will be likely to reply that he used a *bottle fly*, or possibly, that he occasionally saw a cork fly. For, be it remarked, that while trout everywhere are distinguished as a *game* fish, those of Long Island are a peculiar kind of game. Hence, the fascination of fishing, and especially of fishing on the 16th of March. We have heretofore habitually attended at these opening seasons, and with varied experience. This year we were engrossed with business that demanded self-denial, and it was not without some feeling of disappointment and envy that we witnessed the departure last Monday of several scores of genial fly-tossers, bound east on a jollification. However, we venture to wager that, despite all disadvantages, we had just as good trout fishing in our sanctum, and equal luck; for we had scarcely entered the first stage of mourning over our adverse fate when lo! the express brought us an elegant eight ounce rod, manufactured especially for us by that careful rod maker, C. F. Orvis, of Manchester, Vermont. As Orvis does not supply the trade, but only fills orders, each rod is made under his own supervision, and so far as careful selection of material and accurate shaping and balancing are concerned, they seem to be as perfect implements as can be made of the kind. The one we have is a three jointed rod, German silver mounted, with ash but, and middle joint and tip of lancewood. Thus equipped, we required only the opportunity to test its merits, when presto! came a goodly box of genuine speckled trout from our friend Blackford, of Fulton market, fresh caught, and nicely packed in moss! What angler could have done better? On whom did propitious fate ever smile more graciously? *The first trout of the season!* How the sight thereof thrills the senses and sets anticipation all aglow! It is like the renewal of an old love. First strawberries, the first bud of spring, are nothing to it. The instant the prohibitory bonds of the law are loosed what a demand there is at once from all the epicures; what a rush from hotels and restaurants to all the markets! Early in the morning of Monday we saw at Blackford's great baskets filled with them, all alive, too, splashing in the water, and gleaming with iridescent splendor. Others were temptingly displayed on beds of fresh green moss; and of three hundred pounds which we saw thus exposed, one hundred and fifty were disporting in Long Island ponds at sunrise. Furman, the trout culturist of Maspeth, furnished the larger proportion; some came from the Richland trout farms, in this State, and others from Reedsburg, Mifflin county, Pennsylvania. A great many came from Montreal in a frozen state, and the lesser

price of these brought them ready sale. The chief purchasers of these delicacies are such leading hotels as the Gilsey, New York, Fifth Avenue, and Metropolitan, and restaurants like Cable's, Sutherland's, and Delmonico's. For the next thirty days the demand will be sharp in the daily proportion of one hundred pounds of fresh trout to three hundred pounds of frozen trout. The Long Island fish average about half a pound apiece, the heaviest turning the scales at a pound. The finest looking ones came from the ponds near Babylon. They are rather lighter or more silvery in color.

As the season advances, and the snow water passes out of the streams, we shall furnish our readers with weekly information of practical value as respects trout and trout fishing.

—Just at this season conger eels are being caught by our fishermen off the coast, and are brought in rather as curiosities than for use, as no one will eat them. We inherit in some way the same prejudices as do the English, and consider conger eels as worthless for food. Of late years, however, conger eels have come into more favor in Great Britain, and it is said that though too soft a fish to boil, when made into soup they form delectable food. Will somebody please try a conger eel chowder and let us hear about it? When caught with hook and line, it is about the most difficult creature to get rid of imaginable; the limberness and slipperiness of the common fresh water eel is nothing to it.

—There is a bill before the New York Legislature to prohibit fishing in Queechy Lake, in Canaan, Columbia County, for three years.

—The Forester Club of Penn Yan offer a reward of fifty dollars for the conviction of any person using nets of any kind in the waters of Oneida and Onondaga Lakes, or Keuka, commonly called Crooked Lake, for a period of ten years.

—A letter from Mill Village, on the Port Medway River, Nova Scotia, states that salmon began running up the river on the 25th day of January. "Saul," the Indian, (mentioned in Hallock's Fishing Tourist,) had taken several with fly. Selling price fifty cents per pound. This is undoubtedly the earliest fly-fishing of the season, and much earlier than is usual in the locality named, February being the customary month.

—A correspondent in Yarmouth, Nova Scotia, writes to say that in his opinion "Yarmouth County affords almost as good trout fishing as any other county in Nova Scotia. About six miles from the town we have the salmon river, which has a good many trout, although they are small. But four miles beyond that is the Tusket River, which is upwards of one hundred miles long. Two men from Boston Custom House were here last summer and carried home a bushel of trout as part of the result of their work. Two persons have caught five hundred trout in a day in the river. One hundred fish is not an uncommon catch for one man."

—G. H. M., of Baltimore, writing of the voracity of the trout, says:—

"I was fishing in Baltimore County and caught a brook trout, from whose mouth protruded the tail of a stone-head nearly five inches long; the head was partly digested. I did not weigh the trout but it measured just twelve inches. It had but one eye.

"In the same season I caught a brook trout, from whose mouth depended a cat-gut snood thirteen inches long; on dissecting him I found the hook firmly fastened in his stomach, yet he rose and struck with all the fire possible to a cold water drinker."

—Our Washington correspondent sent us the following notes one day late for last issue:—

Shad are being taken in small numbers as yet at Deep Hole, and in the market contrast well with the flabby Carolina shad, which have been on some time.

A few small cargoes of herring have been received at Alexandria. The systematic spring fishing has not yet begun, and the present cold snap will delay it.

At Harper's Ferry it is reported that black bass, salmon and trout are being taken. As these fish are the result of stocking the river, it seems as if some method should be pursued to prevent their unseasonable capture.

A large brook trout, the first caught since they were out in the river, was taken last week.

Young shad and herrings are beginning (they began a month ago) to make their appearance in the traps to the water mains.

On the 6th instant, thirty-five miles below Washington, seines were being hauled for rock fish with unusually good results. About eight or ten hundred bunches to a haul, averaging, say 1½ lbs. to a fish, six or eight fish in a bunch. Only three shad were taken and a few young sturgeon.

—A correspondent sends us the following notes from East Florida, March 5th, 1874:—

At Loud's Hotel, New Smyrna, are Messrs. Benson, of Brooklyn; Bruce, Lawrence, Hasbrook and family, and Captain Anderson and family, of New York; Messrs. Frost & Mann, of Boston; and Clarke, of Chicago; Mr. Cummings, of the New York Sun, with his wife, and Mr. Nevins, of New York, have gone south to Lake Worth. "Fred Beverly," of the FOREST AND STREAM, is at Fort Pierce on Indian River. Most of these in pursuit of fish, fowl and happiness.

The fishing at New Smyrna has been fair. Sheepshead have been the main reliance, but are now getting to be heavy with spawn. The redfish or channel bass are beginning to run, also salt water trout. Kingfish very plenty this season. Snappers and groupers are appearing, and the hooks and lines suffer in consequence.

March 1, five anglers out, result, 18 redfish, 10 groupers and snappers, 25 sheepshead, 33 kingfish, 20 pigfish and grunts, two or three sharks, also two deer killed by driving with hounds; turkeys scarce here this winter, also ducks. S. C. C.

—The Provincetown correspondent of the Boston Journal, March 5th, says:—

"The winter has been very mild and the fleet have been very successful. The quantity purchased and forwarded by the Old Colony Railroad and steamer during December, January and February was 4173 boxes of 425 pounds—1,773,525 pounds, an excess over last year of 1791 boxes, or 761,175 pounds.

The greatest drawback to the shipment of fish to New York results from the enormous commissions charged by dealers in that city, the business being controlled by a few. Freight to Boston, \$1 14 per box; to New York from \$2 to \$2 50. Commission in Boston 5 per cent., in New York 12 per cent. As the weather, so the price obtained in market for fish. In time it will be proven that the weather reports will aid the dealers in fresh fish quite as much as any class in this country.

Congress should establish a station at Highland Light. From no point on the coast would reports be more valuable."

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

CANOEING.

NUMBER TWO.

ADMITTING the canoe we advocate to be purely a traveling boat, we come to the consideration of her various requisites in model, material, build, internal arrangements, and rig. It is perfectly plain to us what we want as the result of our meditation and outlay in money—first, we want speed, both under sail and paddle; secondly, strength to stand the many knocks and thumps which are unavoidable in a long journey, and the strength of build and timbers which will keep the canoe perfectly tight, although subjected to the strain of sleeping in her; thirdly, we must have her just as light as is consistent with strength, and last, possibly least, but by no means an unimportant consideration, she must be handsome.

Experience is always a safe guide, and the number of canoes now in existence, constructed to meet various ends together with the record of their performances, makes it easy, for us to give such dimensions as we think will insure speed and comfort. For a man weighing two hundred pounds or under, and not over six feet in height, we should advise a canoe fourteen feet in length, twenty-eight inches beam at the bottom of the top strake and one foot deep, exclusive of the camber of the deck. Her water lines should be easy with little or no hollow. She should have a long floor and very little dead-rise. A keel of two inches or two inches and a half will be found sufficient, for with the weight of the canoeist and his stores she will go down to six or eight inches draft, and he will find that with the addition of the keel the canoe will have sufficient lateral resistance to do very creditably on the wind. There has been much ingenuity expended in endeavoring to invent some kind of center-board or lee-board, but with regard to the first, the center-board well is an insuperable objection, and we will venture to prophecy that the lee-board will be converted into kindling wood at the first camp by any canoeist who has indulged himself in the pleasure of shifting it over every time he tacked ship. Moreover, there is no necessity for either, and the canoeist soon condemns everything which is not absolutely an essential.

We specified the greatest beam of this canoe at twenty-eight inches at the bottom of the top strake; on deck it should be only twenty-seven, which gives a little of what is called "tumble home," which improves the appearance of the canoe and facilitates paddling, enabling the canoeist to bring his paddle closer to the side of his boat. In this connection it may be well to state that it is undesirable to increase the beam of the canoe unless absolutely necessary; to admit shoulders of vast dimensions to the privileges of the cabin it would have to be done of course; but when the canoeist is heavier than the limit we mentioned, 200 lbs., and is not all beam, it would be wiser to increase the length of the canoe to obtain the requisite floatation. A sheer of about seven inches forward and about four aft will add very much to the appearance and capabilities of the canoe. There should also be a camber or "crown" to the deck, which in the waist of the boat should measure at least three and a half inches. The arrangement of the well, hatches and sliding bulk heads, we hope to be able to show by the help of scale drawings, (which we are preparing,) very much more accurately than by any written description, and we now come to the method of build and materials to be used.

Weight is of course an important consideration in making portages, handling or moving the boat on shore, and of course the aim of every canoeist will be to have his vessel just as light as is consistent with strength. A canoe of the dimensions advised may be built with an oak keel, spruce stem and stern posts, planked with white cedar 3-16th of an inch thick, decked with Spanish cedar and having frames of oak, which will not weigh over fifty pounds, including the flooring boards, sliding bulk head tubes for masts hatches, and rudder.

We would advise however an additional weight of about twenty pounds by having the garboard strakes of oak, the

stem and stern posts of Hackmatack, the top strake of Spanish cedar, all the planking ¼ instead of 3-16th of an inch and the deck of double thickness abreast the well. The timbers should not be more than five inches apart in the waist of the boat where the canoeist sits, and need not be nearer than one foot, as the ends of the boat are neared. Of course our craft should be copper-fastened throughout. Reference has been made to mast tubes; these can be made of brass piping 1½ inches in diameter for the main mast, and 1¼ for the dandy mast; they should be firmly stepped in the keelson and cut off flush with the top of the deck; their object is to prevent the masts being converted into crow bars by the action of the water in event of a capsizing, and the light Spanish cedar decks being ripped into countless atoms should the masts become unstepped.

In finishing the hull sand paper and emery paper should be used without stint, and three coats of the best English copel varnish inside and out will give a very handsome and durable surface.

A NOVEL CHALLENGE.

WE have a challenge from an English officer stationed at Halifax, Nova Scotia, for a sort of scratch canoe race, extended to any member of the New York Canoe Club, the terms of which are stated incidentally in the following note. Should this tender meet with any indication of acceptance, we will publish at once a formal challenge from the author and give his name and credentials. It should be remarked here that he is the writer of the article which is concluded in our journal this week, entitled, "The Log of the Minnie." We hope our canoeists will consider this offer carefully, for whether beaten or not, they can learn much that will be to their advantage by making the acquaintance of the gentleman in question. Next week, we shall print an introductory article from his pen, to be followed by other practical essays on canoe construction and navigation, with sketches of prominent canoeists. We herewith append the informal challenge:—

HALIFAX, NOVA SCOTIA, }
March 11th, 1874. }

MR. HALLOCK, Dear Sir:—If any member of the "New York Canoe Club" would like to make a match for a "cruising race," I should be happy to have one next summer over an eight or ten mile course, with two or three portages, sail or paddle, or both, to be used at the discretion of the competitors. A good course could be laid down here, as there are lakes within a short distance of the harbor, on to which the portages could be made, and I would do my best to make his stay in Halifax pleasant.

Very truly yours, C. U. D.

—The Baltimore Canoe Club, the second organization of the kind in the United States, have just met together and formed themselves into an association for the purpose of promoting aquatic sports. R. Stewart Latrobe was elected commodore.

—The Bayonne and Pavonia Yacht Clubs have consolidated and adopted the charter of the former club. The name of the new organization will be the Union Yacht Club of New Jersey; they start under very favorable auspices, and many of the yachts have already shown good form. The record of the Meta, for 1873, was brilliant, and her owner, Commander Boling, is determined that the present season shall add to her fame. The names of the yachts belonging to the new organization are as follows: Addie, Addie Taylor, Annie Mac, Commodore, Eclipse, Elize, Emma Hilton, Frou Frou, Idle Hour, Irene, Jeanette, Meta, Minnie, Nellie D., Plover, and Qui Vive. Two new vessels are now building for the club.

—Mr. W. T. Sears, of the firm of Cummings & Sears, architects of Boston, gratuitously furnished the piano which has been accepted by the Yale Navy for their new boat house.

WASHINGTON, March 9, 1874.

The Analostan Boat Club, which is the oldest boating organization in the district, held its usual annual meeting last week, at which the election for officers took place, and the following gentlemen were elected for the ensuing year:—

President, Major M. Bailey; Vice-President, William N. Roach; Corresponding Secretary, J. H. Goodrich; Recording Secretary, A. B. Coyle; Treasurer, Tarble Dyer; Capt., O. L. Prescott; 1st Lieutenant, J. L. Robertson; 2d Lieutenant, Henry H. Dodge.

The report of Treasurer being favorable, the meeting was a happy one.

This Club is composed of a body of young men, representatives not only of the elite of Washington but of other States gathered here in the Government employ, among them are those who have served well in the war.

The boating season will be inaugurated about the 1st of April by a grand regatta, which is looked forward to with "great expectations." Among the fairest of the hundreds of belles who have agitated the pens of society reporters this winter, numbers are honorary members of this popular Club, as by a late election, is your correspondent.

PISCOC.

—The Oxford and Cambridge University Boat Race takes place on the Thames, London, on March 28th. The Pall Mall Gazette in speaking of the crews says "Cambridge's time of oars is not yet perfect; but though that is most valuable when it comes to racing, we think little of flaws in this respect a month before the race. There is a fair catch of the water, well laid hold of by the bodies before the slide commences. The sliding is good, if anything it runs a trifle into the 'opposite extreme to that which has murdered Oxford sliding, i. e., instead of coming too soon, it begins, if anything, a trifle too late;

but anything is better than the all slide and no swing style which Oxford showed last summer, and the Cambridge view of the question is after all a safe one. The recovery of hands from the chest is moderate; not so elastic as it might be, but taken all round the crew is as strong in material as that of last year.

Oxford, so far as material goes, are better than they were last year, but are not up to the promise that their trial eights gave. They also use their bodies better, swing longer and further back, and slide better than last year. There is a certain amount of body-work done throughout the boat, in addition to the slide. The crew is enormously weighted; a 12-stone 4-pound bow is a novelty, and one which we do not admire. Stroke is a comparatively untried man, and is the lightest in the boat. He has two strong men immediately behind him, but both of these slide too soon, and so do not take up his slide as well as could be wished. He does not go far enough back, but is anyhow longer than his predecessor of last year. Cambridge, though good in style, have two untrained men in the boat. Oxford, though rough, are fairly strong, and they have made such strides during the past month that it is on the cards that they may turn out something really good if they go on in the same way. The names and weights at present are:

CAMBRIDGE.			st.	lbs.
1. Hibbert (Lady Margaret).....	11	1		
2. Armytage (Jesus).....	11	4		
3. Peabody (First Trinity).....	11	12		
4. Aylmer (First Trinity).....	12	13		
5. Lecky-Browne (Jesus).....	12	4		
6. Reed (First Trinity).....	12	7		
7. Close (First Trinity).....	11	3		
8. Rhodes (Jesus).....	11	9		
Candy, (Caius,) cox.				
OXFORD.				
1. Stayner (St. John's).....	12	4		
2. Sinclair (Oriel).....	11	7		
3. Farrar (Brasenose).....	12	2		
4. Harding (Merton).....	11	7		
5. Williams (Lincoln).....	12	12		
6. Nielholson (Magdalen).....	12	3		
7. Keable (Wadham).....	12	1		
8. Courteney (Pembroke).....	11	0		
Smith, (University,) cox.				

—It will be seen that the average weight of the Oxford crew is about 173 pounds; that of their opponents 163 pounds. Both crews, however, are working hard, and the race will be an unusually good one.

Rational Pastimes.

RULES OF CRICKET.

ONE peculiarity of the Marylebone code of cricket laws is the odd way in which they are jumbled together, without any consistent system of arrangement. The fact is the rules are but little better arranged than they were for the period when a set of rules for school cricket were hastily put together. That such a code should so long have ruled a game which has arrived at the point of extended popularity cricket has, is surprising; but the wonder is the greater when the fact is considered that the existing code is the revised work of a party of such cultured gentlemen as compose the committee of the Marylebone Club, of London. Truly eustom is a great tyrant in England and it rules with despotie sway.

Our last article on the rules of cricket had special reference to the laws governing the delivery of the ball, and the last section of the rules commented upon was that known as "law No. 10." We now continue the subject, and present section 11 of the code as the next point for comment. It is as follows:

11. He (the bowler) may require the striker at the wicket from which he is bowling to stand on that side of it which he may direct.

This rule refers to the power the bowler has of requiring the batsman to stand so as not to interfere with his, (the bowler's,) movements in delivering the ball, and in this respect the bowler has arbitrary power, as it is nothing but right that he should have a clear path for his movements in delivery. Next comes the reference to wide bowling, and here we have a very badly worded section, and one which does not cover the whole point of the play. The rule is as follows:

12. If the bowler shall toss the ball over the striker's head, or bowl it so wide that in the opinion of the umpire it shall not be fairly within the reach of the batsman, he shall adjudge one run to the party receiving the innings, either with or without an appeal, which shall be put down to the score of wide balls; such ball shall not be reckoned as one of the four balls; but if the batsman shall by any means bring himself within the reach of the ball, a run shall not be adjudged.

This rule as worded fails to cover certain important points. For instance, it fails to define whether the ball is wide that simply passes over the batsman's head, while he stoops to avoid a high ball hitting him, or whether it is wide only when it goes over his head while standing upright. Again, in calling a wide no provision is made for the point of play when a ball called wide by the umpire is hit by the batsman. The real definition of the rule as governed by custom is as follows: The ball is only wide when bowled over the batsman's head, when it goes over his head out of fair reach of the bat, as the batsman can readily allow a high pitched ball which goes over his head and yet not out of the reach of his bat, to strike his bat and glide off to "leg" in such a way as to secure a short run by it, and in such case no wide ought to be called. The object of the rule is simply to punish the bowler for delivering the ball out of the legitimate reach of the bat, and therefore it is left to the um-

pire to judge whether the line of the ball is covered by the bat; if it is no wide is called. Thus, in the case of the batsman who stands well in his ground and never steps out in endeavoring to reach a ball bowled off the wicket, the umpire is justified in calling a wide on a ball nearer the wicket than on one sent in off the wicket to a tall batsman who is free in his hitting and apt to reach well out in "cutting to the off." In reference to the hitting of a ball which the umpire has called wide, there is no questioning the fact that such a ball should be decided a fair hit, and the decision of wide reversed. But no such mistake would ever be made if the umpire would refrain from calling wide until the ball has passed the wicket, and this the rule should require him to do. No matter how wide of the wicket the ball may be delivered, if the batsman choose to step out to hit it, and either does so or covers the line of the ball with his bat, no wide can legitimately be called. A mistake of this kind was made by the late Mr. Sharp, when acting as umpire in one of the international matches in Philadelphia, in 1858. He called wide ball on a ball which the batsman hit, and the ball was caught on the fly. The umpire ought to have reversed his decision, and given the batsman out, for his decision was erroneous, as the ball was not bowled wide in the meaning of the rules, as the fact of its being hit proved, the umpire being too hasty in deciding it wide before it had passed the wicket. In this case the English cricketers decided that the umpire's decision ended the matter; in this they erred according to the wording of their own rule. The spirit of the rule is that every ball is wide if bowled out of the legitimate reach of the bat, and that legitimate reach varies with the style of play of the batsman, and whether he is tall or short, or in the habit of standing close in his ground or not. Of course, a correctly worded rule should cover all these points, which the rule in question does not.

—The Peninsular Cricket Club of Detroit, held their annual meeting on March 9th. The club financially is evidently in a satisfactory condition. They played seven matches last year, four of which were won and three lost by the Club. The following were elected officers for the year:—

President, R. B. Ridgely; Vice President, Fred. Bamford; Treasurer, J. W. Waterman; Secretary, A. Borrowman; Committee of Arrangements, Underwood Armstrong, Frank Irvine, Charles B. Calvert, W. F. Kelso, Frank Gidday.

—The New York Athletic Club held their annual meeting last week at their rooms, Nos. 4 and 6 East Twenty-eighth street, when the following officers were elected for the ensuing year:—President, D. H. Knowlton; Vice President, Richard C. Fellows; Secretary, William E. Sinclair; Treasurer, M. Elliott Burris; Captain, H. E. Buermeyer; First Lieutenant, R. William Rathbone; Second Lieutenant, Waldo Sprague; Trustees, J. N. Miller, George Moore Smith, W. K. Collins; Delegates to Harlem Rowing Association, H. G. Meeker, P. A. Curtis, N. E. Buermeyer; Delegates to Athletic Convention, N. G. Meeker, M. Elliott Burris.

BASE BALL IN ENGLAND.—The subject of American base ball has suddenly become as interesting a topic among the class of English sportsmen who favor field games as cricket was to us during the advent of the English cricketers in America in 1858. The mission of the American agent of the base ball tourists has been a decided success, and, from the comments of the English sporting papers, it is very evident that the representatives of our national game will meet with a hearty reception next August. The *Land and Water*, in reference to the visit, says:—

"It is now almost certain that the contemplated visit of a party of base ball players from America will be an accomplished fact. Mr. A. G. Spalding, their representative now in London, has received such flattering assurances of success here from well qualified persons that we may confidently look forward to the appearance of the Americans at the end of July next. We understand that in all probability Meade and Newhall, two good bowlers—and perhaps the best in the United States—will accompany the excursion, so that we may count on an excellent show of cricket as well as at their own national game. The Marleybone Club has, as usual, been foremost to encourage and assist the project, for it has, through its secretary, offered the free use of its ground for three days to the strangers on their arrival. Moreover, our English Amateurs were so hospitably entertained last year, during their stay in America, that it becomes us to give their entertainers a hearty and warm reception on the occasion of this return visit."

On the 27th of February last a game of base ball was played at Kensington Oval between nines respectively captained by Mr. Spalding, of the Boston Club, and Mr. Chas. Alcott, of the London *Sportsman*, the latter of whom made his *debut* as a base ball pitcher on the occasion. He was assisted by Mr. Briggs, of the Beacon Club, of Boston, who ably acted as catcher, and, being well supported in the field, Mr. Alcock's side came in the victors by the following score:—

Spalding's side—1 1 0 1 0 2—5.
Alcock's side—2 2 1 4 0 8—17.
Mr. Spalding visited Paris before he left, and inoculated the Parisians with the base ball fever.

—By the report of the proceedings of the Professional Association Convention held in Boston, it will be seen that the ten men rule though excluded from championship contests is to be the rule for all exhibition games played by the professional clubs. In fact they are debarred playing any "exhibition," game under the regular rule of play until they have played their championship series to a close. The first series of these games therefore under the ten men rule will be played the same week, in April, when the Bos-

ton Club will make an exhibition tour prior to their commencing the championship series. As at the Amateur Convention in New York last December, some of the delegates declared that the basis of their opposition to the ten men rule was the fact that the Professional Convention would adopt it, and that they wanted something different to the game that class played, by the same course of reasoning the Amateurs should adopt the new game themselves. Under their proposed rule of allowing but a square pitch in delivery, they well want ten men in the field to keep down the large scores that will be made against a simple pitch of the ball to the bat.

—A match game of billiards was played at New Orleans, March 14, between A. P. Rudolphe and George T. Slosson. Rudolphe won by a score of 400 to 227. His average was 31 and his best run 81. Slosson made a run of 106.

Rudolphe announces his readiness to play any man in America at 400, 500 or 600 points, French carrom, for any amount, from \$1,000 to \$5,600 a side.

—The Billiard Tournament at Bumstead Hall, Boston, terminated on Friday last. The players were Garnier, C. Dion, J. Dion, Ubassy, and Daly. The following table shows the result of the ten regular games of the tournament:—

	Games Won.	Games Lost.	Best Runs.	Average.	General Average.
Garnier....	3	1	78	7.48	5 $\frac{1}{2}$
C. Dion....	3	1	77	6	5 1-6
J. Dion....	2	2	45	5.80	4 $\frac{1}{2}$
Ubassy....	1	3	65	7.11	5 1-5
Daly.....	1	3	43	5.89	4 1-7.

This placed the first prize between Garnier and Cyrille Dion. The third prize belonged to Joseph Dion, and the fourth lay between Ubassy and Daly.

The tie between Daly and Ubassy for the fourth and fifth prizes was played on Friday evening last, and resulted in Ubassy winning, making the 400 points to Daly's 324. Cyrille Dion and Garnier settled their tie, and the last game of the Tournament Mr. Allen umpired for Dion, Mr. Gallagher for Farnier, and Mr. Pulsifer was referee. Garnier at once took the lead with a run of 18, and soon after this he piled up 40, which, followed by 22 and 19, carried him round his first corner, with Dion at only 28. Dion was playing very poorly, and this continued to do to the end of the game, his runs, with the exception of a 35 and a 41, being unworthy of mention. Garnier won on the sixty-seventh innings, making the necessary 400 points to Dion's 241. The final result of this well managed Billiard Tournament is as follows:—

Garnier besides making the largest single run, the best single game average, and the best average of the Tournament, takes the first prize \$600, and the gold badge. C. Dion the second, \$400; Joseph Dion the third, \$100; Ubassy the fourth, \$250, and Daly the fifth, \$150.

New Publications.

THE AMERICAN SPORTSMAN. By Elisha J. Lewis, M. D. With illustrations. Third edition. Philadelphia: J. B. Lippincott & Co.

It may be safely said of this excellent book, the work of a thorough sportsman and naturalist, that, like good wine, it simply improves with age. Familiar as the "American Sportsman" may be to many of our readers, who some eighteen years ago first turned over its leaves for information, it is pleasant to see that our youngsters, those inclined to handle the old muzzle-loader which once belonged to their sires, still look up to Dr. Lewis' book for not only amusement, but instruction. Books of this character, so excellent in style, so thorough in their acquaintance with the topics they treat about, are always fresh. The arms may have been revolutionized, the localities may be less thronged by the birds, the grounds where Dr. Lewis and the reviewer might have had a pleasant day's shooting some fifteen years ago, may now be covered over with bricks and mortar, but the habits of the birds, their varieties remain forever the same. The most flattering compliment that can be paid to the "American Sportsman" is to state that it is now in its third edition, for no similar American book treating of the game birds and wild fowls of America, or the training of dogs, has ever been so increasingly popular or more frequently quoted as authority. It belongs, perhaps, not only to the grace with which this volume is written, apart from the varied character of its contents and its reliability, but from the fact of an inherent veneration all true sportsmen have for books which treat of the topics so dear to them, that a compilation like the "American Sportsman" never does grow old. We may have, in time to come, other books given to us on this same inexhaustible subject, for there is a change in all mundane matters, and perhaps in twenty years to come the breech-loader of to-day may be as antiquated as is the muzzle loader; but Dr. Lewis' "American Sportsman" must always remain as the foundation on which other works will have to be built, and to its worthy author and to Philadelphia must be accredited the praise that the volume under review was the first thorough book of the character ever produced in the United States, not even excepting Frank Forrester's "Field Sports."

THE HEROISM OF MARY DUSTIN, and the Indian Wars of New England. By Robert B. Covesly. Boston: B. B. Russell.

This, from what we learn from the advanced sheets, will be a most interesting and vigorous narration of the heroism of Mary Dustin, who was taken prisoner by the Indians, with her infant one year old, and Mary Neff her nurse. This event occurred on the fifteenth of March, 1698 at Haverhill, Mass. Mrs. Dustin was taken from her bed and compelled to follow her captors, who, tired of the child as an incumbrance, killed it and left it on their trail. The party proceeded up the Merrimack River with the mother and nurse, and encamped upon a picturesque island, which is now known as Dustin's Island. Here they landed and built a fire and sought a temporary rest, previous to proceeding to the Indian settlement. Well knowing the wretched fate reserved for her, Mrs. Dustin resolved to escape from her enemies, and imparted her plan to her nurse and a lad named Leonardson, a previous capture. When the Indians, worn out with their orgies, lay in profound slumber, this intrepid woman, with the aid of Mary Neff and Leonardson, actually killed ten of the savages and made their escape in the canoe of the Indians and arrived in safety at the settlements. In commemoration of this event the Dustin monument is to be dedicated on the coming 17th of June, with appropriate ceremonies.

In the forthcoming book a full account of this early and thrilling history will be found.

MICROSCOPIC OBJECTS. The preparation and mounting of Microscopic Objects. By Thomas Baires. 12mo. Cloth, \$1 25. N. Y.: G. P. Putnam's Sons.

FOREST AND STREAM PRIZE LIST.

The Publishers of FOREST AND STREAM

THE SOUTH.

THE SOUTH occupies a distinctive field in journalism. It is the only newspaper in the country, devoted exclusively to the material development of the Southern States. It is a reliable medium through which the people of the North, and of foreign lands, may gain correct and valuable information of the boundless resources of the South, and a just estimate of its people.

A series of special illustrated issues of *The South* has been begun, in which it is proposed to treat of each of the Southern States in turn. These issues will be made up of articles treating of railroads and commerce, manufactures and agriculture, soils, minerals, climate and products, history and literature. These papers will be made the most comprehensive and valuable contributions to the leading subjects in question yet published.

The South is a handsome, large, weekly journal of eight pages, printed on fine white paper, and mailed at \$3 a year, in advance. Single copies 10 cents.

Address,

THE SOUTH PUBLISHING COMPANY,

Bennett Building—Ann, Fulton & Nassau sts. N. Y.
Forest and Stream and The South will be furnished for one year for \$5 50.

27

A History of North American Birds.

MESSRS. LITTLE, BROWN & CO.,

110 Washington street, Boston,

Have the pleasure of announcing to the public an entirely original work upon the BIRDS OF NORTH AMERICA, prepared by Prof. Spencer F. Baird, Assistant Secretary of the Smithsonian Institution, with the co-operation of Dr. Thomas M. Brewer and Mr. Robert Ridgway.

The LAND BIRDS, complete in 3 vols., small 4to, illustrated by 593 woodcuts, and 64 plates of full life-size illustrations of the Heads of the species. Vols. I II, LAND BIRDS now ready; Vol. III ready in March. Price \$10 per Vol.; colored by hand, \$20. Volume IV, on the WATER BIRDS, is in an advanced state of preparation, and will, it is expected, be ready early in 1875.

Delivered free to any part of the United States on receipt of the price.

The authors have been permitted access to the unrivalled collections of the Smithsonian Institution, which embrace everything necessary to the preparation of a complete account of the Birds of North America, in the immense number of skins, as also of nests and eggs, brought from every locality, and properly classified and arranged, and in most cases accompanied by detailed notices of their history.

The object of the present work is to give a complete account of the birds of the whole of North America, north of Mexico, arranged according to the most approved system of modern classification; and with descriptions, which, while embodying whatever is necessary to the proper definition of the species and their varieties, in as simple a language as possible, exclude all unnecessary technicalities and irrelevant matter. On this account it is especially recommended to the beginner. The descriptions are all prefaced by analytical and synoptical tables intended to diminish as much as possible the labor of identification.

The illustrations consist, first, of a series of outlines exhibiting the peculiarities of the wing, tail, bill, and feet of each genus; but as these diagrams, however serviceable to the ornithologist, necessarily fail to give any idea of the form of the bird, they are supplemented by a second series, including a full-length figure of one species of each genus. In addition to the above, a series of plates is furnished, containing one or more figures of the head, in most cases of life-size, of every species of North American bird, including the different sexes, ages, and seasons, where these are necessary for the proper illustration of the subject.

The Publishers feel justified in saying that the typographical execution of the work, and the accuracy and beauty of its illustrations, surpass anything of the kind ever published in America.

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

SIR:—A friend of mine sent me, with a transport of Indian Skins, two pounds "Vanity Fair," which I declare to be the best Tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair" is the King of all, by its aromatic flavor and the right sort of strength. My friend in New York got an appointment in California, by that reason I apply immediately to you, begging you to send me for the enclosed ten dollars, a supply of "Vanity Fair," and send with the next steamer to Germany. If there is a German firm that sells your excellent "Vanity Fair," I beg you to enclose me the address.

BREECH LOADING GUNS
A SPECIALTY.

We would call the attention of the public to our large assortment of

Breech-Loading Shot Guns,
Manufactured by the following celebrated makers:
Messrs. W. & C. SCOTT & SONS (winners at the International Gun Trial of 1873); P. WEBLEY & SON,
W. W. GREENER, WESTLEY RICHARDS, J. HOL-
LIS & SONS, and other makers.

A full line of fine
PISTOLS AND RIFLES CONSTANTLY ON HAND.
DIXONS & HAWKSLEY'S SHOOTING TACKLE.
To insure good shooting from Breech-loading Guns,
we would recommend the use of the

STURTEVANT BRASS SHOT SHELLS,
manufactured by the Union Metallic Cartridge Co.,
Bridgeport, Conn. These shells are the cheapest and
best in the market, can be easily re-capped with ordi-
nary caps, without the use of the implements neces-
sary in priming all other styles of shells.
BUSSEY'S PATENT GYRO PIGEON AND TRAP,
WITH CASE, AND 100 BIRDS.

**DR. FOWLER'S PATENT
HARD RUBBER REEL.**
"The Gem."

Imperishable, Light as a Feather, and
not Liable to Get Out of Order.

Numerous letters of recommendation have been re-
ceived from the most experienced anglers in America,
highly approving of this Reel, prominent among
which are Mr. Seth Green and the Hon. Robt. Roose-
velt.

This Reel, the latest contribution to the angler's
outfit, has now been before the public for one year,
and we have yet to hear of the first complaint from the
many hundreds who have used it.

ANDREW CLERK & CO.,
Sole Agents for the United States,
25-61 48 MAIDEN LANE, NEW YORK.

Sportsmen's Goods.

This rifle was submitted in competition with over
one hundred different systems, American and Euro-
pean, to the Board of United States Officers, appoint-
ed by Act of Congress, 6th June, 1872, for the pur-
pose of selecting the best arm for the service, and of
which Brig. Gen. A. H. Terry was President. It suc-
cessfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for
the military service by all nations is only a question
of time; that whenever an arm shall be devised which
shall be as effective as a single breech-loader, as the
best of the existing breech-loading arms, and shall at
the same time possess a safe and easily manipulated
magazine, every consideration of public policy will re-
quire its adoption.

Resolved, Further, That the experiments before the
Board with the Ward-Burton Magazine System have
so impressed the Board with the merits of this gun,
that they consider it as more nearly fulfilling the con-
ditions above specified than any other tried by them
or of which they have any knowledge, and it does
recommend that a number of magazine muskets be
made on the plan for further trial in the field." (See
Ordinance Report.)

We are now making these guns to supply the nu-
merous demands, and will soon have them in the
market.

The following is our scale of prices: Special Maga-
zine for large game, carrying from 3 to 8 cartridges,
70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10
lbs. weight, from \$60 and upwards, according to finish.
Special Long-range Magazine Rifle for Creedmoor
shooting, 90 grs. of powder, 480 grs. of lead, carrying
3 to 8 cartridges, weighing 10 lbs., from \$100 and up-
ward. Magazine guns for general use, carrying 3 to
9 cartridges, 60 grs. powder, 350 grs. lead from \$40
and upward. Single Breech-Loader, Creedmoor
shooting, for long range, 90 grs. powder, 480 grs. lead,
from \$60 and upward. Single Breech-Loader for
general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead,
from \$30 and upward. The calibre of all our rifles,
unless otherwise ordered, will be .45-100. in.

For Forest and Stream.

WINTER SCENES.

SLOW sinks the royal sun behind the woods,
The desert woods of winter; the red flush
That blooms along the cloud-land of the skies,
Tinting its vapory world with hues of rose,
Streams thro' the naked groves, and gilds their tops
With lights the woods receive in Autumn time.
Tall chestnut trees that crown the upland slopes
Nod their brown branches in the ruddy light;
And yellow willows by the frozen stream,
And alders black that skirt the oozy swamp,
And the lithe, silver poplars, slim and tall,
Touch'd by the slanting beam, with beauty glow.

Deep lie the snows in many a drifted heap,
On turfy mounds beneath the lifeless woods,
Whose rugged bolles are white with downy flakes,
Or crusted thick with adamant ice,
That like a burnish'd armor clasps them round.
Each leafless sprig and slender spray is gemm'd
With jewels crystalline, that shift and shine
And tinkle as the sorrowing breeze goes by.
'Tis like some grotto in enchanted land,
Where tricky elves and fairies hold their sports,
And in their frolic merriment adorn
The haunted precinct with gay jewelry,
Twining their wreaths of pearl and amethyst,
Their diamond garlands to bedeck the haunt.

Mute lies the shining river in its bed,
And mute the glistening lake outspreads its space;
The foaming waterfall of summer time,
That down the mossy rocks its torrents pour'd,
Freshening the bending ferns and rosy blooms,
Now grim in icy death lies motionless.
The blithe cascade that turn'd the miller's wheel,
And with its churning foam made endless noise,
Fix'd by the frost's enchantment pours no more.

The white untrampled fields immense extend
Their crusted slopes to th' horizon's verge,
Trod by no cropping herd or browsing flock,
And lifeless all, save when the woodman's sled
Laden with forest boughs, plows thro' the waste;
The piping quail no longer skims its space,
Nor the brown partridge seeks its stubble fields,
Nor comes the limping hare or prowling fox;
They all have vanish'd to deep woods of pine,
Or where the hemlock groves their shelter yield;
No flap of wing, save flight of cawing crow,
Or where the hawk in airy circle swings.
Far down the country road, with hedges lin'd,
The farmer opes the way with cumbersome sledge,
And there the merry sleighs with jingling bells
And prancing team and ringing laughter peals,
Cheer with their jocund life the barren scene.
Though shapeless drifts besiege the farm-house door,
And high on roof and gable lies the snow,
Yet mirthful faces beam around the hearth,
And gleeful sports prolong the winter night,
With viol's tinkle and the dancer's tread.

Far up the drear Canadian forest grounds,
Where pines like giant lances rise in air,
And sombre hemlocks spread their slanting boughs
Laden with snows and bright with glittering ice,
The hunters and the trappers seek the woods,
Sliding on cumbersome snow-shoes o'er the drifts,
And dragging as they go the Indian sledge.
For days they trample o'er the crusted wastes,
Cheering the way with tales of forest life,
Or songs of war, or chase, or Gallic chants.
Each bears the heavy rifle in his hand,
And shining knife and hatchet in his belt,
And though the Russian breeze assaults their route,
They heed it not, each wrapt in furry robe,
Or buckskin dress, or Indian blanket white.

And when the shades wide o'er the landscape creep
The halt is made, the weighty guns are stack'd,
Or hung on branching pine; the goods are pil'd,
The snow is scrap'd and heap'd in windward bank,
A tree is felled, and high a roaring fire
Shoots up its fork'd flame and dusky smokes;
Then come the feast, the song, the soothing pipe;
Then each repose on tiny cedar conch,
Sleeps till the morning dawn peeps o'er the groves.

And when the moose yard with its trampled snows
Is found, how thrillingly intense the joy!
The light toboggans are unharness'd quick,
Packs cast aside, the clogging snow-shoes loos'd,
And each one creeping o'er the level snows,
Or gliding thro' the thick-set cedar copse
Reaches the spot that fair commands the "yard,"
And then how wild and wonderful the scene!

The big bull moose within the rifle range
Flaps the huge ears and paws with cloven feet,
Unconscious all of danger, while the cows
Browse on the spicy firs or chew the cud.
Then sudden uproar and tumultuous din
Wakes the sleeping woods and tranquil scene!
When rifles crack and frequent flashes gleam—
What bellowing, savage ones, and piteous groans!
Some stretch'd in death encrimson all the snows;
Some wounded, wallowing struggle in the drifts,
And some unharm'd break frantic into flight,
While pitiless the hunters hem them round. ISAAC McCLELLAN.

For Forest and Stream.

Formosa—The Beautiful.

NUMBER THREE.

[Continued from March 26th.]

HISTORY gives to the Chinese the credit of the discovery of this island nearly four and a half centuries ago, but either the Chinese must have been very modest in their claims, or those inhabiting the coast previous to A. D. 1430 were very short sighted, for on a clear day the bold outlines of the great range of mountains, which, like a huge back bone, extends the length of the island, is distinctly visible from the China coast, and to the fisherman, venturing a day's sail from home in his well-formed boat, Mount Morrison, 12,800 feet in height, with snow-clad peak, must have been a familiar object. It is far more likely that, ante-dating authentic records, many Chinese seamen have been driven to make harbor on its coasts, and, absorbed into the various tribes of aborigines, have helped give origin to the complex variety of natives peculiar to Formosa, and which puzzle the ethnologist to account for.

The island is some two hundred miles in length, lying in a N.N.E. and S.S.W. direction, its northern end being in latitude twenty-six degrees north, and its southern stretching down into the tropical region of twenty-two degrees. At its widest part it is seventy miles in breadth. Three ranges of mountains run nearly parallel lengthwise of the island, with rich and fruitful valleys between, the eastern range marking the coast line, which is bold and precipitous. The Chinese name for the island is Tai-wan, or "Great Bay," a name singularly inappropriate, as there is no bay worthy of the name on its coast. More just is the title given it by the Portuguese, who, approaching from the eastward, or from the muddy rice flats and barren hills about Macao and southern climes generally, enchanted with the thickly wooded mountains and the bright streams of of clear water, pouring like silver ribbons over the faces of the cliffs into the sea, christened it "The Beautiful." Among the mountains, and formerly on the plains are, and were, found tribes of natives differing widely in physique, customs, and languages. This is undoubtedly due to the peculiar situation of the island, a central point, over which the fierce winds of the northeast monsoon sweep unchecked, and drift to its shores unlucky fishermen from the north, and in summer months the resistless typhoon has hurled in the same direction those from the south, and with the strong current of the Kuro-siwo sweeping along its coasts all attempts to return have been frustrated, and thus the Japanese and Kurile islanders, and those from the Bashees and Philippines, and Malaysians from still farther south, have contributed their quotas, and years of inter-marriage have softened down but not obliterated the distinctive traits of the races. But little is known in regard to the greater portion of the Hillmen. Vague stories of cannibals, and in all respects fiendish savages, dwelling among the mountains, one hears from the Chinese, but such explorations as have been made have redeemed from such bad repute the mountaineers encountered. Wild men they are, and to the Chinese relentless foes, but they are brave, not without chivalry, have certain arts and manufactures, and live in comfortable villages. Among the mountains on the southern end of the island dwell a confederation of eighteen tribes, each with its chief, but all governed by one supreme ruler—Tank-e-tok.

One of these tribes—the Koaluts—fell upon the ship-

wrecked crew of the American bark Rover and murdered them. General Le Gendre, the United States consul at Amoy, China, resolved to seek the savages to recover the remains of the murdered people, and to endeavor to make such understanding with the natives that in future the only harbor at the south of the island might prove a place of refuge rather than a trap to death of unfortunate mariners lost upon the outlying dangers. Making use of his great influence with the Chinese, who thoroughly believed in him, and had given him a name signifying "he who will not lie," Le Gendre addressed a despatch to the Viceroy of Foo-kien and showed him that, as the Chinese claimed control of the island, they were responsible for the doings of its inhabitants; that the aborigines stood to the Chinese in the same relation as do our Indian tribes to the United States, and that we insist that foreign nations should consider those tribes as existing at our will; and finally, that if the Chinese disclaimed the responsibility they could bring no valid objection to any other nation taking possession of the land, for by their own doctrines civilized nations have right to substitute their own civilization for that of an inferior one. Le Gendre's arguments convinced the Viceroy, who placed under his command a large force of men and a steamer of war. Thus equipped the general started on his campaign, and in a few weeks had accomplished his object, losing during the time one-eighth of his force from hardship and disease. Among the "Sabarees" he met Tauketoh, the chief ruler, and effected with him a treaty, which has never been broken. A portion of the conversation between them, as told me by the general, was of interest.

"Do you come in war or peace?" said the chief. "In peace, I hope." "Then I will talk with you; what do you wish?" The general briefly called upon him for information in regard to the massacre of the Rover's crew.

"It was not done by my tribe (he is individually a Sabaree), but by the Koaluts."

"Why did they do it?"

"Because of a vow. Many years ago white men came among them from a ship, robbed them, outraged their women, and in the ensuing fight killed nearly all of the tribe. The few left swore upon the graves of their ancestors, and of their murdered friends, that forever after no white man falling into their hands should escape with life."

"But why did you kill Mrs. Hunt; she was a woman, not a man?"

"We did not know it; she was dressed the same as the rest, in men's clothes; they were sitting on the beach eating, and were killed by one volley of musketry, fired from the bushes. Afterwards, in stripping the bodies, we discovered that one was a woman, and we were grieved."

Le Gendre then, by acts of his own, succeeded in producing a friendship in this untutored savage, and finally asked him direct if that vow could not be retracted. Tan-ke-toh replied that by certain ceremonies it could, and said:—

"We did not know the noble hearts of the white men, but we do now. In the battle (referring to the attack made upon them by the Hartford's crew) such courage was never seen. They came into the mouths of our guns, and the brave leader who was killed seemed to seek death. We would like to be friends with so great hearted a people."

A simple religious ceremony, the particulars of which I cannot remember, was gone through with, and, on behalf of the eighteen tribes, their ruler recanted the old vow and took a new one, to always befriend the whites. The chief promised that the remains of Mrs. Hunt should be restored, and this promise was kept. The "Sabarees" are the most powerful of the eighteen tribes. I have not seen them. Le Gendre describes them as fine looking, robust men, darker than the Chinese, and without the almond-shaped, oblique eye which characterizes the Mongolian. They are probably of Malay origin. They subsist by hunting in a great measure, but also by agriculture, the women cultivating large crops of millet and other grains, and tobacco. In their field labors the women have the assistance

of a remnant of a race of men whom the general found among them. These people, called the "Amias," seem to occupy a position of serfdom to the Sabarees; they are of a lighter complexion, milder disposition, and speak among themselves a different language from their masters. They are probably descendants, if not the originals, of captives of war from some tribe living farther to the northward. These "Amias" are not allowed to participate in the annual hunt, nor to bear arms; they are called upon to assist the women in tilling the soil, and in every way are treated with indignities, yet with no positive unkindness, and that they are not of the fiery Malay blood is evident from their contentment with their lot.

The general had his interview, made his treaty, and returned to his consulate at Amoy, but certain home stayers, "fireside warriors," criticized severely his results. The British said, and I have heard them:—"It's all bloody fine, you know, but it's all rot; the beggars will do as they always have, and the best way to fix them is to kill the lot of them."

Her "Britanic Majesty's consul" at Foo-chow said the same thing in official despatches, although his language was a little more choice. He wrote to his government an official despatch that an agreement binding upon one tribe was not binding upon others; that eastways upon the island would be slain as of old, and that therefore the work of pacification was an endless one, and that Le Gendre, "instead of being carried away by his dreams, should have, with the means at his disposal, punished severely the recreant tribes, and that war alone was the panacea for the evils that had existed; annihilation their only cure. The savages would not keep their promises. Let Le Gendre try it on once and he'll find a rough time of it, etc."

The general, in his official despatches, states that he heard of such criticisms. I state that I heard at many a dinner the criticisms. Irritated by these ungenerous views the general resolved to put his handiwork to the test. To use his own official language, "Sixteen months having elapsed without any casualty occurring that would test the efficacy of my work, I determined to force events. Placing myself with trustworthy persons in the defenseless condition in which we find eastways generally, I proposed to go across the territory of the aborigines, from coast to coast, meet them, and return to the starting point guided by their own people."

In short, the general, Mr. Man, the commissioner of customs at Amoy, and Mr. Pickering, a Dutchman who had lived among the hills, and who, having, it is said, married a native girl, was proficient in the language, for interpreter, started from Sakao in a native boat for a cruise among the savages. With no arms, and no escort but their small retinue of cowardly servants, they were indeed helpless if the general's treaties were failures. They sailed down the coast to Liang-kian, the nearest seaport to the home of the Sabarees, and pitched their tent in a public square for the night.

Liang-kian is inhabited by a race of mixed blood, originally Chinese. Wives from the half castes living on the foot hills have been brought in, and the villagers have at this date as many of the traits of the mountaineers as of the Chinese. They received the party with hospitality, as well they might, for the general was well known to them, and possibly enrolled among the list of their deities. A year before he had been with them, and I was with him, and with us was Tom Dunn, our genial consul at Foo chow, than whom a keener shot or more enthusiastic naturalist even the *FOREST AND STREAM* does not rate among its readers. We encountered a party of mountaineers of the "Boonting" tribe, who had come in to barter their game and skins for cloth and guns. Never losing an opportunity for carrying out his mission, which he considered the development of Formosa, the general arranged for a consultation on business with the chiefs of this tribe, and during the afternoon said interview occurred, seated in the open air and surrounded with a dirty rabble of villagers, who were friendly but annoying through their great inquisitiveness, which prompted them to too close investigation of our person and apparel, a degree of propinquity which the animated condition of their heads rendered highly undesirable. The Hillmen, more shy and suspicious, stood warily near, with their spears and muskets in hand. The chiefs were swarthy, truculent looking fellows, with high cheek bones, and little narrow, sharp black eyes. Their wardrobe was limited to the simplest form, consisting of but a breech cloth and turban. Some native wine having been sent for by the headman of the village, diplomacy began, and while the general impressed the savages with his ideas Dunn and I amused ourselves with their peculiarities, and puzzled ourselves in a vain search for even a trace of beauty in the faces of the motley crowd of males and females who encompassed us. We gradually became aware that there was an interruption to the harmony of the proceedings; a dozen of the lesser savages joined with their chiefs in an emphatic negative to some proposition of the general's, and an excited conversation among themselves, and black looks at us, made it evident that our comfort at least was the better secured by the presence of the little gunboat in the harbor. They had a keen remembrance of the effect of shells thrown from similar vessels during the attack upon them when, in avenging the murder of the Rover's crew, the gallant McKenzie fell face to the foe. The general deliberated; sitting with his elbow on his knee and his face partially covered by his hand. His thoughtful, unexcited attitude soon calmed the storm, and in curiosity as to his next move every eye was centred upon him.

Dunn and I felt uneasy. A failure upon the part of the

general was an event never taken into our calculations. Presently he removed his hand from his face and arose. A shout from five hundred savage throats caused us to start and look to our revolvers; but there was no need. The shout betokened astonishment, for there stood the white man, and wonderful to tell, his eye was gone! A moment ago he had been as other men, yet without sign of pain or struggle he had plucked his eye from its socket. Hardly had they fully realized the wonderful change, when with a weary gesture the general wiped his brow, and lo! his eye had been replaced, and there was no longer a blemish.

That confederate bullet, that had forced the hero to invoke the assistance of art to restore the seeming of Nature, had worked a triumph for the United States unparalleled in the annals of diplomacy. I have the authority of a late assistant Secretary of State, to whom I related this anecdote, that no stroke of diplomacy had ever been effected in the same manner. From that moment the general was looked upon as a supernatural being, and every point demanded was conceded without remonstrance, and, as did old Tankitok for the Sabarees, these chiefs pledged themselves and tribe to assist and shelter and to escort, unharmed, to the Chinese village any mariners that future gales might cast upon their shores.

The amount of reverence exhibited toward the general during the balance of our stay was overwhelming. Dunn and I did not fare so well. Several of the savages had by signs entreated us to also take out our eyes, and as circumstances compelled us to refuse this modest request we lost prestige, and were compelled to drink, each of us, our "samshu" from an individual bowl, while the general was honored by the head chief with a ceremony which was pleasing to look at—with his arm around the general's neck, and requiring of him the same, a bowl of samshu was brought to their nearly united lips, and when the old fellow had made a solemn but incomprehensible speech, the general's face not indicating joy at this unpleasant form of toasting, they drank simultaneously, and thus pledged themselves to everlasting friendship. Dunn remained a comparative nobody until the end of our visit. I recovered slightly the lost ground by means of several successive shots, which I fired at nothing in particular, without seeming to reload my gun; they had never seen a breech loader.

The visit I have just described paved the way for the general on this second adventure. The people recognized and again wondered at him; and the memory of gay peacock feathers, gorgeous red flannel dilapidated cocked hats, and other valuables which had on that occasion rewarded the confidence shown by those of the savages who had ventured on board the gunboat—leaving me for a hostage—caused full respect for the dispenser of so much riches.

PISCO.

(To be concluded in our next.)

LEAVES FROM A SURVEYOR'S JOURNAL.

LOST IN THE WOODS.

WE were a party of twenty-two, including the two teamsters, on the preliminary survey of the northern division of the Milwaukee and La Crosse Railroad, a proposed line at that time from Portage City to St. Paul, or rather to Hudson, just opposite on the Mississippi, in the spring of 1856. It was my first experience in the woods, and dearly I came near paying for the same.

We were a jolly lot and had some good times, mingled with not a little severe labor and a few hazardous episodes. We left Portage City early in April, and for three months went through the various vicissitudes of an out and out camp life.

We had penetrated into the Black river region, and for several days the pigeons had crossed and recrossed our line in countless numbers. In the morning the immense flocks as they came from the west consisted of the redbreasts or males; they returned toward noon, and their places were taken by their mates. We knew by these movements that there must be a nesting not far from us to the left. About two P. M. one day, having obtained permission of the boss, and the loan of the company's double barrel, I started to find the nesting with high hopes of an abundance of the delicious squabs. I pointed directly towards the sun, for that was the direction from which they were coming and going. In a couple of hours or less I reached the place, and what a scene was there; for miles and miles the trees were filled with the nests, some breaking down with the weight of their newborn oleaginous occupants, while the sky was obscured with the hurrying birds, and the fanning of the millions of wings made a noise like the roar of Niagara. I easily secured what I could conveniently carry of the butter balls and set out on my return. As our line, when I left, was pointing north, I thought all I had to do was to put the sun directly at my back and go ahead, and I could easily strike it, and then follow up to camp, and the next day a party of us would come back and get several bags of the young birds. But in my calculation I had forgotten two things, and very important items they proved to be. First, that but a short time previous to my starting out we had made quite an angle in our line, (which by the way merely consisted of a series of blazes on the trees with the brush trimmed out sufficiently for a distinct compass view, our teams had gone another way.) Before that we had been running west or northwest rather, and I had not thought of the sun's moving more or less northward as he sank to rest. Consequently by keeping him directly at my back I must have struck further south from where I started and beyond the angle.

Well, I trudged along until I felt sure I had gone far enough, but no line was there, no blazes, no broken bushes or signs of that region's ever having been visited by the "genus homo." I thought I must have passed it in my haste; back I went a mile or more, then returned east again.

The sun went down, the full moon arose in all her glory. I walked until far into the night, when suddenly the thought came over me that I was lost, lost in that wilderness, a hundred miles from a human habitation, with the exception of our camp, and that might as well have been as far off, for I could not find it. Oh, the helpless, sickening sensation that came over me; a terrible feeling it is, utterly impossible to describe; how the thoughts of home, of father, of mother, of my boyhood friends came thronging on my mind. I believe I have an ordinary share of pluck; but for a few moments I wilted, dropped on a log and just gave right up, prostrated. The idea of dying away out there alone; it was awful. The more I tried to reason the matter the more confused I became and the worse I felt. It was about eleven o'clock; I had thrown away nearly all my game, it being too heavy to carry in my fagged out state. I finally rallied, reasoning that as I was not dead yet, I would have some supper, get some sleep, and perhaps something would turn up in the morning, for "hope springs exulting on triumphant wing." I was then in the midst of a heavy timber; I found a huge pine that had been torn up by the roots, leaving a space under the body of which I could crawl. I brought dead limbs and decayed logs until I made, as I thought, a secure bulwark on one side. On the other I built my fire from the dry tops of a dead hemlock but a few rods distant; for my supper I got away with a couple of the squabs, broiled on the coals without pepper or salt, and composed myself for a nap. I had not dropped to sleep, for the mosquitoes seemed more than usually voracious, when I was aroused by a gentle pattering on the leaves, and then a snuffing at my back; then the rotten logs began to move. Good Lord, it was a large animal of some kind; another danger to encounter. In my terror I yelled out with all my might. Then there was a scampering off until the sound was lost in the distance. Then I heard the gentle pattering in front but beyond the light of my burning twigs. Then I saw two balls of fire in the darkness, then two more; how terrible they looked; then they disappeared. After awhile I heard the noise at my back, the snuffing and the attempt to pull away my barrack. Again my voice tuned up, and the retreat was repeated. Again those fiery eyes in front; my fire was nearly out; it was several rods to the hemlock. To be sure I had a gun and a few charges of powder, I had fired off most of it in endeavoring to be heard at camp. But what kind of a show would I have had with a couple of full grown lynxes, (I presume that was what they were,) with pigeon shot? I sent a firebrand in their direction, and, as they again went off, with another in my hand, I reached my magazine—the hemlock—and having filled my arms, got back in a hurry to my fort.

This kind of fun lasted for an hour or two, until they seemed to have left, at least I had heard nothing of them for some time. I was pretty thoroughly played out, and I dropped to sleep in spite of my fears and the blood-sucking mosquitoes. I don't know how long I slept, when I was aroused by a sound so infernal, so demoniacal that cold chills struck through to my bones. I sprang from my bed of leaves, struck my head violently against the huge log or body of the tree above. The blow sent me back again to the ground. There was a tremendous ringing in my ears, the view of the multitudinous constellation may have been grand, but it was attended with exceedingly painful sensations. In my half awakened and confused state I thought I was dying; how the ten thousand thoughts rushed on my brain! In that moment it seemed that I recalled every act of my life, and saw all my friends, both the living and the dead, pass before me. I was fast losing consciousness, when I was brought back to existence and the reality by that horrible sound "hah, hah, h-a, a-h." I can liken it to nothing else than the hideous laugh of a demoniac darkey, but so wierd, so unearthly in its tones, my flesh crept and my hair rose on end. Again was that sound repeated. It seemed to come from the trees above, then was answered from below; then there was a rushing of wings and that laugh rung out in the stillness of that dismal wood. Then the snapping of bills that sounded to me like the gnashing of teeth of a monster in a rage. Good Lord, what could they be? My fire had burned down quite low. With my gun cocked and pointed outward I endeavored in vain to peer into the darkness. I replenished the fire with a few dry twigs and as it blazed up, again rang out that laugh, and there came a rush of wings, and so close that it fanned the dying embers, and a huge body with a rush went by. I saw only the shadow, but it seemed gigantic in proportions. A moment more and I saw it—the thing—on the ground, indistinctly, by the fitful glare of my smouldering fire, a hideous monster with horned head and scaly breast. As it gazed at me with those monstrous eyes of fire and gnashed its teeth with rage, in my terror I distinctly saw its cloven hoof. My feelings may be faintly imagined but can be by no possible means described. It was but momentary, though "the fiery eyes burned into my bosom's core." I rallied, my pluck came back, and I prepared to fight for what little life I had left. Just then the blaze caught in a pitchy knot, the light streamed up, and the thing stepped from a log to the ground. From a height of stature of six or eight feet, in a moment it dwindled to two, from a giant in size it became a pigmy in proportions. Those eyes lost their terrible fierceness, the scaly breast of mail, the split hoof, and the barbed tail were

gone, and the *Babo Virginianus** (Baird) or Laughing Owl of the North was before me.

Oh, the reaction of that moment! It was almost as painful as the previous terror. I was as weak as a child, and could have really cried with emotion. Ah, George! to have been brought up in the woods, and then to be so scared by an owl!

I dropped to sleep and rested undisturbed until the sun was well up. I traveled all day probably nearly in a circle looking for our line, (presume I was going back and forth parallel to it all the time,) until nearly dark, when I found a tree with the limbs so arranged that I could sleep with something of ease and safety. The day following, being the third out, during the forenoon I discovered what appeared to be an old blaze on a tree, but I had been so often deceived I hardly dared hope, but on looking on the other side there it was again; then I perceived one on another tree, then another. I had struck a section line; I followed it up to the corner. I was safe! Ah, how good those figures looked, the Town and range. I knew where I was then, eleven miles only from our line and about fourteen from the last camp. As we were moving only about six miles a day through the heavy timber I had an easy job before me. I lay down and slept an hour, then reached camp about four P. M. I had been given up by all hands. They had been back on the line, had built fires, fired guns and blown horns, but had finally bid good bye to George. But not soon shall I forget my first study from life of "laughing owls."

JACOBSTAFF.

*The great Horned Owl of North America has a great variety of cries peculiar to itself. Bonapart mentions the distinct utterance of the words "Waugh oh Waugh" as it rushes by, and other words in close imitation of the human voice.

For Forest and Stream.

A BULL FIGHT.

BULL fighting is still the popular amusement in Havana. These barbarous exhibitions are given at the *plaza de toros*, a large amphitheatre just outside the city. The centre of this building is occupied by an arena surrounded by a fence some six feet high, and strong screens placed at intervals, behind which the footmen find protection when hard pressed by the bull. From this arena tiers of seats, supported on arches, rise one above another to near the summit of the outer wall. The upper tier for nearly half the circle is fitted up into boxes arranged and furnished as at a theatre. As the combat begins at 4 P. M., the western wall opposes a barrier to the sun and divides the interior of the building into the *sombra*, (shady,) and the *sol*, (sunny,) the former being the fashionable quarter. The seats over the entrance to the arena are occupied by the musicians.

The exhibition I shall attempt briefly to describe was given a few weeks since in Havana for the benefit of the wounded soldiers, under the patronage of Captain General Jovellar's daughter, who with her father, and several members of his staff, occupied a conspicuous box, about which were seated a company of volunteers armed with muskets.

At 4 o'clock the bugle sounded, and two *picadors*, armed with long pikes, and mounted on blindfolded horses, and six *chulos*, or footmen, provided with colored cloaks, entered the arena as a triumphal procession, and bowing low to the fair patroness and the assembled multitude, took their several stations. After a moment's pause a gate near the main entrance was opened, and the bull ran wildly into the ring with a large rosette of fancy colored ribbons imbedded in his shoulder. To remove this rosette the footmen eagerly set to work, and the successful competitor leaping the fence forced his way through the admiring crowd to the Captain General's box and presented it—its sharp barb dripping blood—to his smiling daughter. Meantime, the bull, fretted by the cloaks which the *chulos* flaunted before his face, espied one of the horses. Paving the ground for an instant he sprang forward with a loud bellow, but was caught by the *picador* on his pike, and so firmly held that after several ineffectual attempts to advance he backed away from before the pain, but only to turn upon the other horse, whose rider, from want of strength or skill, failed to stay the powerful animal, and his horns ripped a ghastly wound through which the entrails protruded, while the poor blindfolded brute stood quivering with pain, and the walls of the amphitheatre resounded with the plaudits of the baser brutes looking on. The ladies, less demonstrative than the men, but equally desirous of expressing approbation, tapped their dainty palms with their fans, and lisped "Buenos!" "Buenos!" The ever-watchful *chulos* sprang to the rescue, and by skillful activity drew the attention of the bull, who, maddened to desperation, tossed to and fro the worrying rags, driving the holders for safety to their screens. Again he attacked the wretched horse, whose rider once held him at bay, and despite of every obstacle, although the sharp pike ploughed a deep furrow in his quivering flesh, over-turned both horse and rider; but the *chulos* were at hand and succeeded in enticing him away to another part of the arena, thus affording the *picadors* an opportunity to remove their wounded horses. Then appeared a *banderillero*, and watching his opportunity he adroitly planted two darts furnished with explosives deep in the shoulders of the bull, one on either side. The moans of the tortured animal were plainly heard above the shouts of the spectators, and as he looked up with an almost human appeal in his wild eyes the mute entreaty provoked only jeers and laughter. Although torn and bleeding he stood in the centre of that arena the only hero of the fight, and my heart was with him. The *banderillero* again approached to place a second pair of darts, but quick as a flash the bull caught and tossed him high in the air. I shouted with the loudest, and involuntarily breathed a prayer that the puny soul of the

fragment of a man might then and there find its everlasting abiding place. But on falling he hugged the ground and the curved horns of the bull failed to reach him. He was saved by the *chulos*, who twisted the animal's tail, and blinded his eyes with their cloaks. The injured man was removed and the lady patroness waved her hand for the *matador* to end the combat. But as if the spectacle was too pleasing to be shortened the people shouted "No! No!" but the lady was inexorable, and the *matador* attracting the bull by means of a small red flag plunged his sword between his shoulder blades, severing the neck and spine. For an instant the stricken animal stood transfixed, then with a shudder, fell forward upon his knees and sank slowly to the ground. A poniard, thrust just behind the horns, ended his misery, and the delighted multitude threw into the arena hats, handkerchiefs and cigars, so beside themselves were they with excitement. The band struck up a lively air, three gayly caparisoned mules galloped into the ring, a noose was thrown over the bull's horns, and the bloody carcass was dragged away. Six bulls in all were slaughtered, and the crowd separated greatly pleased with the afternoon's sport. (?)

For Forest and Stream.

HOW TO SHOOT AT LONG RANGE.

NUMBER TWO.

IT is proposed in this letter to consider the errors of the instruments themselves, viz: the rifle and its ammunition. There is very little fault to be found with the best target rifles as made by Remington, Maynard, Sharp, Burton, and others, except as regards their sights. The twist must of course be as sharp as one turn in eighteen or twenty inches, so as to give sufficient velocity of revolution to the projectile, which is a cylinder of at least three diameters in length; and the metal of the barrel must be thick and heavy enough to stand without excessive recoil and vibration the necessary charge of powder.

The sights, however, are generally inferior to those of the English long range rifles, and without good sights a rifle is useless. A rifleman should try the various kinds and stick to that which suits his eyes the best. We will describe those which we have chosen, after examining and trying all sorts, and which John Krider, of 2d and Walnut streets, Philadelphia, has attached to our Remington. The front sight is a well defined globe or pill supported on a slender stalk and enclosed in a tube three eighths of an inch diameter and same length. The whole rests on a plate moving in a notch. A thumb screw below it and attached to it, works in a piece of metal fixed to the barrel. By revolving this screw it moves the sight to the right and left and holds it *firmly in any position*. This last is an indispensable requisite. There is a scale divided into fiftieths of an inch on the movable part and a pointer on the fixed part. A movement of a fiftieth of an inch can thus be made and recorded. Each fiftieth of an inch movement of the foresight corresponds to two feet upon the target at 1,000 yards. This shows the necessity for delicate means both of adjustment and record.

The rear sight consists of two steel bars about five inches long, connected at top, bottom, and hinged to the stock behind the trigger in the usual way. Between them slides the sight-holder, and there is a fixed thumb-screw on one side, upon which the sight-holder forms a movable nut. By turning the screw either way the sight rises or falls. This is less cumbrous and less likely to be moved than the English sight with its double set of screws and clamp. The sight-proper consists of a cup-shaped disk, one and one-eighth inch in diameter and about one-fourth inch deep. This disk is made to unscrew from the holder so as to enable us to insert eyepieces with holes of different sizes according to the brightness of the day and the clearness of the view of target. On one side there is a vernier scale recording the actual elevations of the rifle to minutes. At the risk of being tedious we will describe how this is graduated, for there can be no just comparison of rifles unless their actual elevations are recorded, as from these elevations the velocities and trajectories may be calculated for every range.

Measure the distance between front and rear sights. Call this for example thirty inches. Set the rear sight the same distance above the axis of the bore as the top of the foresight. The line of sight then coincides with the line of fire, and thus is our base line, and we mark as it as O on our vernier scale. Now by a very simple problem of trigonometry we learn that the elevation of the rear sight will be the tangent of the angle of elevation, which is the angle included between the line of sight and the line of fire, and to mark a distance of one degree we multiply the distance between the sights by the natural tangent of one degree. In this case 30 in. x .0174551 = .523, say 52-100 of an inch, which we lay off on the scale measuring from the O mark. Put on as many degrees as necessary, say four. Divide each degree into six spaces of ten minutes each. Divide the width of a degree on the vernier into five spaces of twelve minutes each, and the vernier will read to two minutes by its lines, and to one minute when they do not coincide. One minute of elevation on the rear sight corresponds to about nine inches on the target at 1,000 yards range.

Now, considering we have such minute quantities to deal with, is it not foolish for people whose sights are knocked with the handle of an old knife and marked by a scratch of its blade, to try and compete with those who have taken care to provide themselves with instruments of precision?

The perpendicularity of the sight can be best attained in our judgment by the use of a little pendulum attached to the rear sight. This can be more easily seen than the bubble of a level placed near the foresight.

T. C. C.

MOOSE IN NEW YORK STATE.

PHILADELPHIA, March 6, 1874.

EDITOR FOREST AND STREAM:—

In your issue dated February 19th I find an interesting paper on the moose. In speaking of the geographical range of this animal the author alludes to several books, amongst others those of Audubon and Bachman on the quadrupeds of North America, and remarks, "It is quite certain that there was not a single representative moose in the northern counties of New York State when the last named works were issued." He also adds, "I think there has not been one killed within the State for the last sixteen years."

Permit me to take exception to the last statement. During the summer of 1861, a small party of Philadelphians, including myself, were encamped for several days upon Raquette Lake in the Adirondacks. Many of your readers will recollect the wild and picturesque stream called Marion river that discharges into Raquette Lake the waters of that beautiful, clear sheet of water called by some Lake Emmons, by others Blue Mountain Lake. It is a stream full of remarkable windings, a second Meander. We were camping on Raquette Lake right opposite the mouth of this stream, and used frequently to cross the lake, pass up the stream a few hundred yards, and try for speckled trout that were wont to frequent a cold spring-hole in the vicinity. It was almost three o'clock one afternoon of a beautiful golden day. We had been angling with some success, and were returning to camp for a late dinner. There were six persons in all, two boat loads. Our guides were rowing leisurely along, and the rest of us were enjoying the pure mountain air, the golden flood of sunlight, the sparkling waters, and the thousand genial sights and sounds of that grand wilderness region. We were rounding an abrupt turn in the river when we suddenly caught sight of a huge beast up to its waist in the water, and feeding leisurely upon the lily pads. We were within a half rifle shot of it before it perceived us. The first boat having no suitable weapon halted. Our guide instantly seized his rifle and sprang to the bow. The animal turned and walked slowly toward the shore, the mud in which he was treading preventing a more rapid exit. As it turned its huge flank the guide leveled his rifle. The occupants of the first boat discharged their guns, loaded with bird shot, at the ears of the creature with no visible effect except to provoke the laughter of the company. Our guide covered his game, but was very deliberate, waiting for a better exposure. Finally he pulled the trigger, and the beast dropped, quivering and dead, on the edge of the bank.

It turned out to be a large cow moose. After some effort we got her into one of the boats, which she weighed down to the water's edge. We all found place in the remaining boat and towed the moose behind us. I will remember that as we began to cross the lake a fresh breeze prevailed, and we were threatened with quite a sea. However, we got safely across. The moose was an acceptable addition to our stock of provisions, although she was not in very good condition.

Your contributor may therefore record that during the summer of 1861 a veritable female moose was shot on Marion river near Raquette lake, twelve years ago last summer. The persons present were Isaac Gerhart, lawyer; Mr. Burgin, Rev. Augustus Smith, now settled in West Philadelphia, and the undersigned, all residents of Philadelphia. The guide, who did the shooting, was one Palmer, of Long Lake. An account of this was recorded on the travelers' book at Bartlett's, on the Saranacs, as the party went out. I have understood the record is still there, but that sundry envious and disappointed sportsmen have indicated their disbelief of the story by certain ironical and sceptical comments. Nevertheless it is a true story, every word of it, and if Mr. Lamberton will visit Philadelphia I will introduce him to the parties, and will show him a bone taken from the foreleg of the beast.

E. C. S.

WATERPROOF PAINT FOR CANVAS.—The following is a cheap and simple process for coating canvas for wagon tops, tents, awnings, &c.; it renders it impermeable to moisture, without making it stiff and liable to break: Dissolve soft soap in hot water, and add thereto a solution of sulphate of iron. The sulphuric acid combines with the potash of the soap, and the oxide of iron is precipitated with the fatty acid as insoluble iron soap. This is washed and dried, and mixed with linseed oil. The addition of dissolved india-rubber to the oil improves the paint.

—We find a floating paragraph which states that frogs will shriek if subjected to torture, and instances a case where a frog was slightly struck with a small switch. At first it sought to escape by amazing leaps, but finding the effort fruitless, it commenced to cry, its plaint imitating that of a small child so nearly as to have deceived any one not aware of the kind of creature from which it emanated. The cry appeared to be caused by fear, and not actual pain, for the switching was so gentle that it could not have given pain.

—A gray hair was espied by a lady among the raven locks of a fair friend of hers a few days ago. "Oh, pray pull it out," she exclaimed. "If I pull it out, ten will come to the funeral," replied the lady who made the unwelcome discovery. "Pluck it out, nevertheless, said the dark haired damsel; "it is of no sort of consequence how many come to the funeral, provided they all come in black."

—A hooded owl has been captured near Centreville, Leon county, Florida. The bird is of a white and yellow color, with a snowy hood around the face. When provoked, he swells out and utters a hissing sound like a small steam escape.

—When you see a woman winding her watch in a horse car, you may make up your mind that she has not had a watch very long.

For Forest and Stream.
THE MEGALLOWAY.

MURMURING through the forest's glades,
And in its cool recesses,
Singing through the tall reed blades,
O'er moss and water-cresses;
Where the flickering shadows play
Runs the swift Megalloway.

Down the rugged mountain side
Beneath the long-limbed beeches,
Where ferns bend o'er its foaming tide,
And sun light never reaches;
Flecked with spots of snowy spray
Leaps the bright Megalloway.

O'er shattered trees and river rocks
The restless water dashes,
Where, from the tumult of the shocks,
The snowy mist-cloud flashes;
Ever onward to the fray
Roars the fierce Megalloway.

'Mid unsown fields of tall wild rice,
And beds of tangled rushes,
Where in the fall the sweet swamp spice
In crimson beauty blushes;
While on it's waves the sun beams play
Sleeps the calm Megalloway.

W. A.

For Forest and Stream.
THE HUNTER NATURALIST.

NUMBER TWO—THE MOOSE.

HAVING in a previous article given the scientific diagnosis of the *alce* (Hamilton, Smith, and Jardine), in this will be delineated its peculiarities and habits. Moose are the largest living members of the deer family; a mature male standing higher than the average horse, measuring from seventeen to eighteen hands, and often weighing over a thousand pounds. The males are considerably larger than the females. Their color is quite variable, depending upon season and climate, some being of an ashy gray, others of a darker grey, and a few in the autumn a glossy black. The extremities of their hairs are usually brown or black, and toward the centre and roots dingy white.

I have seen in the wilds of Nova Scotia moose with sparkling grizzly coats in September. The young are of a quakerish brown color, which grows darker with age. The hair is exceedingly coarse and strong, and somewhat brittle. That it breaks when bent is not true, since the squaws color and use it in their ornamental work. With the advance of winter the coats assume a darker hue, and the hairs grow longer and thicker. The necks of the males are surmounted with a mane of stiff hairs, varying in length from five to ten inches, which, when the animals are enraged, bristle up like the mane of a lion. Two fleshy appendages—dewlaps of loose skins—hang from the throat, and are covered with long black hairs. The tail is very short, so short that Thoreau, in an examination of a moose in the Maine woods, overlooked it altogether. The most striking peculiarities of these animals are enormous length of legs, head, and ears, short and thick body, small eyes, immense nostrils, and an elongated, thick, ponderous, and flexible upper lip. And this lip is so peculiarly and curiously constructed as to warrant a full and particular description of its formation and use. Some writer has aptly described it as "of a size between the lip of the horse and that of the tapir." It is square in shape and furrowed in the middle, appearing divided. The varied and rapid movements of this heavy protruding muscular development are due to four pairs of strong muscles arising from the maxillaries. This seemingly awkward and misshapen organ is not traceable to any freak of nature, but is thus purposely formed. These peculiarities, that some denominate inelegancies of form, but which declare afresh the beautiful law of God, everywhere present in organized beings particular adaptation to circumstances. These animals, when viewed in the light of this law, are symmetrical in proportion and graceful in appearance. The feet of the moose, though peculiarly developed, cannot be termed awkward or clumsy after close examination. The hind hoofs are perfectly formed, and so well proportioned as to make a beautiful foot; long, slender, convex, and tapering. The horny points or spurs, and not the hoofs, make the clattering sound when the animal is in motion. The fore feet are flatter, somewhat shorter, and less tapering than the hind feet, and are, we think, more common and unattractive. The feet of the moose are very different from those of the caribou (*Rangifer*, Hamilton Smith), the hoofs of the latter being much shorter, wider, more covered, and not so pointed at the toes. The hunter can, after seeing the tracks of these different animals a few times, distinguish one from the other at a glance. The feet of the moose are susceptible of greater expansion than those of the caribou. I have found the average size of the mature *alce* foot to be about seven inches from the heel to the toes, four inches across the widest point on the concave side when the foot is closed, and about three quarters of an inch across the points of the toes. The hoofs may be spread until the toes are four inches apart. I have, however, found tracks in very marshy places measuring from back of the horny points to the extreme tips of the toes ten inches, and across the widest point on the concave side of the foot six inches. In the foot of the moose we have another illustration of special adaption. These animals live during the summer months in immense swamps, where, if the hoofs did not

expand to bear them up, they would often sink so deep in the mire as not to be able to extricate themselves, and when pursued their progress would be so retarded as to cause them to fall an easy prey to their enemies. This also enables these animals the better to travel in the deep snows of winter, and at all times to leave less of a trail for the cunning Indian hunter than these heavy beasts would were their feet otherwise formed. The legs of the moose are without the metatarsal gland so characteristic of the genus *cervus* group. The peculiar lip, long legs, and short neck have direct reference to the uncommon mode of life of these animals. They live only in forests, and subsist alone by browsing, since in the wild state they never graze. They will trail meadows of wild grass without feeding, but when tamed they eat grass. Moose are constructed for the woods, and not for the pasture. Their long fore legs enable them to reach far up into birch and maple trees to secure the tender and nutritious branches, and who will say that these are not wisely formed, since without them they could not so well feed on the side of deep acclivities where the moosewood and the willow trees grow in great abundance? And by these giraffe-like legs they are also enabled to obtain foliage out of reach by riding down young trees. And the lip is used as a hand in seizing, tearing off, and gathering the twigs and leaves of trees and carrying them to the mouth. The teeth of the moose have one peculiarity not common to the ruminants. In the molar tooth appears a fine illustration of what naturalists call intentional structure. That it was formed by an intelligent Creator for a specific work in this animal is evident. It could not seemingly have been brought about by natural selection. The remarkable modification of the crown of the molar tooth in the moose, deep cleft, and the enamel surrounding the cutting edges unusually hard and sharp, must have been formed to enable the animal to masticate the dry, coarse branches and bark of trees upon which it subsists from necessity in winter and through choice at other seasons of the year. Much of the noble appearance of the bull moose in his native haunts is due to his horns. In the spring time, when void of these weapons of war and articles of ornament, he is as changed as the peacock without his tail of beauty and glory. The female moose, on account of having no horns, never strikes one as remarkable. The antlers of the moose vary much in size and shape in the same adult animal every year. As a rule, the heaviest and most perfectly developed are grown in seasons most favorable to vegetation. The abundance or scarcity of food, rather than other causes, determines their form and weight. The young bull moose grows two knobs, of from one to two inches long, the first season. These are not cast in the fall of the first or second year. When a year old these knobs are developed into spike horns, varying from five to eight inches in length, and remain on the head until the following April or May, when they drop off, and are replaced by long cylindrical or forked horns; in the fourth year they begin to branch forward and become palmated; in the fifth and sixth years they grow in a triangular form, the palmated portions ending in from five to eight points or fingers, the whole resembling an expanded hand. The moose produces the most perfectly developed antlers after the fifth year, the horns of a mature animal often measuring from the root to the extremity, following the curve, four and five feet across from tip to tip, and the palm on the widest surface sixteen inches. They cast their horns annually after the second year during the months of December and January, and so prodigious is the growth that by the following August they are furnished with a new and complete set. During the summer months these are covered with what hunters call velvet. During the velvet state the horns are so tender as to bleed freely when cut, and may like vegetables, be sliced with a knife. They begin to harden in the month of August, and I have seen two of these animals in the latter part of this month (August) with peeled and ripe horns. Usually, however, it is in the month of September that this velvet peels off and leaves the antlers hard. This covering is as thick as the hide of the moose. In August the velvet splits into narrow pieces, and oftentimes the antlers are seen draped with ribbons. Only the males have horns, yet I have been told of three cows killed bearing small antlers. This is not impossible, since female deer (*C. Virginianus*) have been known to bear horns.

Below are the dimensions of a pair of horns of an unusually large moose, killed in Nova Scotia, and measured by the writer. The branches of this pair of antlers differed very much, as much as if grown by separate animals. One had two distinct palms; the first was seven inches from the base, with four well developed fingers, varying from six to eight inches in length. This palm, at the widest part, was seven inches across, and from the root to the extreme point of the first palm, not following the curve, but passing over the centre, eighteen inches. The second palm measured from the second point of the branching of the two, following the centre to the extreme finger, thirty-two inches. The first finger on this palm was fourteen inches long, the second seven inches, the third four inches, the fourth and the last four two inches. This palm was at the widest point fourteen inches across. The other half of the antler had but one palm, which was in every way inferior to either palms of the other antler, the wrist or arm extending from the base to where the first palm was on the other half. Here it forked into two fingers of ten inches in length each.

The wrist was about eight inches to the palmated portion, and from the end of the wrist to the extreme point of the palm thirty-one inches, upon which were but five fingers. This only measured at the widest part nine inches. The first fingers of this pair of antlers were forty-eight inches apart, and the extreme tips forty inches. The antlers weighed sixty and a half pounds.

It is now conceded by all naturalists that the horns of the deer family furnish no clue to their age. Of course, the horns of very old moose can be readily distinguished from young animals in their prime. On old moose, as a rule, they are contorted, ill-shapen, and have a bleached appearance, with the tips or fingers but partially developed around the outer edge of the palms. The reason that no correspondence exists between the number of prongs or horns of deer and their age is that they are the distinct product of one year. In the ox kind (*Bos taurus*), which do not cast their horns, but have an annual ringlet after three years up to the ninth year, the age is readily determined.

The period of gestation with the moose is about nine months. They bring forth about the middle of May one calf the first and second years, and afterwards two at a birth. Very old cows become barren. With the mother the summer is a season of retirement. She goes alone to the wildest, unfrequented, moss-covered swamps of the forest, and never leaves them until the month of September, when she comes forth to select a companion. No doubt but that she withdraws to these deep recesses near lakes to protect her young from carnivorous animals and the bull moose. The calves continue to follow the mother long after she ceases to feed them. It is probable that in many cases they keep with her until they are two or three years old. I have on more than one occasion trailed for two or three days a cow moose accompanied by a calf and yearling. My guide says that many winters ago he found in moose yards, at two different times, cows with a two year old yearling and calf. Although the male moose resorts during the summer months to morasses and low situations, they keep separate from the females.

The moose is a timid, retiring animal, which delights in evergreens, moisture, and perpetual silence, scrupulously avoiding the society of all other animals. In old age the moose becomes sullen and morose. Separating from its kind, it dies alone in the solitude.

I was surprised to find that while the caribou (*Rangifer* H. Smith) is found inhabiting many of the districts with the moose, that its feeding and tramping grounds are separate. It trails and feeds around moose habitations without encroaching upon their territory.

Moose suffer quite as much from hot weather as do our domestic cattle. During the hot season they remain quiet in the vicinity of lakes, feeding on aquatic plants, standing much of the time in water, where they will remain for hours immersed with nothing but their noses above the surface. This they do to cool themselves, to escape from black flies and mosquitoes, and especially to rid themselves of two large breeze flies (their special enemies), one grey and speckled, termed moose fly, since they are especially fond of these animals. They also frequent the margins of lakes and streams to feed upon the roots, stalks, and leaves of the yellow lily. Their habit of reaching under water, so as to feed on the roots of these water plants, gave rise to the Indian belief that the moose possessed the power of remaining under water the whole day. That they entirely disappear from view when thus feeding is well established, but that they can live under water for any length of time is only credited by Indians. They are strong and rapid swimmers, and have been known to cross a distance of two miles from one shore to another. Neither do these animals thrive well in severe cold weather. We are inclined to think that they suffer much during hard winters. Of one thing we are certain, that with the approach of winter they commence to feed on the southern slopes of heavily wooded ridges that descend to fir thickets, that they may find cover in extremely cold days. That they are found inhabiting the northern portions of the two continents would seem to contradict this opinion. This would be true were we not speaking of the extreme cold weather common to the most northern latitudes. We have the authority of Nellsson, the Swedish naturalist that the elk cannot endure so cold a climate as the stag. The moose on the 1st of September, the beginning of the rutting season, commence to "travel up," as the Indians term it, and in a few days work out of the bogs and marshes and appear on the higher lands of the forest. During this period—September and October—the bull moose drinks and feeds but little for days at a time. He stalks the forest a proud, haughty, defiant monarch, conscious of his strength and beauty, with horns stripped of the last ribbon of deciduous skin, and polished by constant rubbing against the lacinated bark, and with immense round powerful neck, and in the finest bodily vigor and condition. He goes forth to assert his demands among his rivals. He is no longer timorous and shy, but bold, defiant, and dangerous. His weapons are his horns and hoofs, and few animals can use the latter to better advantage. It is reported that the animal can with a single blow of his hoof kill a wolf. During this season he has been known to rush at a man with intent to kill. A moose hunter on the Mirimichi River, New Brunswick, told me that while hunting some twenty years ago he wounded slightly a bull moose, which he trailed over a mountain, and unexpectedly

met the animal on his back track, which made a rush at him, he only saving his life by throwing himself on the ground while the animal dashed madly by. Another time, while far up the same river, guiding a gentleman from New York, when turning a bend in the river, they saw standing in the water one of these noble animals. He (the guide) called in imitation of the cow; the bull answered, and came down until he appeared in sight of the boat, when, on discovering the deception, he became terribly enraged, striking the water with his feet, making it fly high in the air, and dashing it first one way and then the other with his horns, frightening the sportsman in such a manner that he failed to shoot him.

In this season no animal could present a nobler appearance. View him as he stands with glossy coat glistening in the early sun, with wide-spread antlers upward stretched like the hands of some fabled god, and say if you can, that there is nothing in him to admire. He at times during this period becomes furiously mad, tearing wildly through the thickets, pawing the earth with his feet, and making dead branches crack like pistol shots. This is when, as the Indians say, he is "real mad." This is in reality the bellowing season. The bull roars, and utters his peculiar, short, guttural sounds, and the cow pours forth a wild, prolonged call. The latter goes forth of a still October night, with the going down of the sun, to some high barren ridge, surrounded with deep and heavy forests, and there she bellows forth the wildest of strains until answered by the bull. We believe the call may be heard on a still night three miles or more. The bellow of the moose is the deepest sounded and wildest to be heard in our forests. During this season the bulls fight many desperate battles. In these conflicts one or both are killed.

John Logan, the renowned guide of Nova Scotia, told me that while trailing late in the fall he came upon the remains of two dead moose that had killed each other. Their bodies were terribly pierced and bruised, a portion of the horn of one was broken off, while the side of the other had been pierced by a prong. There they lay, foes joined in death. "John," I asked, as we sat one night smoking in front of our camp fire, "did you ever see two moose fight?" His eye fired as he answered yes. "Well," I replied, "give me the story, I am just in the right mood to hear it." "It was," said he, striking his pipe against the log of our camp, "twenty falls ago. I had just come home from sea. My cousin said, 'John Logan, do you want to go over to Yarmouth moose hunting day after to-morrow?' I said yes, no care if I do. We started; my cousin was guide and I was gentleman. First night after getting into camp I called. No answer came. Next night my cousin called. Two bull moose answered from opposite ways. We heard them coming, talking savagely to each other. On they came, making as much noise as if this camp was carried right through the woods, striking their horns against the bushes and bellowing terribly. We kept perfectly still; moon made night very light. Now they came out of the thick woods into sight. Two great fellows, I tell you. They moved right up toward each other until they got on top of the ridge in front of me and my cousin. No fight right away; one little 'fraid of other. They commence going round and round; come closer and closer each time; pretty soon they made right at one another, when they hit. Upon Indian's word, they sound just like that thunder last night. What hard fight! Indian never saw two animals fight like that before. Soon one got advantage of other and threw him. He right up and at it again; when they struck sound like a shot gun. Indian could stand it no longer, so he took aim on the biggest and pulled. Before he fell the other turned him right over backward just as easy as I turn that cup. Jumping one side two or three steps he stood ready for fight, thinking he had knocked the other down. As he stood there, not knowing what had happened, my cousin raised his rifle and shot him. You wouldn't think," he said to me, "how spry and smart such big moose are when fighting; jump just like little lambs."

I have been assured by more than one moose hunter that they have witnessed such scenes as those described by John. I can testify that the moose on certain occasions are spry and quick of motion. I remember once of having made an exceedingly poor shot at a noble moose that stood on the edge of a large barren. With the report of my gun he made as graceful a bound, and disappeared as rapidly from view, as ever did roe or Virginia buck.

With the close of the rutting season (November 1st) the bull moose appears like another animal. He no longer trails through the forest bidding defiance to his foes, but mopes along with downcast head and dragging limbs, paying little or no attention to passing events. His coat is now rough and dingy, and his antlers seem to serve no purpose save as a heavy weight to keep his head bowed down. He is cadaverous, gaunt, and exceedingly stupid. Recovering not from his fall campaign, he remains poor until the next spring, when he again rallies. About the 1st of November moose begin to look about for winter quarters. These are usually selected with reference to the abundance of white birch maples (white, striped, swamp), poplar, witch hazel, mountain ash, and the different species of firs. From most of these trees I have picked specimens on which were indications of their browsing.

While moose are not gregarious, several are often found feeding together in what are called moose yards. These yards are simply their feeding grounds, and are made by the animals' constant browsing about the pasture grounds, and are not the result of plan or thought. During the time of the falling of snow they go around browsing, following each other unconsciously making paths. Of course, this

process is kept up every day, so that when the snow becomes very deep they have well beaten roads running in every direction over quite a large territory. They have a very delicate way of eating, nibbling only a little at a time. It sometimes happens ere the snow lies very deep on the ground that they change and form new yards. They never venture far, however, after the first snow falls, in search of new browsing pastures, and the change is never made unless there be a necessity for it in the scarcity of food and imperfect shelter. I do not think that the moose can be strictly called a migratory animal, since they never leave their native ground and forests for strange lands and woods. True, they are obliged to visit and live in the different neighborhoods of their own wilds in order that they may obtain sufficient food, but this can hardly be called migration. The moose is easily tamed, and can be broken to the harness without much difficulty. There was one some years ago, owned by an old man in Nova Scotia, which he drove to town and drew wood with. The author of "Camp Life" tells us of riding several miles in Maine after one of these animals. From Pennant we learn that they were formerly used in Sweden to draw sledges, but the escape of criminals being often facilitated by their speed their use for this purpose was prohibited under heavy penalties.

The enemies of the moose are the black bear (*Ursus Americanus*) and the wolf (*C. occidentalis*, variety *griseolabus*). Wolves are not common to all the districts inhabited by these animals, but when found together the wolves hunt them in packs, and though one or more may fall before a thrust of the horn or blow of the sharp hoof, yet they are sure in the end to kill. The cows and their young suffer most from the wolf and the bear. The bear seldom ever makes an open attack upon the moose, but approaches in a stealthy manner, and thus secures his prey without much difficulty. I once saw where a bear had made a spring from a hiding place upon two bull moose as they passed along. It had missed its game, but pursued the two for about half a mile, when the trail was abandoned. I have never seen the moose give evidence of such speed as in this chase. The first few jumps after discovering the bear measured twelve feet. When striking into a trot their strides were immense.

The moose is thought to attain to a great age, though there is nothing positive as to their length of years when wild. It is very doubtful whether the moose will live as long in a domesticated state as it would were it to remain in the wilds.

These animals give evidence of possessing exceedingly delicate feelings—love, jealousy, and hatred. These are expressed in various ways. The following story will illustrate their capacity for education and attachment:—"I procured in India," says D'Olsonville, "a young elk of ten or twelve days old, and had it for about two years without ever tying it up. I even let it run abroad, and sometimes amused myself with making it draw in the yard or carry little burdens. I accustomed it to eat anything; it came when called, and I found few signs of impatience, except when it was not allowed to remain near me. When I departed for Sumatra, I begged Mr. Law, governor general, to accept it. This gentleman had no opportunity of keeping it about his person, as I had done, so he sent it to his country house, where it was kept alone, and being confined it became so furious as not to be approached, even by the person who daily brought it food. After some months' absence I returned. It knew me afar off, and as I observed the efforts it made to get at me I ran to meet it, and I confess I can never forget the impressions which the caresses and transports of this unhappy animal made upon me. A friend of mine who was present at this meeting could not forbear to sympathize with me and partake of my feelings."

A. B. LAMBERTON.

Woodland, Lawn and Garden.

PREPARATION FOR SPRING FLOWER PLANTING—THE HOT BED.

"Give fools their gold and knaves their power.
Let fortune's bubbles rise and fall,
Who sows a field, or trains a flower,
Or plants a tree, is more than all."

AT this season of the year, when indications of spring are daily increasing around us, and the cheerful notes of the blue bird and the piping of the robin remind us that the reign of the winter solstice is drawing to a close, we would remind our readers—ladies and others interested in the planting of garden seeds—that now, as soon as the ground is in good order, they can begin to plant out their seed with a view to embellish and beautify the little garden plat before their city homes. Many of our lady friends purchase good seeds and sow them in the hopes of a bright and glorious resurrection of flowers a few weeks later. They sow, to be sure, in hopes, but alas! their hopes are in vain. To such we would say, be not discouraged by your first failure. Try again; the best efforts sometimes come to naught. The most careful florist, the skillful cultivator, will sometimes fail of success. But he stands not idling away the spring time, but with cunning hand and cultured mind scatters the tiny seeds upon the lawn, in the garden, and by the wayside that shall anon spring up in all the flashing beauty of a paradise of crimson crosses and golden stars, a profusion of vine and tendril, of bud and flower, in a gorgeous multitude to dazzle and gratify both eye and taste.

To all who have the ambition to try, or the taste to desire to improve their homes, we would give a few practical sug-

gestions upon the same, which may not be out of place in this department of FOREST AND STREAM.

As many of our lady friends have not perhaps a "hot bed" for raising flowers, we would give them a few directions for making a cheap and proper frame of sufficient capacity to grow a large number of valuable flowers. Now heat is the first principle needed in the raising of flowers, and a hot bed is only the receptacle of a large or small quantity of any fermenting material that in its decomposition and chemical action produces heat. This heat, to be made available for our purpose, must be raised considerably above the atmosphere in which it is placed. The necessary degree of heat for the culture of the different kinds of seeds sown in the prepared bed is quite easily learned. Of the different substances used in making a hot bed, I have always found the best to be a good strawy stable manure. This you can readily mix with other animal or vegetable matter, refuse, and decayed leaves, which should always be gathered in the autumn months. This basis for hot beds, if possible, should be kept under a shelter of rough boards, if nothing better offers. One good cartload will be found amply sufficient for a small hot bed, capable of raising a good, generous supply of the different kinds of plants wherewith to stock your garden beds and border walks. This manure should be broken up finely with a fork, and thrown up lightly in a cone-shaped heap, where it will soon ferment and become warm enough for the preparation of the receptacle which is to receive it. Sometimes when thus treated the heat may become too strong, or the temperature hot, and here you are to be very careful and watch your operations closely. Remember, when making your bed, that too great heat is far less preferable than to await a later period of planting and then plant in the open air. The manure heap should be turned over with a fork two or three times during two weeks until decomposition has become somewhat perfected, and then thoroughly broken up into fine fragments, or shaken up. When you find it in this stage it is ready to be placed in the bed. You will make your bed of any size you deem the most convenient, say five or six frames two feet and six inches in width and of proportionate length. Throw out your bed to the depth of eighteen inches, and put a frame of plank or board inside, having the back side eight or ten inches or so above the surface, and the front side some four inches less than the front, or at an inclination of from four to eight inches. This frame may be one foot smaller than the bed. The fermented preparation is now to be thrown in and levelled, and very regularly spread over the bottom of the bed, and then varied in successive layers until you have raised it to the height you desire. The upper surface should be made quite level, and the frame and sash set firmly upon it. In about forty-eight hours the retarded fermentation will begin again, and considerable steam will be seen under the glass. You will now add finely sifted, good garden soil to the depth of four or five inches. Now your bed is ready to plant seeds or plunge pots within the frame.

If your hot bed is made after the above recommendation you have little fear of making it too hot. Neither should you forget that the temperature of the soil or the atmosphere over it should never exceed sixty degrees. This may be permitted to fall to forty and forty-eight degrees without injury to the plants. You will find a thermometer of much value in regulating the heat of your hot bed. The 1st of April is the time you will begin in earnest to make your hot beds. Thus, if you have good success, your plants will be ready to plant out from the 10th to the middle of May.

Now we leave our lady friends to prepare their hot beds, and in our next we will take their plants, which have just come up, and are showing from one to three leaves, and tell them all about other matters and things in relation to the future of their little seedlings. OLLIPOD QUILL.

✕ THE ZOOLOGICAL GARDEN.—The Zoological Society have received \$91,000 toward a garden, and there are now four hundred members. The grounds have been laid out, and a handsome gate house has been erected. A fancy building for monkeys, a deer house, and bear pits have been finished.

The animals now in the garden consist principally of donations, and number about two hundred. Among the larger are two full grown buffaloes; one grizzly, one cinnamon, two black and two brown bears; elks, black tail deer, etc., etc. In the collection there are also marmosets, silver gray foxes, prairie dogs, several varieties of wolves, hedgehogs, ravens, eagles, parrots, birds, of different kinds, etc.

A large aquarium is soon to be commenced, \$10,000 having been donated for that purpose by gentlemen interested in the science. Mammoth tanks, containing fresh and salt water collections, will be placed therein. When completed, fresh water reptiles from all parts of the world, can be seen, making this building one of the most interesting features of the garden.

A letter just received from the Superintendent of the garden, who is collecting animals, dated Melbourne, Australia, states that he has secured a large collection of the birds, animals, kangaroos, etc., of that far off land, which will be shipped to Philadelphia via San Francisco, May 4, arriving in time for the opening of the garden. He was about to leave for India to secure lions, elephants, etc., which he hopes to have here by the same time.

The last paragraph surprises us. If the "garden" is going into the general menagerie business, it will cost a mint of money and we should not like to be one of those responsible for the endless outlay.—*Germantown Telegraph*.

—A monstrosity was still-born at Rutland, Vermont, a day or two since, being a calf with two heads, two necks, two well and fully formed breasts, and having six perfectly formed legs—four front or fore legs, and two hind ones.

Delaware—All the rules for killing Birds, Fish or Game in this State are irregular and inefficient. In Kent, or Sussex, or Newcastle no partridges or pheasants to be killed between the 1st of February and 15th of October, nor any woodcock between the 1st of February and 1st July.

*An act is now proposed before the Assembly making the close season January 1st to September 1st.

+Reed Birds and Rail, close time from December 1st to September 1st.

The California bill is before the Legislature, but not yet passed.

This table is compiled from the game laws of the several States as we find them, and if there are any errors our readers must not hold us responsible.

In Virginia there are no general protective laws. The killing of deer is prohibited between January 1st and July 15th.

Kent, or Sussex, or Newcastle no partridges or plovers to be killed between the 1st of February and 1st July.

r readers must not hold us responsible.

In Virginia there are no general protective laws. The killing of deer is prohibited between January 1st and July 15th.

We have now stated the facts and the necessities of the case. We propose a practical application of the remedy, premising (and taking the highest English authority as judges of the question) that "it is a known fact that all the best measures for the protection of game, the most judicious, not only for the sportsmen but for those who gain their subsistence by shooting and fishing, must always emanate from those who shoot and fish for their pleasure." Ordinarily, those who legislate, those who make the laws, are not practical sportsmen, or so well informed on the subject as to serve advantageously as scientific economists. It is proper, therefore, that the drafts of any bill or bills to be submitted to future legislative bodies should emanate from the sportsmen, naturalists, and fish culturists of the country, who make our game animals, their habits, their protection, their pursuit, and their propagation a constant and intelligent study. The remedy, then, and its application, lies in the co-operation of all the scientific and acclimating societies and sportsmen's clubs in the Union, and we are herewith encouraged by the Game Protective Society of New York and the American Fish Culturists' Association of the United States (to both of which the scheme has been presented) to lay before all these clubs and associations the importance of calling at an early day a convention of sportsmen, naturalists, and culturists to select a board of arbitration or reference, which shall prepare a suitable draft of a law to be pressed for passage upon the legislatures of the respective States, this reference to be final, the Legislature to sit as a committee of the whole, and the bill to be either rejected or accepted unconditionally. Legislators who have the interests of the country at heart would not be jealous of their prerogatives in such case; indeed, they should be gratified to be relieved of the arduous labor and responsibility of so important a measure. We have received a great number of letters urging this movement for a general convention, details of which will soon be published, and we have no doubt that all clubs will readily fall in with it.

At the convention of Fish Culturists in February, we first introduced this scheme to their attention, and a resolution in conformity therewith was unanimously adopted by them as respects "fish and birds," the word "animals" being inadvertently omitted.

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

ON STOCKING PONDS.

BY A. S. COLLINS.

IT is commonly supposed that any pond is good enough for black bass. If any one has a pond or stream which is too warm or sluggish for brook trout, he is told by his sporting friends to stock it with black bass. As some of the varieties which are popularly called black bass will live in such places it is necessary in order to make my meaning plain, to define the term "black bass."

Well then, according to DeKay, a *centrarchus fasciatus* is a black bass, and according to Agassiz a black bass is a *gristes nigricans*, and according to Professor Gill either or neither are black bass; or rather there are only two kinds of black bass, the little mouthed bass and the big mouthed bass. While Mr. H. J. Reeder says that a *gristes salmoides* is a *centrarchus fasciatus*, and that a *G. nigricans* is either.

Now, Mr. Editor, in such a state of affairs, what is a plain and unlearned man to do, unless he calls the fish in question simply "black bass?" They will not live in a sluggish stream, nor in a pond or lake which gets very warm in summer. Any large stream which has a good current, a current swift enough to keep the bottom of the channel clear, with a rocky bottom, will support black bass, if the temperature of the water does not rise very high in summer. Any lake which has sufficient change of water to keep a clean rocky bottom, and has springs enough in it to keep the water moderately cool in summer, is also good. But if they are put into a sluggish stream which deposits enough sediment to make a muddy bottom, or if they are put into a pond or lake which has a similar character, they will not live. Or, to put in a saving clause, if they should by any means live, it will not be as black bass. They will sink into a muddy soapy fish, which will not take the fly with a snap, or break from the water when fast, and will become degenerate specimens of a once proud and noble (black) race. The black bass have never artificially propagated. Nor is it practically necessary that the process should be discovered, as a few pair will soon stock a large area of water. They make a nest in summer and cast their spawn, and take care of them while they are hatching by fanning them with their fins and keeping them clear of sediment and enemies, and giving them the proper change of water while they are hatching. Their increase is 100 per cent. more than any other good kind of fish.

It is the general impression that they care for their young and protect them for a certain time. If any of your readers have observed their habits in this respect, it would interest many of us if they would send you their observations.

CALEDONIA, N. Y.

—We clip the following from the Boston Journal of the 27th:—

A meeting of the Commissioners on Inland Fisheries was recently held at the State House, for the purpose of mutual consultation in regard to the collection of land-locked salmon eggs. Massachusetts was represented by E. A. Brackett and Asa French; Maine by E. M. Stilwell and Henry O. Stanley; New Hampshire by Dr. W. W. Fletcher; Vermont by Dr. M. C. Edmunds and Dr. M. Goldsmith; Rhode Island by John G. Barden; Connecticut by Dr. Wm. M. Hudson, Robert G. Pike and James A. Bill. Mr. Chas. G. Atkins, Superintendent of the Penobscot Salmon Breeding Works at Bucksport, Me., which was established for the collection of sea-going salmon eggs, was present by invitation. These works are owned by the States named above, together with the United States, which are represented by Professor Baird, the United States Commissioner. Arrangements were made for the prosecution of the work during the coming year, and funds were subscribed for that purpose. It is expected that Prof. Baird will get an appropriation from the United States Government to aid in the work being carried on at Bucksport. Mr. Hiram L. Leonard of Bangor, who is collecting land-locked salmon eggs at Sebec Lake, on a tributary of the Penobscot River, was also present at the meeting. Connecticut and Massachusetts and the United States Commissioner are at present the only parties interested in the eggs of land-locked salmon, but a discussion was had relative to admitting during the coming season the States of New Hampshire, Rhode Island and Vermont. A full expression of views on both subjects was had, and satisfactory arrangements made for the prosecution of the work at Bucksport and Sebec Lake during the coming season.

—The subjoined is a copy of the law just passed by Wisconsin appointing fish commissioners:—

An act to encourage the artificial propagation and the introduction into this State of the better kinds of fish. The people of the State of Wisconsin represented in Senate and Assembly, do enact as follows:—

SEC. 1. There is hereby appropriated out of any money in the State treasury not otherwise appropriated the sum of three hundred and sixty dollars to be expended under the direction of three commissioners, to be appointed by the Governor, whose duty it shall be to confer with Prof. Spencer F. Baird, United States Commissioner of Fish and Fisheries, and receive from him all spawns of fish of all kinds donated by the General Government to the State of Wisconsin.

SEC. 2. It shall be the duty of said commissioners upon receiving any such spawns or fish, by or through the said United States Commissioner of Fish and Fisheries, to immediately place such spawn in the care of responsible pisciculturists of the State and by them to be hatched and distributed in the different waters in and surrounding the State.

SEC. 3. This act shall take effect from and after its passage and publication.

Approved March, 1874.

The commissioners appointed were William Welsh, T. C. Dousman, and Alfred Palmer.

—There have recently been placed in Long Island Pond, near Sag Harbor, 50,000 young trout from the head waters of Lake Michigan.

The Horse and the Course.

—The Central City Park races at Macon, Georgia, took place on March 26th and three following days. The second day the weather was bad and the track heavy. The first race—a one and a quarter mile dash, for all ages—was won by Revenge, in 2:22, beating Fireball second and Nashville Harry third. The second race was a three-quarter mile dash, and was won by Quits, in 1:26½, Belle of Australia being second and Pretty-by-Night third. The third race was mile heats, best two in three. It was won in two straight heats by Tabitha, Chief Engineer being second, and Joe Johnston being distanced in the first heat. Time, 1:54 and 1:55. The third day the weather was fine and track in splendid order. The first race, a mile and a half dash, was won by Revenge, beating Tabitha. Time, 2:40. Limestone ran, but carried an overweight, and was badly jockeyed. Bets on him were declared off. The second race was a mile dash for two-year-olds and was won by Vandalike, beating Letitia H. and the Belle of Australia. Time, 1:50. The third race for mile heats, best two in three, was won by Ortolan, beating Joe Johnson and Fireball. Time, 1:48½ and 1:49½.

—The death of Count Johannes Maria Renard, a leader of the German turf, is a late event to be much regretted. Count Renard may have been known to some of our readers when attached to the embassy at Washington. The owner of a large domain in Silesia, he devoted a great deal of attention to the raising of horses, importing the finest English stock into Germany. Two of his horses, Hochstapler and Amalie von Edelreich, he landed as winners on the English turf. In Berlin Baron Renard was celebrated for his hospitality. Besides being an agriculturalist of distinguished merit, he occupied an important position in German politics.

SOME HINTS ABOUT HORSES.—Over forty years' experience in the management of horses has taught me that one of the best things to prevent bots and worms in horses is to give them, in their feed once a week, for about four or five weeks, in the spring of the year, a small handful of wood ashes and a lump of rosin the size of a walnut, pulverized. Great attention should be paid to horses' feet. Many fine horses are ruined by neglect of this attention. Never let your horses stand in stable litter. You will also find it of great benefit to keep in your stable a vessel with chamber lye in it, and in warm weather wet well and swab the feet with it. Great care should be taken in shoeing horses. First, have all the loose scurf taken out of the bottom of the foot, and any loose rags on the frog smoothly taken off, but nothing more. In buying a horse look particularly well to his feet, and never breed from a horse with a contracted hoof.—Exchange.

PROMOTING GROWTH OF MANE.—Midy Morgan gives this recipe for accelerating the growth of hair on the manes and tails of horses. She says: Take corrosive sublimate (hyd. bichloride), oxymuriate of mercury, each four grains, in one ounce of distilled water. Wash the parts where the hair is thin with warm water and soap, then rub with a linen cloth, and immediately after rub in some of the above liniment. If the hair has been rubbed off by the animal's own endeavors to allay cutaneous irritation, then dress with the following ointment: One ounce of fine flour sulphur, one ounce of pulverized saltpeter, made into a soft ointment with fresh butter of fresh rendered hog's lard; rub in at night and wash out in the morning with warm water and soap; repeat three or four times. If the hair is scant from natural debility of the capillary organs, then simply use cold water applied with a soft sponge; avoid all combing or brushing, and clean the mane and tail as Arabs do, with a coarse flannel rubber.—Buffalo Live-Stock Journal.

Answers To Correspondents.

We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, trails, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.

Dr. G., Baltimore.—Where can I get artificial eyes for small birds? Ans. J. H. Batty, New Utrecht, L. I.

L. D. O., Philadelphia.—Two competitors will not be allowed to use the same rifle at the coming international match.

R. T. M., Nassau.—We do not know of any book describing the Grand Manan. Perhaps some of our readers will give us the information.

W. A. DOUGHERTY, Ohio.—Mr. Laverack's price is £30 for the dog you mention. It is necessary that you write as early as possible, as most of his setters are already promised.

E. C.—What would be the expense of such a canoe as you give a description of in the last issue of your paper, and where can it be obtained? Ans. The desired information may be found in FOREST AND STREAM, published March 26, under head of "Canoeing—Number Three."

L. W. G.—What books would you recommend an amateur fisherman to get, telling when and where to go, and what to use? Ans., Where to go—Hallock's "Fishing Tourist," Scott's "Fishing in American Waters." What to use—Roosevelt's "Game Fish of the North," Frank Forester's "Fish and Fishing," and Adams' "Field and Forest Rambles."

MYOSOTIS, Brooklyn.—There is no shooting anywhere in this State just now, except English snipe, and they only remain a few days. West Hampton, Riverhead, and the neighborhood of Smithville are excellent for duck, quail, and woodcock. The gun you mention is, we believe, a good one for the money.

BEN, Detroit.—Between the .40 and .44 calibres we give preference to the .44, for all round work, especially for long ranges. The Remington breech-loader we think highly of. See in No. 7, March 26th, result of some trials, which were very satisfactory. For the price we know of no more serviceable breech-loading fowling piece.

G. N., Baltimore.—Cleaning rifle is permitted under Wimbledon rules, in a match like the International, open to any rifle, although forbidden in matches restricted to breech-loaders alone. If, however, any annoy-

ance as to delay of match should issue, from men wasting too much time over cleaning, it might be very properly objected to.

W. E. PAYSON.—I expect to spend May or June in Washington Co., Maine. What flies and rods had I best take for trout during those months in brook and lake. Would it be worth while to take a light fowling piece? Ans. 1. See "Sea and River" column this week's FOREST AND STREAM. 2. No shooting in May and June. You ought to know that.

G. T. J. O.—Where can I get some quail eggs; I would like to get several dozen to hatch under a common hen, and then let them out on Long Island, as quail are very scarce in our woods. 2d. Where are there good snipe grounds, and how can I get there? Ans. 1. Write to T. M. Rodman, 696 Broadway. 2. All along the New Jersey and Long Island Atlantic coast.

W. I. FADDES, Minnesota.—Please inform me where in the United States caribou shoe packs may be obtained? Ans. Can't be gotten in the United States. We are arranging with parties in Canada to supply us, to enable us to fill the numerous orders we have for the same. We have this day ordered a case of beef-skin shoe-packs from Montreal for a dozen of our subscribers who want them, which we hope to receive in the course of a week. Use Indian (smoke) tanned caribou moccasins.

CARROL.—How great are the practical difficulties and embarrassments and general expense (in proportion to fares) of transporting an ordinary boat or canoe over the customary routes of sportsmen in their summer travels? Ans. There have been instances where, by making arrangements previously, canoes have been received as baggage, and transported free of charge. Shipping by express costs about as much as one fare, and by freight less than half as much, but the latter method is very slow.

J. H. P. C., New Haven, Conn.—The Wesson of the calibre and weight you mention is a serviceable gun. For general use would prefer the 44 to the 38. Both gages of gun would be equal at targets, but the heavier projectile better for hunting. In regard to the next gun mentioned by you, we know but little about it, except to hear it most favorably spoken of. The Remingtons make rifles costing \$32, \$34, \$35 and \$40, according to length. Their No. 2 model does not weigh quite 7½ pounds, and has open sights and nicely adjusted trigger.

EXCELSIOR, St. Louis.—Will you be good enough to let me know the price of the Laverack setters, the pups per pair; also a pair of dogs? Would Florida be a good place for a first-class hotel; by Florida, I mean some of the towns where sportsmen and visitors chiefly stop or pass through, and what would be the best town to start in and if it is a healthy country? Ans. Along the Indian and Hillsboro Rivers the country is very healthy, and several of our correspondents have spoken of the necessity for hotels there, affirming that the venture would prove remunerative, as the number of sportsmen there, this winter especially, is very large.

A. H. T.—Will you oblige a reader by answering the following questions: At what lake or lakes can good black bass and pickerel (or either) be found, together with hotel or boarding-house accommodations for a gent and his wife, &c.? 2. What rod would you recommend for trolling and still fishing for these fish? Ans. 1. Greenwood Lake, 12 miles from Turner's Station on Erie Railroad is a favorite summer resort. Turner's is 45 miles from New York. Crystal Lake, Dundaff, Susquehanna County, is another spot well spoken of. Canaan, Litchfield County, Conn., is a splendid place for pickerel and pike.

SPORTSMAN, Erie, Penn.—Snipe cannot lawfully be shot in this State between April 20th and September 1st, and this is something of a hardship upon sportsmen in the extreme western counties, and especially on the shore of Lake Erie, for, owing to the severity of our seasons, it is often as late as from the 10th to the 16th of April before the snipe make their appearance here, and thus a law framed for the southeastern part of the State, and that affords them their full measure of sport after snipe, nearly deprives us of all that enjoyment. Is it necessary to protect a migratory bird like the snipe at all? Ans. We think that protective laws for migratory birds accomplish little good in the spring, as the passage of wild fowl is swift, and they do not stop to feed by the way, as they do in the fall.

H., Philadelphia.—Is Climacoteague or Cobb's Island, the best place for bay snipe shooting? Ans. Cobb's Island. At what time in May are they most abundant? Ans. We never recommend the shooting of bay snipe until September. What grain of Curtis & Harvey's powder compares in size with Dupont No. 1 duck and Orange lightning No. 7? Ans. About No. 6.

J. J. M., Hamilton.—Thanks for attention in regard to rifle meeting, which you will find in to-day's issue. We give the size of targets as laid down in the reports of our N. R. A. for 1873. We expect the new report very shortly.

- The size of the targets shall be—
 - Up to 200 yards, 6 feet by two feet.
 - Over 200 to 300 yards, 6 feet square.
 - Over 300 to 600 yards, 6 feet by 12 feet.
 - At 400 yards, for volley firing, 6 feet by 12 feet.
- In competition for individual firing, the size of the bull's eyes and centres shall be—
 - Up to 300 yards, bull's eye, 8-inch square; centre, 2 feet.
 - Over 300 to 500 yards, bull's eye, 2 feet square; centre, 4 feet.
 - Over 500 to 1,000 yards, bull's eye, 3 feet square; centre, 6 feet.
 - 400 yards, volley, bull's eye, 2 feet high and extending across the target; centre, foot above and below bull's eye; outer, remainder of target.

LIEUT. E. O. H., San Francisco.—Having read the U. S. Ordnance Memoranda No. 15, and having seen the term used, "musket powder," you want to know what known grades of private makers can be compared with it for strength—size of grain, recoil, &c.? Ans. The Ordnance officer of the National Armory at Springfield has kindly given us the following data as the only record known to the department: 70 grains musket powder, with a 450 grain bullet, fired from a S. B. & R. M., cal. 50, model, 68, gave an initial velocity of 1,399 feet per second; 70 grains Hazard electric, as above, gave initial velocity of 1,377 feet per second. The Laflin & Rand Powder Company tell us that the FF cartridge powder made by them is musket powder, and so called by the Government when used by them. The importance of knowing exactly the differences of strength of powder is vital in shooting at long range, as our correspondent well knows. It happens sometimes at Creedmoor that a man gets on the target every time at 1,000 yards, while his neighbor cannot. Both are using the same weight of powder, shooting from the same guns, but the difference is in the powder. Sometimes careful practice will show the difference in the powder, and good results can be had by careful elevation or depression, as the case may determine, with various brands of powder. We will try shortly to give the subject a fuller development.

SEVERAL QUERISTS.—Various voluminous documents referring to the scrub race between the yachts Ariel and Storm King having been submitted to us, we append our decision. Space will not permit us to print all the papers and letters from the different judges and the gentlemen afterward elected to decide between them. But, as we understand the case, it was simply this: A scrub race was appointed for a certain day, and the use of oars absolutely forbidden, which was the only restriction imposed upon the competitors. The yachts got under way, Ariel soon taking the lead and keeping it throughout the entire race. On the way home it fell a flat calm, both vessels drifting towards the stake-boat. To avoid a steamboat, it is said, Ariel let go her anchor, getting it, however, before she had time to swing. Storm King claims race on technicality of Ariel having let go her anchor. Ans. The Ariel wins. The only definite restriction in the agreement between the yachts, was against the use of oars or sweeps, but we fail to see how letting go anchor under foot in a fair-going tide is to accelerate the speed of a yacht. So much for the special agreement governing the race. Under ordinary regulations the Ariel would still win, as the general ruling of clubs here and in England permits a yacht to anchor during a race, provided she gets her anchor again. And under general rules the Ariel would have another claim to the prize, from the fact of the Storm King having thrown ballast overboard.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

103 FULTON STREET, NEW YORK,
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, APRIL 2, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

REMOVAL.

The office of FOREST AND STREAM will be removed early in April to the Iron Building, No. 17 Chatham Street, lately occupied by the *Staats Zeitung* newspaper, which we have leased for a period of years. This splendid location in Printing House Square we shall occupy jointly with our popular daily contemporary, the *Evening Mail*.

THE CARP AS A FOOD FISH.

IT is not a little remarkable that among the various measures adopted by the United States for the multiplication of food fishes, so little attention has been paid to the carp, a species which has been cultivated for such purposes for many years in Europe, and which possesses the special advantage, not shared by such kinds as the black bass, the trout, etc., of being able to subsist entirely on vegetable food, and consequently capable of being crowded and reared in much narrower quarters than is possible with the other species mentioned. Any ditch or pond, however restricted, if provided with suitable aquatic plants, may be made the home of numbers of these fish, which, although not disdainful insects, worms and other animal matters, can get along very well without them.

In this connection we are glad to learn that a company is being formed in New York, having special reference to the rearing of this fish and supplying it to applicants, and that an experienced specialist is about visiting Germany for the purpose of bringing over the better varieties, of which there are several known to fanciers, some superior to others for such special purposes.

We shall be glad to learn from any of our correspondents to what extent the carp has been already introduced into the United States and where it is to be found. We have heard of no special efforts lately in regard to its multiplication, with the exception of a stock recently carried to San Francisco. There are indeed, traditions of the existence of carp in the Hudson River and elsewhere, as having descended from specimens which had escaped from fish ponds along its borders. This, however, remains to be better authenticated than it appears to be at present.

It is well known that the gold fish are extremely abundant in the Hudson, and as long ago as 1855 we accompanied a seining party in the mouth of Croton River at Sing Sing, on which occasion at least fifty bushels of fishes were taken, a large proportion of them good fish and used as

manure. Among these were certain large species which the fishermen called carp, on account of their olive color, and which may have been this species, but which at the time we were unable to distinguish from the gold fish by any other character; and indeed, among the largest specimens we found quite a number which were quite particolored, indicating that they were gold fish, or else hybrids between that and the carp. However this may have been, we shall be glad of any information that our readers may be able to give us.

It is well known that the gold fish under certain circumstances fails to put on its brilliant livery until at quite an advanced period of life; and should there be any question as to the character of particular species, it may be solved by transmitting the specimens to Prof. Baird, the United States Commissioner of Fish and Fisheries, at Washington. In this same connection we would invite any of our readers, who may at any time secure a strange fish that they are unable to identify, to make—as has already been done on more than one occasion by Messrs. Middleton, Carman and E. G. Blackford, of the Fulton Market, Mr. John Sutherland, of Liberty street, and others—a similar disposition of them. They may be forwarded in alcohol; or what is still better, properly packed in ice and saw dust, so as to arrive fresh. In this case they should be first wrapped well in cotton cloth, so as to prevent abrasion of the scales while on the journey. We understand that among his other plans as Fish Commissioner, Prof. Baird proposes to prepare an illustrated report upon the food fishes of the United States, and for which he will doubtless be happy to receive specimens at any time, as well as any information procurable in reference to the habits and migrations of the different species.

BERGH AND THE BIRDS.

WE have been requested to define our position as regards pigeon-shooting matches from traps, and to state if we are in favor of the practice. We accept the challenge. There is much—a great deal—to say against it. It is demoralizing to man's finer sensibilities, it is repugnant to his humanity, and it is the most expensive amusement to be had with shot gun or rifle. Abstractly, we do not regard it as more cruel than the taking of animal life by any other method of shooting. If the Society for the Prevention of Cruelty take cognizance of pigeon shooting, it cannot be excused from exercising a sweeping authority over all killings of beast, fish and fowl, when not necessary and with intent to procure food. As to fish, it certainly must be a more wanton torture to keep a salmon forty minutes on a line until he is done to death, than to shatter a poor pigeon's life out of it. Always, whether in the field, or in the stream, or at the trap, whether for pastime or for hunger, some creatures must escape wounded, and in suffering die. So long as man and the brute creation occupy the relations to each other of pursuer and pursued, so long will human laws prove futile to revoke the laws of nature; and while we may sicken, not only at the distress which, under the divine economy, besets and befalls all dumb creatures, as well as at man's more revolting "inhumanity to man," we must submit to what is foreordained. We can alleviate suffering, to be sure, and this it is our duty and the avowed mission of the Humane Societies to do. All honor to those who succeed in abating it one jot or iota!

But in all things, expediency, utility, and advantage are to be considered, and so long as the comfort of the brute creation must be subordinated to the necessities of man—so long as it is more important that our citizens should become expert in the use of arms than that the lives of thousands of pigeons should be saved, so long shall we defend the practice of trap-shooting. It secures quickness of trigger, accuracy of aim, confidence in the field, readiness for emergency, and renders our people the worthy descendants of ancestors whose training amid wilderness experiences and hand to hand encounter with wild beasts enabled them to conquer a country and win an independence. It was in such a school as this that our forefathers were tried; in this they learned the art of arms. Pigeon shooting we regard as essential to the defence of our country through the education of our citizens to be marksmen, and until some contrivance shall be invented or discovered which shall serve equally well in the manual of instruction, we must be content to permit and endure trap-shooting, repugnant as it may be to our finer natures.

THE UNIVERSITY BOAT RACE.—On the Thames, from Putney to Mortlake, a distance of four miles and two furlongs, sped the boats on Saturday last, and Cambridge, the light blue, came in ahead of Oxford by four boat lengths, having made the good time of 23 minutes, 35 seconds. Last year the time was 19 minutes, 35 seconds. The four minutes slower this year was caused by the water having been a trifle lumpy at the start. Cambridge has now won straight along for the last five years, having entered on the career of victory in 1870; before that the Oxforas had it all their own way, having started to win in 1861, and continuing through for nine years. Some quite unfortunate dinner question was the disturbing element this year. The Lord Mayor invited both crews to dine, Cambridge accepted, Oxford did not know whether to dine on Aldermanic turtle or not, and being slow in answering, received a rather sharp telegram from the Lord Mayor, and when they had made up their minds not to dine got a peculiarly curt letter from the Mayor, which is variously commented on. There might have been rudeness on the part of the University and pomposity on the part of the Municipality. For further details we refer our readers to our full account.

THE COMING INTERNATIONAL RIFLE MATCH.

IN our last the types made us say in regard to the coming International match, that it was open only to breech-loading rifles of bona fide American make, it should have read "any rifle breech-loader or muzzle-loaders," providing they were of American manufacture, under certain rules regulating their weight and pull of trigger. The programme published by us and the address of the Amateur Rifle Club to the Riflemen of the United States, explain this so clearly that there could have been no mistake in regard to it. We are having innumerable questions put to us on the subject of this International match, which seems to have awakened no small amount of interest. We are also the recipient of a great many letters from rifle manufacturers, mostly of muzzle-loaders, who all seem desirous of having their arms tested. There is no doubt but that many of them have guns of remarkable merit, but we would beg to state to them that it would be wise for them to look at some of the scores published by us of long range shooting before asking for public tests of their weapons. We shall however be only too glad to do all in our power to encourage their efforts, and intend to give a great deal of our time and no small amount of our pages to this subject of arms. We believe that there is a great deal of inventive talent laying aside, and that Creedmoor, the International match and the N. R. A. is certain to bring it out. Rifle ranges are not made alone for those who shoot, but especially to better develop this most important branch of manufactures by bringing into prominence the makers of arms. The programme and address of the Amateur Rifle Club is now printed for distribution, and the Secretary, Mr. F. P. Fairbanks, will furnish them on application to all parties who may require information on this subject.

HYDROPHOBIA.

WITHOUT being alarmists, or believing that rabies is on the increase, the late sad accident recorded by us has naturally awakened a great deal of interest in regard to this most fearful malady, hydrophobia. It may be stated pretty positively that although scientific men have studied the pathology of other diseases, and have in many cases isolated some particular venom or virus as fatal to human life, in regard to rabies and hydrophobia our acquaintance with them either in the animal or in the man is limited. We know of the terribly distinctive symptoms which attend the disease when we are stricken with it, but beyond that rabies is contagious our acquaintance with hydrophobia is scarcely more advanced than it was one hundred years ago.

In regard to the animal, we are sure that it attacks only the carnivora, and has never been known among the herbivora or omnivora. As to its origin, the author of "Rabies and Hydrophobia" states that fully ninety per cent. of the dogs attacked owed the disease to contagion and the remainder to spontaneous production. Climate has no influence on rabies, though we are inclined to think that it exists to a comparatively less degree in tropical climates. It seems pretty well established that there are more mad dogs in temperate zones than in the tropical or semi-tropical ones; more dogs inclined to run mad in the State of New York than in Louisiana. We are fast learning, too, that the season of the year has nothing to do with it, and that if dogs are to be muzzled in July they should be treated the same way in January. Treatment of dogs—as to food, starving them, or depriving them of water, or feeding them on decayed meat—have excited no particular influence. As to sex, it was supposed that the male dog was more prone to rabies, but this may be only apparent from the general fact that there are more male animals than females. Anger has nothing to do with it, as the cases of human beings bitten by dogs are innumerable where no bad effects have ensued. As to breed, and the tendency some peculiar races may have to spontaneously produce the disease, is still a disputed point. It has been affirmed on very good authority that mongrels are more frequently attacked by rabies than thoroughbred dogs or animals of pure strain. It is a perfectly well known fact that dogs and horses of good stock, on whose ancestors a great deal of pains had been taken to eliminate all defective qualities, have greater vital powers, and consequently are less prone to maladies. Without, then, asserting that mongrels are dangerous from being of mixed breeds, or arguing that more dogs of low degree are affected with rabies, because very probably more mongrels are bred than anything else, we most heartily endorse the advice given by the *New York Times* when it states that "the possibility of hydrophobia, however slight, is so terrible, and the peril incurred so entirely disproportionate to the pleasure derivable from the companionship of any beast, that too much care can hardly be exercised in selecting dogs for household companionship. Animals of pure breed ought in every case to be preferred, and mongrels resolutely tabooed. As we have said, the whole thing is a question of chances—infinities, perhaps, for people who do not keep dogs about; a trifle greater for those who have dogs of pure breed, still more pronounced for such as surround themselves with 'mongrels and curs' of low degree."

Some time ago we noticed in our English contemporary *Land and Water*, the statement made of the use of the acid nitrate of mercury in cases where horses and cows had been bitten by a mad dog, and that it had been successful in preventing disease. The proof seemed strong that the acid nitrate of mercury was useful, because when nitric

of silver (lunar caustic) had been used for the treatment of other animals, bitten by the same dog, at the same time, these animals had died of the disease.

Making further enquiry into this matter, trusting that any suggestions of ours might be of use, we begged information on this subject from Dr. Pancoast, of Philadelphia, and have been favored with the following reply:—

PHILADELPHIA, March 20, 1874.

EDITOR FOREST AND STREAM:—

In answer to your note which I have had the honor to receive, I would say that I coincide entirely in the preference you seem disposed to give to the use of the acid Nitrate of Mercury over Lunar Caustic as a prophylactic treatment against the bite of a rabid animal. Lunar caustic decomposes too quickly to make deep and penetrating impression. I have, however, a reference in practice to the use of chloride zinc in solution in various strengths—weak when I wish to inject into the bottom of a somewhat deep wound, and sometimes in full saturation in water in a more superficial injury, where I can apply it with a camel's hair pencil. Fortunately cases of hydrophobia in man are of rare occurrence, and few, if any, physicians have had sufficient experience in the treatment of such cases to render their opinions entitled to very strong consideration. I remain, yours very respectfully,

JOS. PANCOAST.

REPORT OF THE COMMISSIONERS OF FISHERIES OF THE STATE OF OHIO FOR 1873.

FISH Culture in Ohio will always be a subject of exceptional interest. From the particular geographical position of the State, bordering on an inland fresh water sea, and from her numerous rivers, combined with her agricultural wealth and intelligence, it is quite probable that in Ohio the system of State propagation and preservation of fresh water fish will be most fully tested. The report of 1873 gives us quite interesting data, the more so, as it presents to us the commencement of the work. Appointed in June 1873, when the spawning season was too far advanced to make the taking of the ova possible, the Fish Commissioners of the State may be said to have broken soil in virgin ground. The causes of the decrease of the fish first occupying their attention, this report commences by stating that since Ohio became a State some 17,000,000 of acres of forest land have been denuded of their timber, and that consequently the water in numerous brooks and streamlets, which once formed the spawning ground of the fish, no longer exist. Water sources, which forty years ago afforded motive power for grist and saw mills, are now sometimes dry for four months in the year. Such rivers then once full of fish, to-day have none in them. The erection of dams, making the ascent of the river impossible for the gravid fish, have added to deplete the streams. In the Scioto River, in days by gone, the buffalo fish (*Bubalichthys taurus*), the white perch, (*Pomoxys hexacanthus*), the pond perch, (*Micropterus megastoma*), were also abundant, but to-day, save in some few places, have almost disappeared. The Commissioners also note a peculiar fish the "spoon fish," (*Polyodon Spatula*), once found plentifully in some of the rivers of the State, as now entirely extinct. Save then the black bass, (*Grystes nigracans*), which has done well in the reservoirs, all the rest of the fish have suffered. Besides the causes already given as having destroyed the fish, Ohio being distinguished as a manufacturing State, the offal and waste from the factories poured into the rivers, have also had much to do with bringing about this dearth of fish. In studying this particular subject, as it has been our province to do lately, we cannot help but wonder sometimes how fish can live at all. After having had, as in Ohio, the water taken from them, or if supplied in quantity, poisoned by the refuse of manufactories, now the fish have to run the gantlet of snares and nets placed in their way in and out of season. The Ohio Commissioners complain that the laws are constantly violated, they therefore suggest that a law forbidding seining ought to be so modified as to limit it to the months when no spawning takes place. In Lake Erie, from indiscreet fishing, it seems that to-day the catch of fish is not one-twentieth of what it was twenty-five years ago. As to the rivers, the report affirms: "There is no State in the Union abounding in more or better streams for all kinds of fresh water fish than Ohio, and yet there is not a single State whose streams are so nearly destitute of fish. "It is proposed as soon as possible to remedy the evils by the erection of fish ladders and chutes on the rivers, and their being some very mistaken ideas in the State in regard to them, the Commissioners show how they may be constructed at very little expense, and with no damage to property, but they state that such helps would be of little avail as long as the seine and fish boxes and traps are in existence, which render the escape of a single fish something wonderful. It is proposed to erect a hatching house near Sandusky and another in the interior of the State, the former for collecting and maturing white fish ova, the latter for stocking the reservoirs, rivers and creeks of the interior with fish. It is recommended that the propagation of the following fish, to wit, the white fish, the black bass, the lake or white bass, and the yellow perch should occupy the attention of the Commissioners. Some of the facts given in regard to white fish are wonderful. In 1850 white fish were sold in Cleveland market at \$6 the barrel of 200 pounds, so abundant were they; since then, off Sandusky point, as much as eight tons of these fish have been taken at a single drawing; and during the last three years, the average tons of fish have been 4,257. The Commissioners are doubtful as to the possibility of introducing shad into the lakes and rivers, and do not deem it advisable to make the experiment just yet on account of its cost, though they express the desire to try the salmon and recommend some tributary of the Cuyahoga, near Akron, and other localities, as places where undoubtedly the salmon could be raised. There is no reason to suppose, says the

report, that trout cannot be raised in the State, and Mr. Hoyt of Castalia Springs, is mentioned, who has been eminently successful in producing trout. The report, under review, though treating rather of the initiatory work of the Commissioners, is excellent and practical in character, and as it is adorned with cuts of fish and gives a great deal of sound information in regard to the whole subject of obtaining the eggs of the fish, and of maturing them, we believe it to be a most useful compilation, which must tend to further the interests of the subject confided to the care of the Fish Commissioners of Ohio. The Commissioners for the State of Ohio are Messrs. John Hussey, John H. Klippart and Dr. E. T. Sterling.

Sporting News from Abroad.

WE may prate at home about our civil service and competitive examination for State appointments, but certainly in conservative England they have a summary way of doing things. Gladstone out and Disraeli in; Lord Cork, former Master of the Hunt, vanishes, and Lord Hardwicke, the new chief, now leads the Royal Staggers. For the only time during her long reign the first lady in Christendom, Queen Victoria, attended one day in the middle of last month a stag hunt, accompanied by the Duke and Duchess of Edinburgh; and the pretty Russian bride was introduced to what is certainly the finest assembly of hunting men, mounted on the most superb horses, to be found in the world. The Prince of Wales led gallantly in the van, and, if not in at the death, what is perhaps better saw Captain, the boxed up stag, safely landed among a herd of other stags, to which brotherhood he had fled. In honor of the event Captain is to be chased no more, and we therefore congratulate Captain on his good luck. Of course, her Majesty sat sedately in her carriage and saw the stag break, and heard the first whimper of the hounds. Some ambitious gentlemen came to grief. It frequently happens that these accidents occur to foreign gentlemen, who, in their zeal, describe eccentric parabolas out of their saddles. One must know something about the lay of the country when following the stag or fox. Considering all things, accidents of a fatal character are but very few. In *Land and Water* a correspondent, treating of a particular hunt, noted for its bold riding, says "that if the number of falls and injuries received by men riding four or five times a week to the hunt were reckoned up the average of accidents would be found wonderfully small," which goes to show that a man hunting is quite as safe as when walking in London streets or travelling in a railroad. It seems that but half the falls of hunting men are had at fences. Riding over rough country, and pumping out a horse who has neither stamina nor the necessary blood in him, and then urging him to do the impossible through ignorance of what work a horse can stand, ends sometimes fatally. It is not the most reckless riders who break their necks; it is the stupid ones.

—There are some curious figures brought to our notice about the licenses to shoot game in England. It seems that permissions to shoot have diminished since 1870. In 1870 66,911 licenses were taken out; in 1873 64,500. One thing strange about it is, that one of our English contemporaries thinks "that the plan of posting on the church doors lists of persons who have renewed their licenses seems to be a step in the right direction," and recommends "that those who are in default should be similarly posted." Different countries have different manners. Imagine with us—with some peculiar ideas of our own as to the reverence we feel for our places of worship—venues, or sheriff's notices, or tax assessments, stuck up on the village church door.

—We would particularly call the attention of our numerous French friends to what seems to be a very great cruelty exercised in Paris towards the dogs, which we find cited at length in the *Animal World*. In the Rue de la Pontain, in Paris, there is an establishment where the stray dogs of the city are incarcerated. Here animals are classed under two categories—those which seem of good breed and the mongrels. The former have some six days grace given them, and are fed; but the poor curs are only allowed three days' rations. Then, if not called for, all are starved to death. This is terribly cruel. The Parisian Society for the Protection of Animals are exerting themselves to change this barbarous method of destroying the dogs, and we feel certain that M. Chevalier, our most able and warm hearted confrère of the *Chasse Illustrée*, will do his best to aid in the suppression of this most iniquitous proceeding. Have they no Bergh in France?

—The accounts of the Trent Fish Board are most satisfactory in regard to the salmon. As many as 2,000 salmon, weighing 24,000 pounds, have already been taken, some fish weighing forty-three pounds. "Never in our memory," says Mr. Worthington, the honorable secretary, "has prime salmon in the month of February been so cheap." In Derby it has been sold retail at 1s. 6d. per pound; at Nottingham and other local towns 1s. 8d.

—If the Grace Eleven have lost some of their cricketing laurels in Australia, they seem of late to have been garnering no end of crowns. At Ballarat, when pitted against the Ballarat club of twenty-two, the Grace Eleven, or All England, made 470, W. J. Grace making 126, and G. F. Grace 112, the two champions earning between them rather more than one half of the whole score. The Australians scored 276, which is very good. Strong as are the Eleven in batting, wood having the odds by far against leather, critics declare the bowling of the English champions to be (not to put too fine a point on it) "poor." Think of it, yet

American lovers of the noblest of games, in far off Australia 20,000 people assembled to see the game.

—Death revolutionizes all things. We accumulate our books, our pictures, our *object d'art*, and on comes *pallida mors*, and our possessions are scattered to the winds, to be recollected again and again distributed. In the London *Sporting Gazette* we notice the advertisement of the sale of Baron Rothschild's famous stud, some fourteen two year olds, and some seven three year olds, all to be knocked down by the Messrs. Tattersalls under instructions from the executors. If a report we hear is true, which seems to us to be pretty well authenticated, one or more of these flyers are to be purchased by a gentleman who leads the turf in this city.

—Mr. W. B. Tegetmeier, of the *Field*, gives a most clever account of the gigantic octopus in Japanese waters, taken from a work called "Land and Sea Products," by Ki-Kone, who must be a naturalist of the most distinguished merit. The text is illustrated by two amusing wood cuts, which have that peculiar matter of fact treatment which render Japanese pictures so quaint and yet truthful. Before Mr. Harvey's most accurate description of the octopus, produced by the FOREST AND STREAM, with a picture of the tentacles of the *monstrum horrendum*, its existence was almost doubted. One of the Japanese pictures shows a boatman fighting with an octopus and lopping off his arms with a big knife. Mr. Harvey states boatmen in Newfoundland are pretty sure that the octopus in those waters have more than once laid violent hold of their crafts in the same way. In the second picture these material Japs have the octopus cut up into bits for sale at a fish stand, with groups of admiring spectators, pretty much the same as one sees at Mr. Blackford's, in Fulton market, when he shows his brook trout off in his aquarium to an admiring crowd. We are glad that our assertions in regard to the octopus' being edible are substantiated by our learned contemporary Ki-Kone, as one of our worthy correspondents, who had resided near Puget Sound, had informed us (as published by us) that when boiled it was like lobster. When one thinks that an octopus can be made into a *mayonnaise* this gastronomic fact deprives the ugly creature of all its terrors.

—Velocipedes are now a regular institution in Paris for sending messages between the *Bourse* and the telegraph office. They run the distance—about three and two-third miles and back—in twenty-five minutes. During the Bazaine trial they used to run between Paris and Versailles, some 12½ miles, in forty-five minutes. Of course this is very well in its way, and much as we should wish to see all sports of this character encouraged, the wonder is why don't they use the telegraph in France. Imagine the New York Stock Exchange wanting to communicate with the Western Union Telegraph Company by means of a velocipede.

"TEXAS JACK" AND THE EARL DUNRAVEN.—A fortnight ago we printed a letter from that redoubtable ranger, Mr. Omohundro, better known as "Texas Jack," accepting the challenge and entering the list against the Irish team in the coming international rifle match. How many times the favorite Springfield rifle which has served to spread his fame, has cracked the doom of Redskin or Grizzly, it would be difficult to tally, perhaps. But whatever emphasis it may have given to his prowess in days past, certain it is, that it will no more hang handy to his hand, or rest listlessly across his saddle bow. Some ten days since Jack parted with this old "Tujun-killer," and not without a pang, we trust, for it is hard to give up a tried and trusty friend that never fails in time of need. We can only imagine the kindly feeling that induced him to confide this friend to another, and we altogether envy the recipient of the gift, and that recipient is the Earl of Dunraven, to whom Jack has presented it. This old tool can now be seen at the emporium of Andrew Clerk, Esq., 48 Maiden Lane, in good order and ready for an emergency or a long campaign; for whatever its mere intrinsic value may be, the execution it has done in days bygone is sufficient guaranty of its excellence to any man who knows how to handle it.

That the Earl Dunraven knows how to appreciate this testimonial from one of America's sturdy frontiersmen, and that Jack has not mistaken the Earl's honorable manhood, is evidenced in his very handsome recognition thereof, for the Earl has graciously seen fit to acknowledge the same by authorizing Clerk & Co., to present to Texas Jack one of Dougall's very best ten bore shot guns, valued at £100 sterling, and which is now at their store in Maiden Lane. The Earl has requested Jack to call at Clerk's and receive the gun. Whatever Jack will find to do with it, is a puzzle, for chicken shooting must seem small game compared to knocking an Indian all into a heap at long range.

Earl Dunraven is now in England, but will return in about two months. During his recent visit to this country, he visited nearly all our hunting grounds, from Oregon to Florida.

A MOST SEASONABLE BOOK.—Hallock's "Fishing Tourist," published by the Harpers' and advertised in our journal this week is a book that all anglers should have. It is a complete general guide and directory to all the fishing localities of United States and Canada, and is the only work of its kind in the country. It is endorsed by the Canadian and English press as an accurate and serviceable work.

CLOSE SEASONS FOR GAME.—We print this week a revised table of Close Seasons, several alterations becoming necessary by recent legislative amendments to State laws

Natural History.

PERPLEXITY ARISING FROM LOCAL NAMES OF FISH.

I AM frequently amused as well as perplexed, as no doubt others are, at the various names for the same fish, and am reminded of it in this instance by Dr. Estes' interesting account of taking the pike perch in Lake Pepin. The Doctor gives it its true appellation, as its generic name, *Lucipio perca*, indicates. This scaly fellow (not the Doctor but the fish) is written or spoken of as the goggle-eyed pike of Lake Superior. In the more southerly of the great lakes it is the wall-eyed pike. In Lake Champlain it is the pike, in contradistinction to the pickerel. It is the Ohio salmon and Susquehanna salmon. In the former river it is sometimes called the jack-salmon. It is the Botetourt chub in south western Virginia; and in the lakelets on the Arkansas side of the Mississippi it is known by our short haired brethren of the rod and net who sell them in the Memphis market, by the euphonious name of bullet-eye chub. You see, Mr. Editor, this fellow has as many aliases as a pick-pocket or a bank burglar, and to many a reader or listener, called by a different name, he is supposed to be a different individual, when he is really the same voracious, mysterious, ubiquitous person. The only way to detect and identify him in his ubiquitousness and under his many local names is to refer him to his proper family and genus as described by some such musty old ichthyologist as Theodore Gill or E. D. Cope.

There is another, a smaller and more comely "chap," and which by the by should become a naturalized citizen of appropriate waters of the Eastern and Middle States; I refer to *Pomoxis hexacanthus* of Cuvier. There is no know-what new scientific name Prof. Gill has given him of late. I here give you his full length portrait taken in New Orleans fifteen years ago.

Isn't he a handsome little fellow? He is not known in the Eastern and Middle States, nor until you meet with him in the waters of South Carolina, where he is sometimes called "chub." You find him along the South Atlantic and the Gulf States, still with an alias. At New Orleans he is known by the Creoles as *Sac-a-lai*, by the English speaking inhabitants as chinkapin-perch. The old French habitants about St Louis dubbed him crappie, and higher towards the lakes as well as in Ohio, he is called the grass bass. In all this wide range of habitat he differs somewhat in color and markings.

As you well know, our Potomac bass is known as the "James River chub." In the South and South West as "trout." The red and yellow bellied perch with larger mouth than the "sunny," a species of *Centrarchus*, is known in the South as the bream, which is an English species of the carp family, a peaceable non-predatory fish; the two being really about as dissimilar as Charles Hallock and

THADDEUS NORRIS.

A GOOSE QUESTION.

HONEOYE FALLS, March 12th 1874.

EDITOR FOREST AND STREAM:—

I have a desire to possess a pair of all the different wild geese that ever flew over this continent. I have the common, *Anser Canadensis*. A correspondent near the North Pole offers me the snow goose, and the white fronted goose, what are they? and what is "Hutchins goose," where found &c.? Then if I get these four birds and the Brant or Barnacle goose, have I all the American geese that are known? Will you give description and tell us all about them?

AN HONK.

Ans.—The snow goose is a small white species with a pale bluish coloring on the upper parts. The ends of the primaries are black. It has a short strong heavy bill furnished with a strong thick nail at the extremity of the upper mandible. The snow geese feed principally on vegetable matter and are very good eating. They are not widely distributed over North America, but are not found abundantly in any particular locality unless it be at their breeding grounds far to the North.

The white fronted goose is more common than the species above mentioned, though it cannot be called abundant. It is found on the western prairies and is called "prairie brant," by marketmen and gunners. In size it is about half-way between the brant and Canada goose. It has a strong heavy bill deeply toothed with a strong white nail at the end of the upper mandible. There is a long patch of white that runs on the sides and top of the base of the upper mandible; tail brownish black tipped with white; upper parts blackish brown. In winter breast coarsely mottled with black and white. In some individuals the mottling runs nearly to the vent. We have seen several exposed for sale.

The Hutchins goose looks very much like a diminutive Canada goose, and is found on the northern and western coasts of North America. Stragglers have been taken on the north eastern coast.

The brant is a numerous species and can be taken along our coast (in winter) from Florida to Boston. They feed chiefly on vegetable food, and when domesticated eat rye and wheat greedily. Their natural food is the sea lettuce, a marine plant common in all our bays. They never dive when feeding, but resort to the flats at low tide, where they reach their favorite food by running their neck down to the bottom from the surface of the water. They will subsist on grass, and will crook their necks and pluck it like tame geese. When in captivity they require an abundance of sand, as they eat large quantities of it from their favorite sand bars when in a wild state.

The Bernicle goose is exceedingly rare in North America. It has been a mooted question whether it properly belonged to the fauna of North America. It can probably be obtained in Europe. It looks somewhat like the Hutchins' goose, having a small head marked with white spots.

There are two other species you have not mentioned, *vs.* white headed goose, and the black brant. The white headed variety is distributed over the whole of North America. Stragglers are sometimes found in our city markets, a taxidermist found one in Washington Market last week. This variety is probably the immature bird of the snow goose. It is a pretty goose and is well worth domesticating. It has the head and part of the neck white, finely and thickly mottled with rusty brown; upper parts brownish black; rump and wing coverts blueish white; lower part of the neck, breast, and belly, brownish black with feathers edged and tipped with white; legs short, strong and of a reddish color.

The black brant is a trifle smaller than our common eastern species, its plumage is much darker and it is found on the Pacific coast. It breeds in the Arctic seas, where it is common.

We would strongly advise you to get the snow goose, white headed, and white fronted geese, if possible, and watch their different plumages, and see if they are not one and the same species, as suspected by ornithologists.—[E.D.]

A CHARMED BIRD.

BOSTON, MASS.

EDITOR FOREST AND STREAM:—

A friend of mine living in Fitchburg with whom I often hunt, is the owner of a fine setter. One day while working a small cover, as we came near the border, the dog suddenly pointed, my friend advanced slowly to the dog, but no bird flushed, but on stooping he discovered under the shrubbery within four feet of the dogs nose a cock partridge, who stood looking the dog steadily in the face. Taking his gun in the left hand he stepped past the dog and caught the bird in his hand before she moved.

Do your readers often hear of such incidents?
MESSENGER.

EDITOR FOREST AND STREAM:—

The following circumstance seems to denote the existence of something more than instinct in an animal, and has to the best of my knowledge, never before been published. Its truthfulness I am prepared to attest.

One morning a pair of swallows were noticed busily engaged in building a nest in the upper corner of a window of an old house. They seemed to be in great haste to get their nest finished, and that they were so was evinced by the fact, that in the evening the nest, which was more than half built up, fell to the ground, doubtless owing to the insufficient working of the mud employed in its construction.

The next morning on approaching the old house, a loud twittering was heard, and a number of swallows were seen flying about the place where the nest had been. There were some forty in all and they were continually flying between the nest and a neighboring puddle. By night the nest was finished, and next morning there was an egg in it. The female swallow must have communicated to the others her immediate need of a nest and thus enlisted their aid, at least so thinks
TRANSIT.

NICASIO, March 12th, 1874.

EDITOR FOREST AND STREAM:—

An albino robin was shot by Mr. John Lucas, on Sunday last at his ranch, four miles from San Rafael, which he kindly presented to me, as I sometimes mount birds. This specimen was a male in good plumage, the back wings and tail white; head and neck slate color; throat and breast mottled white and light red; beak and legs white; eyes black; the ends of the wings and tail have a worn appearance. The robin does not breed in this part of the State, but only spends its winters here.
PIONEER.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, }
NEW YORK, March 28, 1874.

Animals received at Central Park Menagerie, for the week ending March 27, 1874:

Two golden checked Cougars, *Canis auratus*. Hab. Panama. Received in exchange.

One Gray Fox, *Vulpes virginianus*. Presented by Mr. Henry Clark.

One Gray Squirrel, *Sciurus ca. olivaceus*. Presented by Mrs. Charles Donahue.
W. A. CONKLIN.

RATTLESNAKES. A QUERY.

U. S. NATIONAL MUSEUM,
WASHINGTON, D. C., March 17, 1874.

EDITOR FOREST AND STREAM:—

We sometimes hear the most extravagant stories about the size of rattlesnakes and the number of rings which they carry in their rattles. For instance, a rattlesnake is said to have been killed last July near Knoxville, Tenn., which weighed one hundred and seventeen pounds, and had eighty-seven rings on its tail. Now, we can make great allowances for a large story, when it is indefinite, but this is too exact in its statements to be in the least credible. I doubt not that many of your readers have seen large snakes, and that it would be interesting to compare notes. The largest in the U. S. National Museum measures six feet two inches in length and carries twenty rings and a button. I know of a rattle taken in the Cumberland Mountains, Tennessee, and now in the possession of a young lady in Knoxville, which has twenty-six rings and a button. Both of these specimens are probably of the common yellow species (*Candisna confluenta*); the rattlesnake of the western plains (*Candisna confluenta*) is frequently found with fifteen or sixteen rings in its rattle.
G. BROWN GOODE.

GRAFTON, Vermont, March 23, 1874.

EDITOR FOREST AND STREAM:—

I take the following from my journal of a fishing excursion to Bowen & Stratton Ponds, near the top of the Green Mountains. It may interest some of your naturalist friends. We should be pleased to hear from Mr. Batty on the subject.

"August 23d, 1873, S. B. P. and C. B. left camp early this morning to look after our horses at Rootville. On their return they strolled on to Stratton Pond. Up Sucker Brook they went a few rods for good water, and seated on the bank, about five feet from the brook, and from eight-teen to twenty inches above it, took their lunch. S. B. indulged in his usual habit of turning over sticks, stones and everything within his reach, under one of which, a decayed piece of wood, he found a "What is it?" a large number of eggs. They discussed the question, but could arrive at no satisfactory conclusion, and packed a part of them in moss and brought them to camp. When your correspondent saw them, an hour afterward, they were perfectly fresh, and appeared like so many trout (*salmo fontinalis*) ova, when first taken from the female fish before impregnation. What they were, or how they came in such a position, we are unable to say; the piece of wood had not apparently been recently moved. There were no tracks leading to or from it, nor was there any observable communication under it to the cavity containing the ova. There are numberless everts or water lizards in the pond. Could their origin be attributed to them? We are not acquainted with their habits. If left by them more than one animal must have deposited them, as their bulk was much more than one of these animals. Yours truly,
S. W. G."

NEW YORK, March 26, 1874.

EDITOR FOREST AND STREAM:—

In your valuable paper of to-day's issue I notice your correspondent (C. F. S.) seems in the dark concerning the eggs of the common Yellow bird (*Chrysomitris tristis*). Having devoted my spare time to ornithology for years past, during which I have collected numerous eggs of the species in question, I have invariably found them to be of a pale, bluish-white color, entirely unspotted, almost globular in shape. May they not have been heretofore confounded with those of the yellow warbler (*Dendroica aestiva*), whom they somewhat resemble, and whose egg would answer to his description? Yours truly,
R. F. P.

The Kennel.

GUN SHY SETTERS AND POINTERS AND A PRACTICAL METHOD TO OBVIATE AND REMEDY THE FAULT.

EDITOR FOREST AND STREAM:—

It is sorely discouraging to the sportsman, after purchasing a setter or pointer puppy, apparently well bred and of good points and successfully bringing him through the many ills the young dog is heir to, to find his pupil gun shy, where that portion of his education, when the gun is used, is reached; so shy that nothing can be done with him until the object of his fear is placed out of sight. In ninety-nine times out of a hundred this fault is hereditary, and even though sire and dam, grand sire and grand dam did not possess the weakness it is but the cropping out of the taint of some remote ancestor.

How often we see animals of known good blood destroyed, because they are wrongly pronounced irrecoverably gun shy, when, by a careful treatment and one might say a reasoning with the dog, the fault could be remedied.

When my youngster had reached the age of four or five months, I would never feed him without directly before discharging a pistol or gun, beginning first with light charges, increasing the loads when he began to associate the report with the pleasure of satisfying his hunger. I am convinced, when I became ready to teach him, dropping to shot or coming in to shot, the sight of the gun would be a pleasure rather than the adverse.

Again, I should not fear to attempt to correct this shyness in an old dog in like manner, keeping him always with a keen appetite for his meals, and striving to show the coward that the gun would not injure him and to associate its report with some pleasure.
"HOMO."

THE DEATH OF "MUSIC."—In our issue of last week we gave an account, through the courtesy of our correspondent, Dr. Jacob Wagner, of Lynchburg, of the death of one of the most renowned foxhounds in Virginia, "Music." We now lay before our readers the estimation this hound was held in by her owner, Captain McDaniel:—

"She was a tried associate in whom I had the utmost confidence. She never uttered a falsehood or did a mean act. She was as true as steel, and perfectly honorable in all her actions. She never entered a dwelling unless it was on a good morning for a fox-chase; then she would come in and lick my hand to remind me of the fact. She always led the chase, and took more red foxes than any dog of her age—seven years. She was never beaten fairly but by one dog, and that was her daughter and namesake, owned by Mr. Hiram Cheatwood, of the same neighborhood. She has been known to run from nine o'clock, A. M., of one day until five o'clock of the following day, keeping the lead constantly. One of her great exploits was the capture of a famous red fox—Old Liz—which had for years defied all the hounds in the country, after a chase of only forty-five minutes. She was buried in a respectable manner."

BLUE BELTONS.—We understand from our Philadelphia correspondent, who, by the by, for a young man, has had as much experience in amateur rearing and breeding of young dogs as anybody in the country, and moreover, is a true sportsman and practical naturalist, that Mr. Horace Smith, of Philadelphia, has a new imported Blue Belton setter. "Homo" says: "I never saw in my life a more beautiful animal, he is broken admirably in the field, but is not for sale, as he will be used as a stock dog." In speaking of Mr. Smith, our valued contributor says: "this gentleman has bred and sold dogs for fifty years, and is noted for being one of the most reliable men in the country." We can confidently recommend field sportsmen who are in search of well broken and staunch setters to correspond with Mr. Smith.

Shot Gun and Rifle.

GAME IN SEASON FOR APRIL.

Wild fowl, snipe and geese to April 15th. The remainder of the month is a close season.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

—On Thursday of last week Messrs. A. C. Lawrence, Peter Lynne, and party, accompanied by two brace of setters, started for Virginia to shoot English snipe. We now have the pleasure of seeing evidence of his field ability, and to thank Mr. Lawrence for his very handsome present of fifteen brace of English snipe which are now getting quite rare. This cautious and thorough field sportsman must have found out some splendid feeding grounds, as the birds are plump, and arrived in most excellent condition. Where is't? Won't you tell us, Lawrence? One of the cock birds we shall have stuffed as it is of extra size and weight, and will make a handsome addition to our collection.

—The Illinois State Sportsmen's Association, recently organized for the protection of game in that State, is calculated to accomplish a vast amount of good. We would like to see its example followed in other States where such associations do not now exist. There is nothing like co-operative effort, and where all the various clubs of any State are or become subsidiary to one central organization, much effective power can be wielded in the enforcement of laws and penalties, and the securing of intelligent legislation upon all matters relating to the protection and propagation of game and fish. The officers of the Illinois State Association, recently elected, are, President—John V. LeMoine, of Chicago; Vice President—W. T. Johnson, of Chicago; Second Vice President—John L. Pratt, of Sycamore; Secretary—Luther E. Shinn, of Chicago; Treasurer—C. B. Miller, of Genesee.

Its first annual meeting will be held in Chicago on the first Tuesday of next June, at which time a pigeon shooting tournament will be held.

—The Germantown Telegraph says:—

"Usually very good snipe shooting can be had at this season on the meadows near Woodbury, and also on the marshes a mile or two this side of Chester. The English snipe is sometimes found in moderate numbers along the low ground on Pensaucon and Timber creeks. The best shooting, however, within a few hours ride of this city, can be had at Port-Penn, Delaware, and Salem, New Jersey. There the meadows are very extensive and the birds not so much disturbed."

THE NEW SHARPE'S SIGHT.—Passing through Hartford, a representative of the FOREST AND STREAM was glad to avail himself of the politeness of Mr. G. W. Yale, Superintendent of the Sharpe's Rifle Manufacturing Co., to try their new improved system of sighting applied to their rifles. The mechanism was of the simplest character, though of exceeding delicacy, allowing the riflemen to move the back sight, to the most minute fractions of an inch. The peep sight is used. In front of the rifle, there is also a most carefully adjusted sight, permitting the foresight to be moved to the right or left, so as to allow for influences of drift or wind. The mechanical portions seemed to be careful in every detail, and are likely to produce the best results. It has been before asserted by the FOREST AND STREAM that we knew of but little of improvement to be made generally in the construction of the gun itself, but stress was laid on the fact, that shooting at long ranges, what was required was the most careful sighting, and that a mechanism was wanted which would be capable of being adjusted to the fractional parts of inches, both in the back and front of the arm. The shooting made by our representative at Hartford was guided by Mr. Yale, who explained in detail the working of the Sharpe rifle, and the facility of adjustment was practically demonstrated in shooting at various ranges. We suppose the necessary elevation or depression of the rifles manufactured by all our leading makers are at present pretty well understood, with the weight of projectile and charge of powder required for all ranges, but we are inclined to think that questions of drift, effects of temperature, of light and shade, and of the disturbances of wind, quite vital to long range shooting, require as yet no end of patient toil, trouble, and experiment. What is certain is, that the Sharpe Rifle Co. have spared no labor or expense to give their justly celebrated arm a most effective and excellent sight.

WEIGHT OF POWDER.—Many of our correspondents ask to give them a proper standard for measuring powder. We are indebted to Mr. P. G. Sandford, the expert in the late gun trial, for the following weights which have been arrived at with a great deal of care:—

The measured drachm of powder weighs 27 11-32 grains, Troy.

The measured ounce of powder weighs 437 1/2 grains, Troy, or 16 drachms.

The measured pound of powder weighs 7,000 grains, or 256 drachms of 27 11-32 grains, Troy, each.

Our riflemen may find this gauge of weights useful in making up their cartridges to a nicety, as will our pigeon shooters or those testing guns.

—Last January some gentlemen placed 250 quail in Harford County, Maryland, about ten miles from Havre de Grace. A fortnight ago they were all doing well, but had not paired yet.

—Some time ago the N. O. Times, noticed some very clever shooting at 600 feet, with eighteen pound rifles, shot off hand, where three contestants, Messrs. Wintter, Shipley and Pfluckhahn all made good shooting. The Mobile Register of last week states that the Mobile Rifle Club have quite as efficient marksmen as can be found in Louisiana. We quote as follows:—

Last summer Col. J. M. Williams, shooting 200 yards, off hand, with a Remington breech-loader, cal. 42, succeeded in hitting the centre three shots out of five. For the benefit of the uninitiated, we explain that the centre, or "25" spot on a 25 ring target, is one half inch in diameter. Another member of the Mobile Club, since deceased, with a Smith & Wesson rifle, cal. 32, off hand, 200 yards, made two 25s and one 22 in five shots; the 22 is 1 1/2 inches from the centre. The writer was present on both occasions, and took the score as the shots were made. Of course there was some luck in this shoot; neither party expected to ever make such a score again. Neither gun had a hair trigger, though both had globe and peep sights.

If Col. Williams will only try his Remington at 800, 900 and 1,000 yards and report his shooting to the Amateur Rifle Club of this City, providing he can do anything like as well as at 200 yards, he would be just the man wanted to make one of our home team who are to enter against the Irish team at Creedmoor this coming September.

—Ira A. Paine of this city, and James Ward of Toronto, Canada, shot a match at pigeons at Woodside Park, near Stamford, Conn., on March 25th. The conditions of the contest on that day were as follows:—Each to shoot at 100 birds, fifty single birds twenty-one yards rise, from H and T traps, Rhode Island rules, and twenty-five double birds, eighteen yards rise, from steel plunge traps, Forester Club of Buffalo rules, the one killing the most out of a hundred to win, for \$500 a side and the championship of America, Paine to bring the birds on the ground in two baskets, and Ward to name what basket was to be shot from first. The following is the score:—

SINGLE BIRDS.

James Ward—1 0 1 1 1, 1 1 1 1 1, 1 1 1 1 0, 0 1 1 1 1, 1 1 1 1 1, 1 1 1 1 1, 1 1 1 1 1, 1 1 1 1 1, 1 0 1 0 1, 1 1 1 1 1. Total, 50; killed 45; missed, 5.

Ira A. Paine—1 0 0 1 1, 1 1 0 1 1, 1 1 1 1 1, 1 1 1 1 1, 1 1 1 1 1, 1 1 1 1 1, 1 1 1 1 1, 1 1 1 1 1, 0 1 0 1 0, 1 1 0 1 0. Total, 50; killed, 43; missed, 7.

DOUBLE BIRDS.

Ira A. Paine—1 0 1 1 1, 1 0 1 1, 1 1, 1 0, 1 0, 1 0, 1 1, 1 1, 1 0, 1 1, 1 0 1 0, 1 1, 1 1, 1 0, 1 0, 0 1. Total, 25 pairs; killed, 38; missed 12.

James Ward—0 1, 1 1, 1 1, 0 1, 0 1, 1 0, 0 1, 0 1, 0 1, 0 0, 1 0, 1 1, 0 0, 1 1, 1 1, 1 1, 0 0, 1 1, 1 1, 1 1, 1 1, 1 1, 0 0, 1 1. Total, 25 pairs; killed, 33; missed, 17.

Ira A. Paine killed 81, shot 37 straight birds, missed 19. James Ward killed 78, shot 26 straight birds, missed 21. Referee—Oliver Johnson, Providence, R. I.; Judge for Paine—Ernest Staples, New York.; Judge for Ward—Henry Miller, Toronto.

WICHITA, KANSAS, March 24, 1874.

EDITOR FOREST AND STREAM:—

Please find score of a sweepstake pigeon match that came off yesterday, the 23d. There were eight entries, ten birds each, New York Club rules to govern, 21 yards rise, 30 yards boundary, 1 1/2 oz. shot, entrance fee \$10, divided in three prizes. Dr. McAdams was chosen referee. The score is as follows:

Rosenburg—1 1 1 0 1 0 1 1 0 0. Total, 6.

Ramage—0 1 1 1 1 1 1 1 1 1. Total, 9.

Tucker—0 1 0 1 0 1 0 0 1 1. Total, 5.

McCulloch—0 0 1 0 1 0 1 0 1 0. Total, 4.

Brocket—1 1 1 0 0 0 1 0 1 0. Total, 5.

Doyle—1 0 1 0 1 1 1 1 0 0. Total, 6.

Mathews—1 1 1 0 1 0 0 0 1 1. Total, 6.

Henderson—1 1 1 1 1 1 1 1 0 0. Total, 8.

Rosenburg, Doyle and Mathews tied on third prize; shot off; the first miss out, resulting in Doyle winning, killing four birds and out-shooting his opponents. Ramage, first prize; Henderson, second; Doyle, third. Yours truly, Mc.

HAMILTON, Canada, March 24, 1874.

EDITOR FOREST AND STREAM:—

I send you an account of a meeting of riflemen held on the 17th ult., at the Temperance Hall:

The meeting was called for the purpose of founding a rifle association on such liberal principles as would allow the membership of Tiers of all classes of rifles, namely, those with open sights, and such other finer arms as are permitted at the Wimbledon competitions. Lieut. Col. Scoble was in the chair, Mr. W. Cruik acted as secretary. A draft of the constitution of the new club was presented for consideration. The first debate was in regard to the name of the association, and after considerable discussion it was decided that the club should be known as the Ontario Any Rifle Association. The remaining clauses of the constitution resemble those of any other similar association very closely. The annual subscription is \$2; donors of \$20, and persons presenting a prize worth \$40 are to be honorary life members. The election of officers resulted as follows: Captain Mason, of Hamilton, president; Mr. W. M. Cooper, of Toronto, 1st vice president; Major Cotton, of Kingston, 2d vice-president; Captain A. A. McDonald, of Guelph, 3d vice-president; Mr. T. W. Marsh, secretary and treasurer. The council are Mr. George Disher, of St. Catharines; Captain McNoughton, of Coburg; Mr. A. Bell, of Toronto; Ens. Adam, of Hamilton; Ens. Wastie, of London; Captain Barber, of Ottawa; W. Clute, Captain Gibson and W. Stanley, of Toronto.

It was proposed by Major Cotton and seconded by Ens. Adam, that a challenge should be sent to the Irish team, on their arrival in New York—carried.

CINCINNATI, March 15, 1874.

EDITOR FOREST AND STREAM:—

Some five weeks ago a sporting club—the "Cuvier"—was organized in this city, and now has 160 active members. "The object of this club," says its constitution, "shall be to preserve, protect and increase the game and fish of Ohio; to enforce the laws of the State concerning them, and to promote and advance field sports." A committee from the club was sent to Columbus to defeat, if possible, the Kemp bill, an extract from which I see has been sent to you by your correspondent at Akron. The bill was made a special order for last Monday, but was not called up, the author probably fearing that it would be defeated. Mr. Potter, a member of the Senate, introduced a bill which was far more objectionable than the Kemp bill. When it was called up in the Senate it was defeated. Mr. Potter himself voted against it. There is a strong feeling throughout our community in favor of calling State and National conventions to frame and influence legislation in the interests of science and of sport.

RETLAW.

EDITOR FOREST AND STREAM:—

The Octoraro Sportsmen's Club, composed of gents of Lancaster and Chester Counties, Penn., was fully organized on the 23d inst. with the following officers: President, Mr. Wm. McElwain; Vice President, Hon. Jos. D. Pownall; Recording Secretary, Mr. Lemuel W. Dobbins; Assistant Recording Secretary, Mr. Wm. W. Martin; Corresponding Secretary, Dr. J. Willis Houston, Collamer, Chester County, Penn.; Treasurer, Mr. Levi Pownall; Executive Committee—Chairman, Mr. George Pownall, Post Office Christianson, Lancaster County, Penn., Mr. Jesse Brosins, Mr. John F. Reed, Mr. Henry Nozzle, Mr. Harry Davis, Mr. Josiah Beyer. The objects of the club are similar to those of like organizations, among which are prominent the protection of game fish, &c., as well as the study of the natural history of animals. The territory over which the membership extends will include from 75 to 100 square miles, and the club is composed of gents of high social standing, who will most rigidly enforce all our existing game and fish laws, and their influence will be a power in shaping our future legislation upon this subject. Yours, &c., GROUSE.

Sea and River Fishing.

FISH IN SEASON IN APRIL.

Salmon, *Salmo Salar*. Salmon trout, *Salmo conflinis*. Trout, *Salmo fontinalis*. Shad, *Alosa*. Land-locked Salmon, *Salmo gloveri*.

—To-day, the beginning of April, we run up our anglers' bulletin for the season. Naturally, the shooting days are over until the July woodcock come, and the gunner might as well content himself to lay aside his game bag and breech loader for three months, and devote himself awhile to the gentle art of fly-fishing. The season is already well advanced, and much earlier than usual. Navigation has been resumed on the great lakes, and the snow has disappeared from the interior, though a little still lingers among the Adirondaeks and the knobs of Pennsylvania. We may look for clear streams by the middle of the month. It is unsatisfactory to test the streams while they are tainted with snow water.

The angler has now a full fortnight to overhaul his tackle and prepare his outfit. See that your rod, line, flies, and reel are in perfect order. Test your line foot by foot for frays and weak spots. See that the ferules, rings and eyes of your rods are tight, and no fractures in the joints. Above all, look well to your flies; reject all specimens that have been injured by use, and all frayed gut lengths. It is better to throw away a handful now, than to lose flies and heavy fish together the first time you fasten to a rise. If your outfit is not complete, nor your assortment of flies full, replenish at the tackle shops. A dozen of the very best makers advertise in our columns. Get a click reel two inches in diameter that will hold twenty-five yards of line. We prefer linen waterproof laid lines, though some choose silk, or a tapered braid of silk and hair. The objection to the latter is that the minute ends of hair fray by wear, and prevent the line rendering freely through the rings of the rod. Silk does not render as freely as a linen line that has been used two or three times. Now, as to rods, taboo those ingenious contrivances for convenience—the "trunk rods"—rods made of four or five lengths so that one can carry them in a trunk—rods stiffened with a multiplicity of ferules, and suited to all kinds of fishing, from a minnow to a masealonge. They are fit only for those who wish to still-fish with a worm and a pin. As to weight and elasticity of rod, we would prefer to put a fine delicate implement even into the hands of a novice, rather than a ponderous stiff affair—that is, if the novice can afford to break a half dozen per season until he has learned his art. One thing is certain, no one can become an expert fly fisher by practice with a bean pole or wattle, no more than he can play at battledore with a two pound weight. As to what a perfect rod should be, we prefer to quote from Hallock's Fishing Tourist, and as we are the author of these lines we cannot be accused of appropriating another one's own.

"The creation of a perfect arch is the true philosophy of rod manufacture, just as the management of this arch in motion is the essence of scientific angling. The elastic properties of a rod should be evenly distributed and maintained throughout its length from tip to butt, so that when the rod is bent, no variation from a perfect arch can be detected. Metal ferules, being stiff and unyielding, interfere with the proper formation and play of the arch; hence manufacturers have sought to obviate the difficulty by making their rods of three or even two joints instead of four, as formerly. Some have connected the middle joint and tip by a splice, while others dispense with the ferrule altogether. * * Uniform elasticity being secured, the second requisite is stiffness—that peculiar power or force which, combined with the elastic properties of the wood, produces a certain yielding resistance which prevents the fish from exerting his full strength on the hook, the leader, or the line; for from the moment a fish is hooked until he is landed the arch of the rod, either longer or shorter, should be persistently maintained; the fish should be killed on the rod, not on the line. A horse cannot exert his strength to advantage with elastic traces; neither can a salmon overcome that mysterious force which, ever yielding, never breaks. The third requisite of a perfect rod is lightness."

In this latter respect, as indicated above, the split bamboo rod especially excels, and for an implement that combines all the qualities mentioned, the six-splice bamboo has no equal. Next in desirability, (we speak for ourselves, only, and we don't charge anything for the opinion,) is a rod of ash but and lance wood tip and middle joint, though some prefer the middle joint of ash, as it is lighter. The length of a trout rod should not be over 12 ft.; of a salmon-rod not over 18 ft. We shall make this matter of rods a subject of frequent reference. Indeed, we intend to give in successive numbers complete instructions in the selection of tackle, and in angling for fish of various kinds.

As to selections of flies adapted to different months and different waters, we have no end of inquiries; and at the

risk of being challenged by some nice critics, we herewith give a few casts:—

For April.—Blue dun, cow dung, and the pale green dun, which changes to a light red spinner, and little May dun.

May.—Little May dun, cow dung, and red spinner for first cast—to change to dusky brown, ibis and yellow spinner.

June.—Little May dun, American professor, and green drake. 2d, cow dung, yellow sally, and the uncertain shades of dusky brown.

July.—Stone fly, green drake, and blue bottle.

August.—Yellow sally, iron blue dun, jenny spinner or August dun, ibis, and Abbey or professor.

We doubt if this designation will be of much service to our readers, (and yet they are all most excellent casts, selected by old experts), for the selection and efficiency of flies depends greatly upon the depth and color of the water, the force and direction of the wind, and the state of the atmosphere and sky. Black goats, whitewillers, coach men, and the like, are selections made according to the judgment of the angler. The Chantry fly, or water beetle, is often very killing, and so is a peacock herl body with brown speckled hen's wings. As a rule, use large flies for quick or rough water, and small ones for a placid still surface.

We shall continue these subjects through the season.

—SHAD have recently become known as a game fish and promise to become a valuable addition to our somewhat limited list. In reply to numerous requests for information respecting shad fishing with fly, we will state that we shall be able to give to our readers henceforth all that has been learned upon this new branch of sport by those who have made practical investigation thereof, and whose names alone are sufficient authority for the value and accuracy of the information they supply. This will embrace fly-fishing on the Savannah, Delaware, Hudson, and Connecticut Rivers, designating suitable localities thereon, and practical tests of flies and tackle, and such other data as we may deem serviceable to our readers. We have on our desk a very carefully prepared article on the Connecticut (crowded out this week) by Wm. C. Prime, Esq., the veteran angler and author, which we shall print in our next issue.

Our aim in this department is always to give *seasonable* information, as we feel that articles are more interesting at such times than when the mind is diverted to other subjects, just as strawberries and peaches are more grateful in the broiling summer months than in the bleak and chilling weeks of early spring.

—We are pursuing our investigations of the Michigan grayling through parties now on the ground, and hope to add much to what has already been published. All that is known of this remarkable game fish, as found in America, can be found in our columns by referring to the Index, pages 92, 122, 280, 314.

—"Bro. Doty," the veteran angler, now 87 years of age, and well known to three generations of the craft of Long Island, last week went to South Oyster Bay, caught eleven trout, and returned the same day—which the same is quick work for a nonagenarian.

—Fifteen hundred salmon trout were deposited in the Schuylkill River near Norristown last week by the Pennsylvania Fish Commissioners. A large number of black bass have also been planted near the same place, both above and below the falls. After the first of next June, bass-fishing with hook and line will be permitted in the Schuylkill, the three years close season fixed by law expiring at that time.

—Schooner Lizzie K. Clark of Gloucester, Capt. Edward Morris, which arrived from the Grand Banks on Monday, brought in 85,810 pounds of halibut, and stocked \$4,676. The time occupied in making the trip was seventeen days, the shortest ever made to the Grand Banks. There have been but few larger fares of halibut brought in than this in past seasons. The Lizzie K. Clark has stocked on her three trips this season rising \$11,000, and bids fair to make a big year's work.

—The first brook trout caught at Sandwich, Mass., was received in Boston by Messenger, Bros., on Friday of last week. They were caught by W. F. Lapham, Esq., and embraced in all about fifty speckled beauties, weighing from a quarter to two and one quarter pounds each. The first choice was secured by a gentleman in the government service, who forwarded a handsome selection to President Grant and P. M. General Creswell.

—Schooner Lizzie K. Clark, Capt. Edward Morris, which arrived at Boston from the Grand Banks on Monday, brought in 85,810 pounds of halibut, and stocked \$4,676. The time occupied in making the trip was seventeen days, the shortest ever made to the Grand Banks. There have been but few larger fares of halibut brought in than this in past seasons, and larger stocks only in two instances.

—Schooner John F. Monson of Gloucester, Capt. Spurr, engaged in the haddock fishery, has stocked \$8000 since the first of November, the crew sharing about \$400 each. She bids fair to make up her stock to \$10,000 before the season closes.

—The Georgesmen are arriving freely the present week from their second trips, with uniformly good fares.

—The only Penobscot salmon in the Boston market Thursday week weighed twenty-one pounds, and was sold for \$31.50.

—Since December 1st the Connecticut River has been frozen over and freed of ice five times, a fact without precedent for more than forty years.

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

HIGH WATER, FOR THE WEEK.

DATE.	BOSTON.	NEW YORK.	CHARLSTON.
	h. m.	h. m.	h. m.
April 2	11 53	8 36	7 53

April 5	1 39	10 21	0 29
April 6	2 22	11 4	10 23
April 7	3 8	11 53	11 8
April 8	4 1	eve. 47	eve. 1

—The yacht "Vindex" is expected shortly to return from her cruise in Southern waters, preparatory to hauling out and fitting for the coming season, though in her case it is questionable whether season is the proper term to be used, not having been out of commission during the whole year. During her run from Hampton Roads to Savannah she had an opportunity for demonstrating her excellent sea going qualities as she encountered the recent heavy gales from the S. W. She made splendid weather of it, although the wind was of sufficient violence to burst her close reefed main-sail and tear out the clew of her fore stay-sail. After hammering away against wind and sea for five days and four nights, a portion of the time through the thickest of weather, Mr. Center, her owner, who, as usual, had command of the yacht, had the pleasure of turning over his responsibility to a Savannah pilot. We say pleasure, because no matter how enthusiastic the yachtsman, we can imagine a gale of wind at this season of the year on our coast, may become monotonous after a time.

—The "Gracie," Mr. J. R. Waller, is in the hands of her well-known builder, Edward Smith, of Nyack, undergoing extensive alterations. Her length is to be increased four or five feet, about four inches added to the height of her top-sides, and she will have two feet additional beam.

—The "Tidal Wave," Mr. W. Voorhis, is also at Nyack, having her length increased fourteen feet by fining out her bows.

—In the departure of the "Vixen" from our waters, the scene of so many victories for her, we regret not only the loss of the fleet little vessel, but that with her will go a constant reminder of her former owner and his father, both most popular gentlemen and enthusiastic yachtsmen. She has been sold to a gentleman in Boston, who is raising her about eight inches, we understand. Whether this additional height will go to increase her free-board, or draft of water through use of more ballast, we do not know, but should not imagine any change would have been deemed essential after an inspection of the quantity of plate won by her in the hands of the late Mr. Livingston.

—The Louisiana State Rowing Association dissolved, because the clubs could not agree upon a date for the annual regatta.

—The preparations about Saratoga Lake for the college regatta will be supervised by Mr. W. J. Costar. The work will begin this week.

—The "Magic," Mr. W. Garner, is early in commission this year, having passed Whitestone some days since en route for Staten Island.

—The New Jersey Yacht Club held their annual election at Hoboken March 26th. Commodore Ketchum was re-elected. John R. Wiggins was elected Vice Commodore and I. Rogers was elected Treasurer.

—At the last meeting of the Long Island Yacht Club the following officers were elected:—Commodore, Jas. Sweeney; President, Dr. Charles B. Evans; Secretary, George Crolus; Treasurer, Frank Bates; Measurer, Henry Smedley. The 18th of June has been fixed for the holding of the club regatta.

—The Atlantic Club have equally encouraging reports. A number of new schooners will be added to their squadron. The regatta this year will be on the 10th of June, the day preceding the cruise of the New York Club. They have chartered the steamer Magenta for the accommodation of their guests. The officers of the club for the ensuing year are:—Mr. J. R. Maxwell, Commodore; Mr. J. A. Monsell, Vice Commodore; F. H. Slot, vice H. J. Gouge, declined, Rear Commodore; Mr. John B. Morgan, Recording Secretary; Mr. W. B. Davenport, Corresponding Secretary; S. W. Nowies, Secretary and C. T. Lippitt, Treasurer. The Regatta Committee is composed of the following gentlemen:—Messrs. W. B. Davenport, Chairman; H. A. Gouge, J. L. Marcellus, S. V. Lowell and S. W. Nowles.

—At the second general meeting of the New York Yacht Club, held at their rooms on Thursday last, the committee previously appointed submitted a draft of resolutions expressive of the deep regret of the club for their loss in the deaths of Ex-Rear Commodore Anson Livingston and Mr. William H. Major.

—Last week the Brooklyn Yacht Club held a meeting, which was attended by all the members. The object was to fix upon a time for the annual regatta, the course and the classes of vessels. This club will hold its regatta on Tuesday, June 16, over the same course as last year. According to the reports read and received, the organization is in a most flourishing condition. Over 75 vessels belong to the squadron, and five are being built. The officers are the same as last year.

—Our article upon canoeing has been crowded over to our next number by a pressure upon our columns this week.

—The Stapleton Yacht Club of Staten Island will hold their spring meeting at the club rooms, on the second Tuesday in April, to make the necessary preliminary arrangements for the season. Mr. Ralph Munroe, of Clifton, is building a new yacht, to be sloop rigged, and which will be added to the Stapleton fleet, making a squadron of twenty-six boats.

THE OXFORD AND CAMBRIDGE BOAT RACE.—On Saturday, March 28th, Cambridge achieved another victory over Oxford, making the fifth in succession, beginning with the race of 1870. However, for the six years before this date, Oxford won as many consecutive races, so the honors are very nearly even for the past decade. The day was all that could be desired, and shortly after half-past ten o'clock the two crews made their appearance on the river. Very little time was lost in arranging the preliminaries and getting into position, and on the signal from the umpire's boat, which, by the way, had on board of her the Prince of Wales, his children and the Duke of Cambridge, the oars of the two boats took the water almost simultaneously, and the contest for the University championship began. They held together without any material advantage being perceptible, both crews doing good work and showing the effect of their excellent training until near the Soap Works, when Cambridge began gaining steadily. At Hammersmith Bridge a terrific struggle took place for the lead, each boat doing its utmost. Cambridge however maintained her advantage, and atorney Reach the boats were over a length apart. From this point Oxford had no chance of regaining her lost honors. Cambridge, during the whole race, was never headed, and passed the line four lengths in advance. Time, 23:35. The course was the usual one, on the Thames, from Putney to Mortlake.

The following are the names and weights of the respective crews. Both boats were built by the Claspers of Oxford and about sixty feet in length:—

CAMBRIDGE.

Name.	Lbs.
Bow—P. J. Hibbert, Lady Margaret	155½
No. 2—G. F. Armytage, Jesus	162
No. 3—J. B. Close, First Trinity	158
No. 4—A. S. Eastcourt, Trinity Hall	198
No. 5—W. C. Lecky-Brown, Jesus	176
No. 6—J. A. Aylmer, First Trinity	178½
No. 7—C. S. Read, First Trinity	174
Stroke—H. E. Rhodes, Jesus	165
Coxswain—W. F. A. Lambert, Wadham	105

OXFORD.

Name.	Lbs.
Bow—H. W. Benson, Brasenose	160
No. 2—J. S. Sinclair, Oriel	160
No. 3—P. Williams, Corpus	170
No. 4—A. W. Nicholson, Magdalen	132
No. 5—J. Williams, Lincoln	180

Stroke—J. P. Way, Brasenose	147
Coxswain—W. F. A. Lambert, Wadham	100

Oxford is still one victory ahead, as will be seen by the following table:

Year.	Date.	Winner.	Courses.	Time.	Won by
1829	June 10	Oxford	Henley	14.30	Easily.
1836	June 17	Cambridge	Westm to Put	36.00	1 min.
1839	April 3	Cambridge	W. to P.	31.00	1 min. 45 sec.
1840	April 15	Cambridge	W. to P.	29.30	4 lengths.
1841	April 14	Cambridge	W. to P.	32.30	1 min. 4 sec.
1842	June 11	Oxford	W. to P.	30.45	13 seconds.
1845	March 15	Cambridge	P. to Mort	23.30	30 seconds.
1846	April 3	Cambridge	M. to P.	*21.05	2 lengths.
1849	March 29	Cambridge	P. to M.	22.00	Easily.
1849	Dec. 15	Oxford	P. to M.		Font.
1852	April 3	Oxford	P. to M.	21.36	27 seconds.
1854	April 8	Oxford	P. to M.	23.29	41 strokes.
1856	March 15	Cambridge	M. to P.	25.50	4 lengths.
1857	April 4	Oxford	P. to M.	23.25	35 seconds.
1858	March 27	Cambridge	P. to M.	21.23	22 seconds.
1859	April 15	Oxford	P. to M.	24.40	Cam. suit.
1860	March 31	Cambridge	P. to M.	26.05	1 length.
1861	March 23	Oxford	P. to M.	23.30	48 seconds.
1862	April 12	Oxford	P. to M.	24.41	30 seconds.
1863	March 23	Oxford	M. to P.	23.05	43 seconds.
1864	March 19	Oxford	P. to M.	21.40	26 seconds.
1865	April 8	Oxford	P. to M.	21.24	4 lengths.
1866	March 24	Oxford	P. to M.	25.35	15 seconds.
1867	April 13	Oxford	P. to M.	22.40	4 lengths.
1868	April 4	Oxford	P. to M.	20.56	6 lengths.
1869	March 17	Oxford	P. to M.	20.05	3 lengths.
1870	April 6	Cambridge	P. to M.	22.04	14 lengths.
1871	April 1	Cambridge	P. to M.	23.05	2 lengths.
1872	March 23	Cambridge	P. to M.	21.15	2 lengths.
1873	March 29	Cambridge	P. to M.	21.35	34 lengths.
1874	March 28	Cambridge	P. to M.	23.35	4 lengths.

*The first university race rowed in outriggers.

†The first race in which either university rowed in the present style of eights without keel; also the first time either rowed with round oars, both using the same kind of oars and boats.

‡First year both crews used sliding seats.

—The new boathouse for the Yale College oarsmen is to be built on plans furnished by Cummings & Sears of Boston, will cost \$12,000, and will be by far the best one in the country. It is to be built with a view to elegance as well as convenience; it will be surmounted by a spire, and have a covered piazza on three sides. It will have room for sixty boats and all the fixtures.

—A letter from a Harvard student says: "It is proposed to establish a dozen small boat clubs here, to which any student can become a member by paying a small fee. The boats of these clubs to be paid for by the money thus raised by the members of the same, and the boats to be deemed as common stock." This plan has the good wishes of all the students, and good may come of it.

—The great events in rowing circles this season will be the college regatta, the fourth annual New England regatta, and the regattas of the Saratoga Rowing Association, Harlem Regatta Association, the Schuylkill Navy and the National Amateur regatta at Troy.

The fourth annual New England Regatta, open for amateurs and professionals from any part of New England, will take place on Charles River, some time in May, for the single scull championship. The prize for amateurs will be a massive gold medal representing an oarsman standing in a boat, with a pair of spoon oars elevated from a whole to be enclosed in a circle of gold, suspended from a fine medal pin of the same material, and appropriately inscribed. The prize for professionals has not yet been decided upon.

The college regatta will be rowed on Saratoga Lake July 16. Nine crews will take part, viz: Harvard, Yale,

Trinity, Columbia, Princeton, Williams, Cornell, Wesleyan, and Dartmouth. Of these the first three have already engaged training quarters.

The Saratoga Rowing Association regatta will take place August 24, 25, and 26, at Saratoga Lake. It will call together representatives from nearly all the amateur and professional organizations in the United States.

The Schuylkill Navy regatta will take place at Philadelphia some time in June, and will be open to all clubs in the United States and Canada. The Harlem Regatta Association races will take place on the Harlem River early in July. The National Amateur regatta will be open to all amateur oarsmen in the United States, and will take place at Troy in August. Regattas will also be held on the Charles and Mystic Rivers, and Jamaica Pond, June 17, and on Charles River July 4.

CORNELL UNIVERSITY.
ITHACA, N. Y., March 30, 1874.

EDITOR FOREST AND STREAM:—

The crews are in training now in the gymnasium, as far as rowing-weights can give training, preparatory to the spring regatta, which will probably take place in June. The crew for the Inter-Collegiate regatta is not as yet definitely selected, it being left till practice in the shell will enable a better decision to be made. A paper pair and six-oared shell have been ordered of Messrs. Waters & Sons for the use of the "Mary," and we shall now be able to test carefully and thoroughly the two kinds of boats—wood vs. paper—and find out which is best adapted to our use.

—We are requested by the Saratoga Rowing Association to print the following card:

SARATOGA ROWING ASSOCIATION.

It is necessary for the Saratoga Rowing Association to have the address of every amateur rowing club of good standing in the United States and Canada. The Association propose to issue soon its circulars concerning its annual regatta, which will be given some time in August. Therefore it is to be hoped that all rowing clubs will send their address, giving name of President and Secretary, so that none may be overlooked, nor fail to receive circulars. Address

SARATOGA ROWING ASSOCIATION.

Rational Pastimes.

Will our University correspondents kindly send us their most recent catalogues.

—On Saturday afternoon, March 28th, the Nameless Club, of Brooklyn, mustered up force at the Capitoline grounds, and had a practice game between their first and second nines, which ended as follows:—

First Nine—5 3 5 1 4—18.

Second Nine—0 2 0 1 2—5.

The game was played under the old rules, the umpire not being posted in the new code. It is time that the amateurs got hold of the new rules and studied them up well. "De Witt's Guide"—Mr. Chadwick's work—is now out, and there is an explanatory appendix to each rule of the code. Certainly the professionals ought to post themselves up in the rules at once, for nearly all are ignorant of the new code. Of the play shown in the practice game of Saturday by the Nameless, the excellent catching of Crosby was worthy of special mention. He will make a fine player in the position, being plucky and skillful in facing and judging the pitching. Mayhew was wild in his delivery, and under the new rule of "wide balls" half of his opponents would have been sent to bases on wides. Pitchers will have to be careful of this "wide" business this season. On called balls more latitude is allowed than before, as only every third ball not over the base can be called. But in the case of wide balls every ball out of reach is obliged to be called a wide by the umpire whenever delivered, and every ball touching the ground in front of the home base, or which touches the batsman's person, or which is out of fair reach of the bat in any way, is a "wide" ball, and must be called the moment it passes the line of the home base. The Nameless club have a fine corps of amateur players to choose from this season. On Saturday, though it was "too chilly to play ball" for some of the professionals present, the amateurs went in for practice with spirit. The game played was marked by thorough good humor, and it was fully enjoyed. The second nine played some of their positions very well, Gray doing some good catching behind the bat, and Merritt fielding actively at short field. On the other side Smith's base play was excellent. Carpenter assisted once in good style. They will have to put "Carp" on the nine.

The Montague club also had a little practice game on the upper field on the same day.

—On Wednesday the amateur clubs were to meet again on the Capitoline field, and the Chelseas were to play the Davis nine. Jackson, of the Staten Island nine of 1873, has joined the Chelseas.

—On March 30th the Athletic club defeated the Modocs in a match game at Philadelphia by a score of 27 to 4.

—The Atlantics opened play at the Capitoline grounds for the season of 1874 on March 30th, when a large crowd gathered to watch the proceedings, the weather being propitious. The Atlantic nine played a strong field ten, with the following result:—

Field—0 0 0 3 1 0 1 1—6.

Atlantic—0 1 0 0 7 0 0 1 7—16.

Umpire, Mr. Chadwick; time, 1:40.

—The first grand championship game of the season in the professional base ball arena will take place on Thursday, April 16th, when the Philadelphia and Athletic nines will meet at Twenty-fifth and Jefferson streets, Philadelphia.

—Three tons of base ball bats have been shipped by a single Vermont manufacturer to the Boston market this winter.

—The French billiard player, F. Ubassey, will leave for Europe in May.

—A. P. Rudolph, now in Chicago, is expected in New York.

The match between A. Garnier and Maurice Daly will take place at Tammany Hall on April 3d for \$1,000 a side, 600 points up.

—Joc Dion is practising with Maurice Daly for his match for the championship every evening at the Spingler House billiard rooms.

—There is some talk of having a tournament in Philadelphia, as a party is negotiating with four of our leading professionals to give exhibitions in that city, and that there will be another tournament held in this city some time this month.

—Dean Brothers' Hall in Fulton avenue was the scene of some good billiards on the 26th March, Thursday. The occasion was a match game between Mr. Daniel Dean, well known in Brooklyn as an old billiard host, and Mr. John T. Reeves, of New York. Also a game between the Chicago expert, Mr. Bassinger, and Mr. Reeves. Both of the games played were the four ball carom, the first game 1,000 points up, the second 500 points up. Mr. Reeves was the winner of both, beating Mr. Dean readily, who appeared sadly out of practice, as his score of but 484 points in the 1,000 will show. The second game Mr. Reeves won by a score of 501 to 435, although he won it out of the sheer good nature of Mr. Bassinger, whose manipulation of the ivories showed a latent skill which could have done far better than the result proved.

The following is the score of the last game:—

Reeves—0, 30, 15, 42, 15, 63, 3, 15, 15, 54, 153, 9, 3, 12, 87; total, 501; winner's average, 35 11-14.

Bassinger—6, 81, 36, 33, 12, 204, 9, 6, 12, 6, 18, 0; total, 435; average, 43 6-13.

—The Brooklyn Chess Club's spring tourney was commenced on March 21st, and the result of the first round of contests ending March 28th, was as follows:

Player.	Won.	Lost.	Player.	Won.	Lost.
Delmar	11	0	Phillip	1	1
Dr. Barnett	11	0	Elwell	1	1
Spence	11	0	Abraham	1	1
Perrin	11	0	Bagaxt	1	1
Turner	1	1	Ingalls	1	1
Davis	1	1			

All the others lost more games than they won.

LA CHASSE ILLUSTRÉE.—We would call attention to the advertisement of *La Chasse Illustrée*, the leading journal of the Continent, devoted to the interests of the sportsman. Handsomely printed, and profusely illustrated, it is written with that exceeding grace which only Frenchmen possess. Our most *spirituelle* contemporary, however, includes in its columns numerous articles relating to natural history, ornithology, and pisciculture, which are of the greatest merit and originality. On its editorial staff may be found some of the most distinguished of French authors, whose names our own readers are familiar with. Published weekly, it furnishes the reader with all that is newest and freshest in regard to the numerous zoological collections on the Continent. By subscribing to *La Chasse Illustrée* those desirous of becoming acquainted with French can have the most charming of text books, for there cannot be found a more easy method of acquiring a language than by the reading of a paper which both amuses and instructs. Not only should our numerous French friends who read us take *La Chasse Illustrée*, but our own people should subscribe to it, remembering that those who acquire another language take to themselves another sense. The well known firm of Firman Didot frères, No. 56 Rue Jacob, Paris, are the publishers, and M. Chevalier, formerly of the *Courrier des Etats Unis*, is its editor. The subscription is \$5 a year.

—On Tuesday last we inspected at Mr. Blackford's, in Fulton Market, the first salmon from the Oregon rivers which have arrived this season in our eastern markets. Noble big fellows were they, weighing about 25 pounds. In appearance the California salmon differs materially from our own fish, being more chunky and thicker through, and without those graceful outlines, which render our salmon the personification of beauty. Some of our friends, fish-eaters *par excellence*, inform us that the *Salmo Quinnet* is quite as good as the best Canadian fish. At Mr. Blackford's we saw two Maine trout of two and three pounds weight.

—FOREST AND STREAM has got as far as New Mexico in its travels. We have one subscriber in the Territory, and now comes the Albuquerque *Republican Review*, printed half in English and half in Spanish, requesting an exchange. We have great encouragement to hope for an extended circulation in the land of the Pimos, Apaches and Maricopes!

—Over 500 acres of scrub oak and pine land were burnt over near Farmingdale, Long Island, last week, involving a loss in timber, cattle, fences, &c., of \$150,000. This section of the country is noted for its quantities of game, rabbits especially, hundreds of which must have perished.

—During a late discussion on a trout bill in the Massachusetts Legislature, Mr. Butterworth, of Brookfield, raised quite a laugh by moving to amend by providing that if trout less than three inches bite they shall have leave to withdraw.

—The Selma Exposition Jockey Club of Selma, Ala., opened on Monday and continued three days. Splendid stables from New York, Boston and Baltimore were present. The New Orleans and Mobile stables were especially fine.

—A census of the Lake Superior Chippewas, according to the pay rolls, shows an increase since 1856 of 1,182 souls.

—A devout observer of Lent says that about this time he begins to feel scaly.

—We have several communications in type which will appear in our next.

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

LINCOLN AND SEWARD. By Gideon Welles, ex-Secretary of the Navy. N. Y.: Sheldon & Co.

It is the duty of every critical reviewer to state in plain unequivocal terms the character of the work he reviews; also, if historical or political, the animus of the leading characters spoken of in the work. Persons reading the life of Abraham Lincoln by W. H. Seward would, if they read this little work as a mere narration of facts, be led erroneously to suppose that instead of Abraham Lincoln, the President of these United States, the live, acting head of the Administration, he was, to a certain extent, the puppet of W. H. Seward, which, as a fact, has not the shadow of truth, as all the acts of Lincoln fully prove. He undoubtedly consulted with the Secretary of State on all occasions, and listened with due deference to the councils of Mr. Seward; but Abraham Lincoln's whole administration, when carefully examined by true history, give the lie to the idea that the President was ruled by any "power behind the throne." Mr. Lincoln made sure that his policy was to the best of his judgment right; any other opinion, received from whatever source they may come, we believe to be untrue and false. Lincoln's policy was the leading policy, and his conceptions of right his own, and he acted upon those convictions with an eye single to the interests of a country then passing a great and trying crisis of her history. We think every candid reader of this work will give Mr. Lincoln all the credit he is so truly entitled to, and not be governed by any of the specious arguments to the contrary.

MARTYRDOM OF MAN. By Winnwood Reade. N. Y.: A. K. Butts.

Mr. Reade in this work opens the question of the influences which have had a tendency to oppress and degrade the standard of manhood in the ancient and modern times. The work is one in which much ability and careful research and no little analytical power is evident. We are sorry that the author has not given us a larger work, for from a careful reading of the work, we think he should have had more space to develop his idea. More radical in tone than many works upon this subject, the author is sometimes very severe, if not bitter, in certain attacks on what he believes to be erroneous in religion, theological teachings, and every false doctrine. The work is without doubt conscientiously written, and when read with a view of getting good, will, besides imparting much useful information to the general reader, prove reformatory. For sale by Lee & Shepard, Boston.

Robert Carter & Brother, New York, have just published two juvenile works of much merit, entitled "Between the Cliffs" and "The New Schellans." Both of these stories are very well told, and the ground they cover cannot fail to improve, as well as instruct, our young people. Carter & Co. have been quite successful in their selection of interesting matter for the young, and we are grateful to see this house is to a certain extent making a specialty of this kind of literature.

DIAMOND CUT DIAMOND. By T. Adolphus Trollope. New York: Harper & Bros.

In this story of Tuscan life, where all the incidents, like a *finé alto relievo*, stand out distinctly, we become at once interested with the most minute characters. Domenico Rappi, a fattone or ballif, one who has the oversight and management of landlords, is a resident of the upper Arno. His "religious wife," his two daughters, like their good mother, think there is no priest among priests who deserve more implicit service than holy father Don Iguazis Vermino. Yet the younger daughter is somewhat heretical in her idea, and like her father likes to do her own thinking. As may be judged, the forte of the author is found to be in his attempt to make a pretty readable anti-Catholic novel. Quite readable, and dealing with everyday life rather than with monstrous incongruities, all that is here told may have been; there is no shocking of one's conscience; the priest even has a conscience, for a peculiar belief of his leads him to consider "God and the church to be and to mean the same thing, and the service of one to be the service of the other." He schemes, as he supposes, pretty wisely, when he attempts to make a home in a convent for one of the daughters preferable to her father's house and care. The story is simply and well told, and to sum it up in a word, it is one of the many stories of priestly interference with the domestic life and family arrangements so often found in Italy and Tuscany. The finale is good; the book pleasant.

FABLES IN SONG. By Robert Lord Lytton. Osgood & Co. Boston.

All our readers who hung delighted over the sweet poems in "Lucille" will find our author has given them, not a pastoral, a ballad, or a story of love in "Fables in Song," but a sober, interesting collection of fables in which birds, as in the olden time, held converse with each other. Every poem is finished, and has a moral, such as is easily understood. The little things are here cared for, and the grains of sand have their lessons and their mission. "The Two Fables," "Who's in the Right?" give fine illustrations of general effects. Overflowing with specimens of shrewd good sense and pleasant style, it is a work that will have many readers. It is in Osgood & Co.'s usual tasty style.

EARLY LESSONS IN NATURAL SCIENCE. With illustrations. Claxton, Remsen & Haffelfinger. Philadelphia. 1874.

SHIP AHOY. A Yarn in Thirty-six Cable Lengths. Illustrated by Wallis Mackay and Frederick Waddy. N. Y.: Harper & Bros.

When you commence the reading of this book you may feel assured by the first cable length that you will be sure to overhaul every yarn before you coil up a single length. This work, we are sure, will have a great sale. It has to recommend it to the public a lively naturalness of conception, that gives to it all the elements of a historical romance; and alas! there is more truth than fiction in this startling nautical story. Virtue, in the end triumphs, and vice is punished; yet not according to the prescribed rules and judgment of men. This work has a fascination about it rarely found in sea stories of the kind of "Ship Ahoy" series. Finely illustrated with spirited engravings.

ANNOUNCEMENTS.

The Life of Charles Sumner. By the Rev. Elias Nason. In press, and will be published May 1st by B. B. Russell. Boston.

Mr. Nason is quite well fitted to make a life of the great statesman not only true in detail, correct in statements of his eminent, world-wide service, but from a long and intimate personal acquaintance and intimate relationship, he will make a work every way deserving the appreciation of the lovers of the great worth of the venerated statesman so recently deceased. We shall refer to this work again.

ROWING AND ATHLETIC MANUAL FOR 1874. This concise little work gives the record of races, the National Amateur Regatta rules; also an article on the "sliding seat," and other useful information to oarsmen and amateur athletes. Edited by James Watson, of *Wilkes Spirit of the Times*.

THE HISTORY OF NORTH AMERICAN BIRDS. By S. F. Baird, T. M. Brewer and R. Ridgway. Land Birds. Illustrated. Vol. III. Boston: Little, Brown & Co. 1874.

—Detroit Free Press: When a Chicago paper commences an article by saying, "An idiotic newspaper concern in this city," &c., the seven other papers take it up as a personal hit.

VIENNA, AUSTRIA, Nov. 30, 1873.
Messrs. Wm. S. Kimball & Co.:

Sirs—A friend of mine sent me, with a transport of Indian Skins, two pounds of "Vanity Fair," which I declare to be the best Tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair" is the King of all, by its aromatic flavor and the right sort of strength. My friend in New York got an appointment in California, by that reason I apply immediately to you, begging you to send me for the enclosed ten dollars, a supply of "Vanity Fair," and send with the next steamer to Germany. If there is a German firm that sells your excellent "Vanity Fair," I beg you to enclose me the address.

and Reels of the finest quality. Lines of every kind. Gut and Gut Leaders. Also, sole agents for the celebrated **JOHN JAMES & SONS** Needles and Fishhooks. A large lot always on hand of Southern cane and selected Calcutta Bamboo Poles. *-6m

Sportsmen's Goods.

This arm was submitted in competition with over one hundred different systems, American and European, to the Board of United States Officers, appointed by Act of Congress, 6th June, 1872, for the purpose of selecting the best arm for the service, and of which Brig. Gen. A. H. Terry was President. It successfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for the military service by all nations is only a question of time; that whenever an arm shall be devised which shall be as effective as a single breech-loader, as the best of the existing breech-loading arms, and shall at the same time possess a safe and easily manipulated magazine, every consideration of public policy will require its adoption."

"Resolved, further, That the experiments before the Board with the Ward-Burton Magazine System have so impressed the Board with the merits of this gun, that they consider it as more nearly fulfilling the conditions above specified than any other tried by them or of which they have any knowledge, and it does recommend that a number of magazine muskets be made on the plan for further trial in the field." (See Ordnance Report.)

We are now making these guns to supply the numerous demands, and will soon have them in the market.

The following is our scale of prices: Special Magazine for large game, carrying from 3 to 8 cartridges, 70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10 lbs. weight, from \$60 and upwards, according to finish. Special Long-range Magazine Rifle for Creedmoor shooting, 90 grs. of powder, 480 grs. of lead, carrying 3 to 8 cartridges, weighing 10 lbs., from \$100 and upward. Magazine guns for general use, carrying 3 to 9 cartridges, 60 grs. powder, 350 grs. lead from \$40 and upward. Single Breech-Loader, Creedmoor shooting, for long range, 90 grs. powder; 480 grs. lead, from \$60 and upward. Single Breech-Loader for general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead, from \$30 and upward. The calibre of all our rifles, unless otherwise ordered, will be 45-100. in.

For Forest and Stream.
THE BUFFALO HACKMAN.

A LEGEND OF NIAGARA.
THE Hackman stood by his empty coach,
The Hackman spake no word,
But, with eyes cast down and a moody frown,
Whispered an oath unheard.
That sullen man was Zack,
Who drove the "whirlpool" hack
From the Whirlpool House to the train and back,
And took the stranger in.
Noisier man than he,
Bolder to charge his fee,
Quicker to lie or cheat, would be
A miracle of sin.
For Zack was the chief of all
The ruffians who used to brawl
And bawl and haul and maul
The traveling public clanking to fall
Into their ruthless claws—
Used to, yes, for happily now
The wise authorities don't allow,
The rowdy crew to annoy you, laws
Being passed, I suppose, to that effect,
And the vile career of the rascals checked.
For the law, and its penalty must be dread,
Has silenced each noisy Jehu's head,
And developed the use of his hand instead;
He points to his coach, he points at you,
You enter the carriage *et voila tout!*

So Zack, to-night, stands gruff and glum,
And to all intent is utterly dumb,
When the train arrives, with its terrible rum—
—ble and creak and jar,
And a stranger alights, with a flavor of tar
On his person; unpleasant, but less by far
Than the odor of whiskey, proclaiming strong
That he to the Templars don't belong.
Figure *embonpoint*, tub-like, squat,
In sea-boots, jacket and naval hat,
Voiced like a cracked, discordant gong—
Pen picture of Captain Stormaloug,
Gent of the merchant naval school
Who wants "to be druv to the 'Whirlpool.'"
Is "druv," and sleeps,
While Zachary keeps
Watch at the door till daylight peeps,
And catches the captain *exeundem*.

Wroth, I ween, was that simple guest,
By touters, hackmen and guides distressed,
Whose noisy clamoring almost stunned him.
Worried he turns to Zack, to know
"How much to investigate the show?"
"Seven dollars" (whereat he smiles)
"An hour," adds Zack; "its eleven miles
By the shortest cut." "Wa'l, go ahead,
Jest charge what you like," tne victim said
With a smile serene. As the carriage rolls
On its way, says Zack: "You pays the tolls."
"Pay 'em yourself: U'll make it right
When I settle for all with you to-night.
And, see here, you may buy some little traps,
Jest for souveneers, from them Injun chaps.
And mind! I must see the hull thing too,
Drive everywhere! Neow, put her through."
They drove to Goat Island, to the brink
Of the American Falls, where the captain, inc—
Autiously stooping to take a drink,

Was almost whirled over.
For a beautiful, treacherous place is there,
Where the tide is shallow and calm and clear;
Where the half-reluctant waves delay
On the abyss brink, in idle play,
Tempting the careless rover,
With wanton eddy and laughing wave
The might of the water fiend to brave;
Where their final leap into death they take,

And into a myriad dewdrops break,
Falling like snow's ethereal flake
Or the gentle summer rain,
Till the sun, beguiled by the phantom bright,
Gems its glory with prism'd light,
And they smile in their dying pain.
Where feathery spray is upward cast,
And lost in the rain drops falling fast,
Like showers of pearls from on high
Thrown by some willful cherub boy.

Heow much mout it be?"
"There's the kerridge and me,
That's *seven* apiece by the hour—let's see,
Five is a *five*—and the tolls is *three*—
And a baby's shawl
And a rubber ball,
And a Injun fan—is *nine* in all—
And a petrified rock from the Turpin Tower
And a kerridge at seven dollars an hour—
And *thirty* is *seventy-eight*—and me
Is *ninety-four*—and the tolls is *three*
A *hundred and one*, and a bark canoe
Is a *hundred and five*—and a shell is *two*—
A pin-cushion's *one*—and a cane is *ten*—
And a cap is—is a *hundred and twenty-one*.
(Here Zachary stole a furtive look,
To see how his victim the schedule took)—
And a kerridge at *seven* doll—" but stopped,
As the slate from his nerveless fingers dropped,
And his too prophetic tongue exclaimed,
"Well I'll be d—d!" and then "I'm blamed!
If this ain't a go!
I want to know!"
He looked before him, he looked behind,
But, for aught he saw, had as well been blind.
He examined the coach with a critical eye,
He examined the Custom House standing nigh,
He cross-examined the customs man
Then up to the Clifton Hotel ran.

He peered from the top of the Table cliff
With a half-expectant eager "If!"
He took off his boots with an insane doubt,
He turned his pockets inside out;
But look where he would, he looked in vain.
His customer was *non est*, 'twas plain,
And a "*non est* customer," though it sound
To the ear all square, isn't ever round.

* * * * *
Never did keen hotel man's eye
A trace of the vanished captain spy;
But a legend dimly floats around
That a stranded maskalonge was found
Hard by Ontario's western gate,
And that stranded fish, strange to relate,
With a naval jacket was wrapped around;
While a story, stranger, wilder still,
Proclaims that "Baggage Smashing Bill,"
The courteous guide,
On the Canada side,
In the morning's fitful light espied
The captain's glittering, glazed hat,
Sarmounting the head of a monster cat,

Or catfish, to be precise—but then,
Bill wasn't the truthfulest of men.
And somewhat conflicting with his tale
Was a letter that came by the evening mail
Addressed to Zack at the "Whirlpool,"
Denouncing said Zack as a "lubberly fool"
And "poor lime juicer," and stating how
The writer was clear of land sharks now,
With a friendly shore on his weather bow;
And detailing in nautical phrase the way
He had shipped his cable in Swindler's Bay;
With a general moral, "Afore you makes
Out your bill of charges, be sure you takes
Sekoorty for your doocs. The same
For Captain Stormalong is my name."

THE DYING CHILD.

(FROM THE GERMAN.)
HOW quietly on thy sad heart
Sleeps thy child!
Knows not its mother's griefs
Are so wild!
From lips and cheek and brow
Have faded now
Color so mild!
And yet how saintly
Smiles it faintly—
Faintly * * *
Kisses pale death!

F. C. G.

"BELLE"—IN ACTION.
THE CHAMPION FIELD TRIAL DOG OF THE WORLD.
WINNER OF THE ONE HUNDRED GUINEAS STAKES AT BALAS GROUSE TRIALS, 1873; BEATING MR. LLEWELLEN'S "COUNT-
ESS," MR. SLATTER'S "ROB ROY," MR. MACDONNA'S "RANGER," AND ALL SETTERS AND POINTERS IN ENGLAND.

Belle, the champion pointer of England, is a liver and white bitch, pupped June 28th, 1870, by Lord Henry Bentick's Ranger out of his dog Grouse, and is the champion field trial dog of her day. Winner with Sudy (No. 3) of the Bangor Stakes for Pointer Braces, and of the Country Stakes for all aged bitches at Vaynol Field Trials, 1872; and with Grecian Bend (No. 4), of the Acton Reynold Stakes for Pointer Braces, and of the County Stakes for aged Pointer bitches, at the National Pointers and Setters Field Trials held at Combermere, near Shrewsbury, April 29th, 1873. Also at the Grouse Field Trials, 1873. Second with Roman Fall (No. 5) in the Penllyn Stakes for Braces, August 13th, 1873. She was first in the Rhiwlas Stakes for all aged Pointers and Setters, beating Mr. Macdonna's Ranger, Mr. Llewellyn's Countess and Flax, Mr. Slatter's Rob Roy, and other celebrated performers.

Where the rain and spray in frolic meet,
And the rainbow dances beneath the feet,
'Tis a picture of beauty wild and sweet;
And forgotten all in the siren's thrall,
Is the hidden strength of the mighty fall.

Well, the captain "lowed it was very nice,
Majestick and pooty, for the price,"
And glanced at its thousand glories twice,
Indulging the while in a pensive "chaw,"
Then strolled to the Terrapin, whence he saw
The mighty torrent surge and sway,
Ere it threw its giant life away
To rise transfigured in jewelled spray,
Like the soul unprison'd from human clay;
And remarked with a rather critical air,
"Consid'ble water-peower there!"

So, to cut it short, he saw, in fine,
All the regular sights, then struck a line
By the fairy bridge for the Canada side,
Whereat he dismissed the trusty guide,
Explaining, "You know
I've concluded to go
By myself to examine this part of the show."
Assenting, said Zack, "Before you goes
For to leave me, you'll pay, if you please, what you owes;
Said the captain, "That's only square, I s'pose.

Or catfish, to be precise—but then,
Bill wasn't the truthfulest of men.
And somewhat conflicting with his tale
Was a letter that came by the evening mail
Addressed to Zack at the "Whirlpool,"
Denouncing said Zack as a "lubberly fool"
And "poor lime juicer," and stating how
The writer was clear of land sharks now,
With a friendly shore on his weather bow;
And detailing in nautical phrase the way
He had shipped his cable in Swindler's Bay;
With a general moral, "Afore you makes
Out your bill of charges, be sure you takes
Sekoorty for your doocs. The same
For Captain Stormalong is my name."

F. C. G.

For Forest and Stream.

Formosa—The Beautiful.

[Concluded from last number.]

LEAVING Liang kian in the morning the party passed through the fields of the half castes, then through the Hahka village of Poliac, a race who, claimed by China, pay tribute also to the aborigines, and to the fort hills, where the "Peppo's" reside; and then crossing the first mountain they arrived at the valley of Tanketok. Here among the mountains these reputed cannibals (the general denies the imputation) have their stronghold, and at evening arrived at the principal village.

Their way had led through a wild country, with bamboos, tree ferns, and pine apples growing wild. With the exception of monkeys, no animals had been seen, and but few birds. The cocoanut and other palms, quite plentiful a degree farther north, were missing. This was attributed to the effect of the strong winds, which in both monsoons sweep across this narrow elevated plat from sea to sea. They were welcomed kindly by the natives, and entered the village through the only gate in a strong bamboo stockade; they pitched their tents in an open square and slept in peace, except the Chinese servants, who had become demoralized at the sight of the queues of extinct countrymen which ornamented the spears of the savages.

Tanketok was away hunting, and they became the guests of the second chief, Esauck, who was, by the way, the head chief of this tribe, old Tanketok being the head chief of the confederation of eighteen tribes, of which this was the principal one.

Le Gendre speaks with enthusiasm of the neat and well kept farm, cattle yard, poultry yard, etc., of Esauck. The chief's house was a model of neatness, and comfortably furnished with chairs, tables, and pictures of Chinese origin. On a gun rack, made from deer's horns, a well polished musket was lying; he was treated with tea, spirits, and tobacco, and invited to sup. On the whole, he arrived at the conclusion that the term "savage" was decidedly misapplied as regarded this tribe. The men were clothed in deer and leopard skins, and the women neatly attired in linen trousers, with jackets covering their entire persons; their hair was dressed prettily with silver chains and red cloth, and thrown up into a crown-like coil on the top of the head. He noticed here, as did I when with him on previous excursions, the peculiar ear-rings worn by the women. In childhood a hole is pierced through the lobe of the ear; this is enlarged by degrees, as the ear grows, by pushing in wedges of increasing size, until at last in womanhood the ear itself seems but an appendage to the ornament below, which, formed of wood or metal, is somewhat similar in size and shape to an ordinary checker. He found the women "fair and prepossessing." On this point he and I differ. All of the native women whom I have seen were very homely, and many naked to the waist; but I did not visit the Sabarees, and it is the general's notes that I am giving as regards this particular trip, not my own.

The interview with Tanketok was eminently satisfactory; the chief recognized and welcomed the general, and seemed pleased to hear that our government had approved and ratified the treaty made the year before, and that no more war ships would be sent to attack them while they maintained their compact.

The general drew up a document at the request of the chief, embracing the agreement of 1867, that he might have means of communication with any castaways. Perhaps some of the readers of FOREST AND STREAM may, in running around the world in ninety days, as one can now, get cast away on Formosa, so I will give you briefly this treaty and thus show them how to act.

"TERRITORY UNDER TANKETOK,

VILLAGE OF THE SABAREES, February 28, 1869.

"At the request of Tanketok, ruler of the eighteen tribes south of Liang-kian, including the South Bay, where the crew of the American bark Rover were murdered by the Koaluts, I, Charles W. Le Gendre, United States consul for Amoy and Formosa, give this as a memorandum of the understanding arrived at between myself and Tanketok in 1867, the same having been approved by the United States, and assented to by the foreign ministers at Pekin, viz:—

"Castaways will be kindly treated by any of the eighteen tribes under Tanketok. If possible, they are to display a red flag before landing.

"Vessels needing supplies are to display a red flag, and are not to make landing until a corresponding signal is perceived on the shore; they are not to visit the hills or villages, but to confine themselves to the locality embraced between two streams, the Tuiasokang, the first stream north of South Cape, and the Toapanguack, just to the westward of the large rock where the Rover's crew were murdered. In asking for supplies the following native words to be used:—Water is *lulium*; stones for ballast, *chachilia*; for food, *machoolia*; for the chief, *mazangiel*."

Presents were given to the chief, who accepted them with great dignity, saying:—"If these were intended to buy my friendship they would not avail, but as tokens of friendship they please me."

A ceremony apparently religious now took place, which consisted of an old crone walking slowly to and fro, sprinkling water from a cup and mumbling prayers. After this a feast of pork, rice, and samshu, and a friendly adieu was bidden.

This description of the Sabarees will, with modifications, answer for all of the tribes. We never found the "cannibals," for, upon reaching their assigned locality, like the best trout stream in our beloved land, a new one much farther off was assigned.

In 1872 the United States steamer "Ashuelot" anchored in Liang-kian Bay, and her commander, with two officers, accompanied the general on a third trip to the mountains, he to see how his pet treaty survived, they for the fun of the thing. One marine with his Remington formed either a guard of honor or protector against buffaloes. Since our buffalo adventure in 1867 the general seemed to be reconciled to having one gun along. The month was March, and until they got among the hills and in the shelter of the forest our party found it hot travelling.

They found the natives engaged in harvesting their crop of millet, and all at work in the field were fully armed—more arms than clothes, in fact; the reason of this they found upon their arrival at the village. There was a little war going on between the Sabarees and another tribe, and Tanketok was out fighting. Esauck made his appearance, but was not more than barely civil; he took no notice of the party whatever, passing by the general, who spoke to him, without even an answer. It was considered that he was jealous of Tanketok and the larger quantity of presents that had been received by the latter. However, he was not hostile, simply boorish. The chief next in rank, and the natives generally, were civil and pleasant, and when Tanketok came in he was very cordial, greeting the general warmly, and seeming much pleased at his visit. The treaty made five years ago he was still ready to hold to, but he impressed upon the general strongly that if the sailors behaved badly they should be killed. A grand dinner followed, one dish of which was to be remembered. In a huge bucket of boiling samshu were floating chunks of raw pork. Samshu is a liquor distilled from rice, and resembles in flavor a mixture of hot water, red pepper, and sour whey, with an odor of assafetida and sulph. hyd., and in effect can only be equalled by the "Injun whiskey" so graphically described in one of your former numbers.

After the dinner a concert took place, our people entertaining the savages with an accordeon; no one knew how to play it, but that made no difference, while the latter howled an accompaniment. I don't wonder they howled! Gifts were distributed, including the accordeon, and the party returned, satisfied that the treaty of '67 would be carried out.

Hunting is with the natives a pursuit more than a pastime. Wild hogs, bears, and deer they kill for the meat, and leopards, wild cats, and several other felines for their hides, all of which they preserve for their own uses during the rainy season, or barter with the Chinese through the half castes for mirrors, guns, etc.

The vegetable kingdom is magnificently represented in Formosa, and the variety of valuable trees is almost unequalled in any other country. Foremost in importance is the camphor tree, a species of laurel which grows to an immense size and in great profusion. Unfortunately, the procuring of the drug involves the sacrifice of the tree, of which, however, every pound is utilized. Timbers are selected for boat building, boards cut for export to China, where they are manufactured into chests and wardrobes, and the refuse chips are placed in cauldrons and steamed, the vapor is caught in another iron pot inverted over the lower one, and on its surface the crude camphor crystallizes. This is packed in wooden vats, with perforated bottoms, through which exudes an oil highly valued by the Chinese as a medicine. It is afterwards packed for export in air tight tubs, as like salt it will absorb moisture from the air. In 1869, 450,000 pounds of Formosa camphor was exported to New York. Teak, ebony, pines, larches, and a wood called "sung-pih," hard as live oak and indestructible in water, abound.

On the western side the mountains fall away into hills, and then a belt of alluvial plains to the sea. The hills are highly cultivated, and are dotted here and there with numerous little villages of the half castes and Chinese. Tea of not very good quality is produced; that exported goes mostly to Amoy, and is used to adulterate the more expensive blacks and "English breakfasts." In 1869, 742,000 pounds were exported to New York. Hemp, from whose fibre the Chinese grass cloth is woven, indigo of a brilliant shade, vegetable wax, or tallow, from the berries of which, when boiled, a fair substitute for tallow is procured, bamboos, rattans, pomelons, pine apples, and the "aralia papyrifera," a reed from the pith of which the Chinese so-called "rice paper" is manufactured, are the principal hill products.

On the plains great quantities of rice and sugar canes are cultivated. The former is so abundant that the island has a Chinese name, signifying "the granary." The geological structure of the mountains is but little known, the dread of the hillmen having kept the hammermen away, but so far as known a carboniferous sandstone prevails. Sulphur I mentioned in a previous paper. Coal of an inferior quality is mined at Kelung, a little port on the northeast coast; it is very bituminous, and of but little value for steaming purposes; for an American built boiler and furnace it is useless. Deeper mining than the scratching system now in vogue would probably produce better results, but the superstition which makes the Chinese fearful of offending the Fung-shui (or spirit of good or evil luck), by permitting the bowels of the earth to be pierced, arrays itself against a better system. Coal oil, very like our own petroleum, was found by Mr. John Dodd flowing naturally from a crevice in the rocks; it is more volatile than ours, but has fine illu-

minating qualities. The attempt to develop this source of wealth was of course frustrated by the Chinese, and Dodd, like many another investor in oil, lost.

The northern and western coasts possess a few small and inconvenient harbors. At each of these is located a Chinese settlement, viz:—Kelung, Samsui, Taiwanfoo, Takao, Ponglian, and Liang-kian. The first five are classed among the "treaty ports" of China, and except at Kelung foreigners have established themselves for commercial purposes. In each place—but a very few, six or eight, I believe at Samsui, perhaps a dozen or so at Takao—representatives of civilization are living, but they contrive not to be dull. They are mostly young men, English and German, connected with large firms in China, and because they have vim and character are sent over here to deal with all sorts of unexpected crises. They cannot have horse races, for there are no roads, and the quiet Sedan chair and snoot-footed coolies take the place of China ponies and Manila clippers; but the half dozen of elegant "cups" that ornament the dining room of my friend Dodd tell by the inscriptions that he himself can do his own racing, and a look through his and others' boathouses reveals an assortment of as fine lined shells, single and double, six oared gigs, "pull aways," etc., as one would care to see. Then they have the resource of dining; not simply eating their dinners, but meeting at each other's houses at seven P. M. in dress coats, white cravats, and immaculate black throughout, they with all the decorum imaginable dine. Afterwards with cheroots and wine, lying back in white jackets, etc., at ease in comfortable sofa-like, cane seated verandah chairs, or the next morning in pyjamas, slippers, and smoking caps, still more at their ease over their matutinal mangos, oranges, pomelons, and coffee they contrast with the stiffness seemingly incidental to the hour of an English dinner. At first this custom struck me as rather ridiculous—to breakfast with a man in our night clothes, to go out pulling in our undershirts, to go into the marshes for snipe in jack boots and flannel shirts, and then to withdraw for an hour to put on our best clothes to meet him at dinner seemed nonsense. But these young men, away from all home restraints, with no lady society, and few resources of any kind, perhaps it is well for them to cling to this one vestige of the civilized world.

Ponglian and Liang-kian have no foreign inhabitants. Taiwanfoo is, as the terminal "foo" indicates, a large city, with seventy or eighty thousand inhabitants; it is surrounded by a brick wall about twenty feet in height, and five miles in circuit. Vessels anchor some distance from the shore on account of extensive mud flats, and their cargoes are boated up to the city warehouses through canals. From the walls the city presents a more pleasing aspect than a closer examination makes good; the buildings are clumped together, and in consequence there are many vacant spaces, which are laid out in parks and gardens; and groves of bamboo and great banian trees give a country aspect to the scenery.

The Dutch, who, after the Chinese and the Portuguese, had in turn discovered this much discovered island, made settlements about two hundred and fifty years ago. They built strong forts, but failed to maintain their footing. The Chinese settlers arose against them, and under the lead of "Coxshinga," a noted pirate, the Captain Kidd of those days, drove them from their strongholds. Their strongest fort was at Taiwanfoo, and its ruins still exist. Over the main gate, still unyielding to the corrosive touch of time, an inscription is carved—"TE CASTEL ZELAND GE BOWED ANNO 1630."

Taiwan is the seat of government of the island, and has a full corps of Chinese officials, from Prefect down, who, coming from Pekin poor, and with small salaries managed by a process known as "squeezing" (not understood, I believe, among more civilized officials) to retire rich at the end of their term.

The climate of Formosa is not an agreeable one; there is too much rain. During the southwest monsoon it is to be expected, for that is the rainy season; but when in the autumn and winter months all China is revivifying under the influence of the clear, dry, northeast monsoon, Formosa is not so lucky. Sweeping, as this wind does, across the warm current of the Kuro-siwo, it becomes laden with vapor, which the high lands draw from it as it rushes over, and thus an undue proportion of moisture affects the island.

To sum up, there is hardly in the world so limited an extent of country that will produce so great an amount of valuable articles for export as Formosa. Its hills are full of coal and sulphur, and covered with magnificent timber. Game of many kinds is plentiful. I have had but little personal experience with the gun, having simply killed a few snipe and curlew in the marshes near Takao, but I have seen some fine bags of beautiful pheasants brought in from the hills, and have listened to hunters' stories of the death scenes of leopards and wild boars, and have seen and tasted elegant venison from a beautiful species of spotted deer, and have played with tamed fawns, which in fearless glee sported in safety in the midst of Dodd's troop of dogs.

If ever this island could but fall into the hands of, or under the control of a more liberal government, or if the persistent efforts of men like Le Gendre meet with good success, the world will be the better for it.

PRESCO.

For Forest and Stream.

MY PETS.

"IT is not good that man should be alone," says the Holy Writ. The idea usually conveyed by these words is of the necessity for the companionship of woman to effect the perfect mundane happiness of man. But that view alone is either too broad or too narrow. It is often out of the power of a man to command the society of those of the sex with whom association would be agreeable, and circumstances may be unfavorable to the enjoyment of social contact with his own at the times when most he needs it. Therefore rather than "to be alone" which we are told, "is not good," he is not to be blamed if he seeks for "company" in the brute creation, and should he find it, so much the better. Who can say that a sense of loneliness is not greatly softened, if not relieved, by the presence of an affectionate dog? In a like manner but lesser degree, a cat, bird or squirrel may supply the need.

Now if there is one time more than another when it is not good for one to be alone, that time is meal time. Good manners as well as good appetite and good digestion are promoted and stimulated by pleasant company at the table, none of which are to be despised. You who have never lacked the sweet fellowship of the home circle with its thousand warm impulses and genial influences, can never appreciate, as I appreciate, the companionship of pets like mine. Sickness, age and death have since boyhood robbed me of those who could have made the breakfast table a scene of pleasant daily reunion. Day after day, for weeks and months have I broken my bread in solitude, and have learned at last to find that companionship in my dogs and cats which was in other ways denied me.

On my left hand sits my dog "Jack," his face full of intelligence, and his mild brown eyes gazing at me with peculiar expression, for he has brought me the daily paper which the carrier threw into the hall just now, and knows he will be rewarded. His hunting days are over now, and having become one of the household his kennel has descended to "Nip," the beautiful liver and white setter pup which crouches at my feet. I had a hound named "Jerry"—short for Jerome—but I gave him away. He was sired by his daddy and anathematized by the whole neighborhood whenever the church bells rang, whereat he howled dismally.

The puppy has already breakfasted, and now bestows his whole attention upon the pretty Maltese and Angora kittens which are frisking around the room. He would enjoy greatly to have a romp with them but knows that any advance on his part would be certainly misconstrued by Maltie's mother, between whom and himself a mutually perfect understanding has not been yet established. The old lady has taken up her position on a chair near the fire, and seems to be wholly absorbed in meditation and oblivious to all that is going on around her. But don't you believe it! Her kitten is having a game of football with a cork which it has found, and I am letting my coffee grow cold in admiration of its graceful movements. Now under this chair, now under that, tossing up the cork and catching it, and exhibiting in one minute more lines of beauty than Hogarth ever dreamed of. At last the cork flies across the room, the kitten after it. Unconsciously the puppy takes a step or two forward, and at the same instant the old cat, hearing a mouse in the closet, suddenly jumps down and makes a rush for the door. This startles the kitten, whose back flies up with a warning spit, and the guilty pup in his frantic efforts to escape the retributive claws which he expects every moment to feel, tumbles over old Jack who has lain down for a doze, and their united voices add to the uproar, and make the old clock on the mantel ring again.

When quiet has been restored, I dive into the contents of the paper and soon am so absorbed that Jack becomes disgusted with my neglect, and manifests the fact by a series of short impatient nasal sounds between a grunt and a sniff, which failing to produce the desired effect, he "sings out" in a manner that sets the crockery dancing, and makes the windows rattle. I hide him into silence, and giving him a morsel bid him seek our *cuisinière* (from Cork). In other words he is told to "shut up and go to Biddy!" *Verbum sap.* He has "been there" before. To the kitchen door he waddling goes, and stands—not upon the order of his going, but—upon his hind legs, and paws wildly at the latch. Alas for the paint! In a rash moment of thoughtlessness the door which once had been white, was grained, and now, owing to a long series of miscalculations on the part of the dog, presents a truly unique appearance. It looks indeed as my aunt aptly observes "now and then, 'like the old scratch!'" To tell the truth there is hardly a door in the house which does not bear witness to Jack's determination to enter it. Constant attrition for years has produced long deep wavy parallel channels extending from the door knobs downward to the sills, wherever his precious old elaws travel harmlessly; and experience has taught him that perseverance will surely bring some one to the door who will turn that odious knob and let him in. A latch, however, he can manage very well. So bang goes the door open and out goes Jack, followed by the pup, which yells with anguish as the door, pulled too by a rubber band, closes on his tail.

To me, listening, come these words in Celtic accents, borne upon the sausage laden atmosphere. "A ha! y'ould blaggard. Is it tearin the dure agin, yez are? Bad cess t'the likes iv yez! There 's me shtick, till I knock dusht out iv yez! Taranayges! but I'll break ivery boan in yer body!" To a stranger it might seem that

nothing short of immediate annihilation awaits the poor animals, but we know better, and looking out of the window a few moments later, I observe them busily engaged in stowing away a generous meal, while Biddy surveys them from an open door. All right, my pets, I could not leave you in better hands. K.

For Forest and Stream.

HOW TO SHOOT AT LONG RANGE.

NUMBER THREE.

IN our last letter we described a long range target rifle. If it be made according to the requisites there given, by any of our good rifle makers, the errors of the instrument *itself* will be too small to be noticed. But it must be remembered that a rifle is useless without ammunition, and accuracy of shooting depends quite as much upon that as upon the rifle. Before the days of breechloaders, using fixed cartridges, the rifleman had this matter under his own control, and if he wants to make accurate shooting he should keep it so still, and not trust to cartridges loaded by careless persons, with varying charges of perhaps inferior powder, and projectiles of different weights.

For short range shooting these differences are not important; but, depend upon it, when you come to long ranges, where all errors of the rifle are greatly magnified at the target, you cannot make accurate shooting without powder of uniform strength, same quantity in each charge, and projectiles of uniform weight. To get this you must either use a muzzle loader, or cartridges that every man can load for himself. My own preference, after having tried almost every kind of rifle, is for a breechloader for accurate shooting. One reason is that you can perfectly clean the inside of the barrel after each shot, and know that it is clean. Inasmuch as it is a necessity of accurate shooting that the conditions of each shot shall coincide with that of the preceding ones, this is a matter of importance.

The other reason is, that perfect accuracy cannot be attained unless the axis of the projectile is coincident with that of the rifle; in other words, it must have a tight fit. No loose expanding bullet will shoot as true as one mechanically fitting the grooves. In the old-fashioned American muzzle loader this fit was obtained by patching the ball and the use of a "starter" at the muzzle. But by inserting the projectile at the breech it can be made to take the grooves perfectly, and without trouble or loss of time in loading. If the rifleman decides to use a breechloader he must either use the Maynard, whose cartridges are made to re-load, or he must procure shells that can be re-loaded, and a pair of bullet-moulds for his Remington, or whatever pattern he may prefer.

English practice has settled the relative proportions of powder and projectile nearly as follows:—Sufficient momentum to overcome the disturbing effects of wind at long ranges cannot be got with less weight of projectile than 400 grains, and from this to 530, (the weight of the usual English small bore projectile,) gives the best results. The tendency in England has been to increase the charge of powder from 60 grains, which was a not unusual charge ten years ago, up to 90, the weight of projectile remaining the same, 530 grains, or a little less than six times the weight of the powder. My preference is to diminish the weight of the projectile a little, say to 450 grains of lead and use 80 grains powder. This gives less recoil and does equally good work. In fact, it is as large a charge as a ten pound rifle should carry. Instead of increasing the charge of powder, our effort should be to diminish the friction. As the use of breechloaders allows of mechanically fitting projectiles, we may shorten the length of barrel. A 24 inch Maynard will do as accurate shooting at any range as a 30 inch muzzle loader with expanding ball. The metal saved in length can be put into thickness, where it will do more good. A shorter barrel evidently will give less friction than a longer one. It is to be hoped that our scientific gunmakers will make a series of exhaustive experiments to determine the proper length of barrel of a breechloader using mechanically fitting projectiles, and at the same time test the truth of Captain Hea's plan of confining the rifling to within six inches of the muzzle only.

But to return to our subject, what we are trying to attain is, that the conditions of each shot should coincide with those of the preceding ones. We should use powder of uniform quality. My own preference for short barrel and mechanically fitting projectile is Hazard Electric, of rather coarse grain. Buy enough at a time for one season's shooting, mix altogether and put in a tight tin canister. Get a small pair of apothecaries' scales, and weigh each charge with its cartridge. No accurate long range shooting can be made if this point be neglected. Cast your projectiles of lead hardened with one-part of tin. Pass all through a swage, which should be ordered with the moulds. Jacket each projectile with a piece of tough bank note paper. No system of shooting naked lead, either with or without greased canelures gives the same accuracy as can be gained by covering the projectile with paper *well greased*. Weigh the projectiles and divide them into groups varying not over two grains from each other. Use for shooting at one range one group only. Having your cartridges carefully made up after this manner and marked, so as to know those of different weights apart, be careful always to swab your rifle with a greased rag before each shot, always keeping it as bright as a mirror.

Any one who reads what we have written may think that we are advising a great deal of unnecessary trouble and nicety of manipulation. But if any thing is worth doing at all it is worth doing well. Is it not better to take a little

trouble and care to get ready and feel that you are all right, rather than to rush to the rifle range knowing nothing about what you are doing, and perhaps after making several bull's eyes, getting a miss or ricochet, because your cartridge had been carelessly filled? If any one does not think as we do, they will be convinced after seeing the practice of the Irish team. T. C. C.

For Forest and Stream.

PINNATED GROUSE FOR NEW JERSEY.

I TRUST that the timely letter of "Homo," in your Vol. 2, No. 6, will meet with the response from the different Sportsmen's Clubs and Protective Societies that the subject deserves.

The re-production in West Jersey of the pinnated grouse has long been a cherished project of sportsmen of my acquaintance. Individual efforts have been made in that direction, but various causes, the difficulty of obtaining and transporting birds, the bad faith of agents, the want of proper protection, have rendered them futile; but at no time has a doubt existed of the fitness of the ground or the perfect feasibility of the enterprise, could the birds be obtained in sufficient numbers and defended from trappers and pot-hunters. I live within a few miles of ground where they were formerly abundant. I know men who have killed them on that ground within twenty-five years. I have been at some pains to question these parties as to the particular localities in which grouse were chiefly found and the causes which led to their extirpation. Their answer to the latter question will be found in that part of "Homo's" letter, in which he says:—"The total extinction of this noble specimen of the grouse family in the east can be attributed directly to the lack of proper protective laws in their behalf; the shooting of the young birds was allowed at any time, and the persecution began, as early as June and continued each year until the pinnated grouse now cannot be found nearer than the great grass plains of our western States."

According to my informants a practice prevailed among the "Arabs," who then infested this region, more wanton and destructive than all the rest. In early spring, during the love season, the grouse being in considerable "packs" and the males remarkably pugnacious, many and continued combats occurred for the favor of the fair ones. The peculiar sound emitted by the male bird, known as "blowing," was a sure guide to the pot-hunter. At night-fall he built within easy shot of the rendezvous a brush house or "blind," and at early dawn awaited the coming of his victims. This was certain and their extermination inevitable. Unless he exposed himself to their view the game would not take flight, but continued to fight each other and to spur even the wounded and dead until the last one had bitten the dust. In my boyhood I have heard an old man say he had "killed fifteen of a mornin'."

Upon the Atsion tract, formerly belonging to the Richards' family, the grouse had an extensive range. This estate, traversed by the New Jersey Southern Railroad, consists of nearly forty thousand acres, and is now the property of Maurice Raleigh, Esq., of Philadelphia, a liberal-minded gentleman, who, I am quite sure, would afford every facility in his power toward the success of the project. Above Atsion, on the line of the New Jersey Southern and about two miles from Woodmansie Station, is a tract of land known *par excellence* as "the Plains." It is miles in extent, the ground being rolling and in many places even hilly. It is covered with a growth of scrub-oak and stunted pine which, according to tradition, has not changed in appearance or size within the memory of man. Here also grouse formerly were abundant, and owing to the difficult nature of cover maintained their existence to a later period than on any other ground in the State, the pines in many places being so thickly covered with cones or "apples" as to be almost impassible and proverbially destructive of clothing. It is now generally conceded that they are extinct.

It rests with the several clubs and societies to say if this noble game shall be reproduced. The ground which they formerly inhabited is unchanged in its features by the lapse of time; the birds can be obtained by a proper effort; the law is already passed which protects them for *six* years, and I can safely say as a member of the "West Jersey Game Protective Society," that it will co operate most heartily to effect a "consummation so devoutly to be wished." If we can make this addition to our list of game birds, what sportsman would not be prouder of his dozen grouse killed near his own home than of the hundreds he might slaughter in the distant west, where he can neither use or give them away; or who, in that ecstatic moment when he shall drop his first pinnated grouse on Jersey soil will not thank "Homo" for the letter which has afforded him the shot. W. C. H.

Winslow, N. J., March 23, 1874.

—The simplest method of sharpening a razor is to put it for half an hour in water to which has been added one twentieth of its weight of muriatic or sulphuric acid, then lightly wipe it off, and after a few hours set it on a hone. The acid here supplies the place of a whetstone by corroding the whole surface uniformly, so that nothing further than a smooth polish is necessary.

—The sportsmen of Manchester, New Hampshire, are about forming a club for the protection of game and the enforcement of the game laws.

—Two dogs kill thirty-five sheep, and wounded several more, in half an hour, on John Farnum's farm at Lanesboro, Mass., last Wednesday.

For Forest and Stream.
FORSAKEN.

(AFTER A FRENCH IDEA.)

SWEET Elsie places the flowers away,
And veils the lamps bright flick'ring glare
From a weary girl, who longs each day
For death or love to end despair.

"Oh think'st thou, Elsie, he'll come again?"
"Sleep, dearest, sleep, and let him be!"
"Aye, soon death must relieve my pain,
Then surely in dreams my love I'll see!"

A footfall echoes along the stair,
The sick girl starts—"Oh, if 't were his!"
She listens, she holds her breath to hear;
Hope wanes—for her comes not such bliss!

"Oh Elsie! never to see him again!
Never to kiss or caress him more!
To thirsting lips a flower I'll strain,
If it might make my heart less sore!"

She kissed the flower so fair and bright,
Her fond moist eyes grew ashen gray.
Hush! she has breathed her soul so white
Into the lily's pure chalice away?

For Forest and Stream.
THE ADIRONDACK TOOTH CARPENTER.

A DRAWING FROM NATURE.

THE initial number of your beautiful weekly was handed to me last August during a run of intermittent fever. I was at the time in that delicious semi-delirious frame of mind, partly convalescent, partly doubtful, and the cool, breezy FOREST AND STREAM laden with refreshing burdens of green woods and sparkling waters, wafted me, in my wanderings to those lakes and mountains I know so well. The odor of balsam and sweet smelling cedar was everywhere about me; the rush of "Buttermilk Falls" was brought back to me, and the dark flowing Raquette, with quiet grandeur, uncoiled its sullen length around the great "Oxbow." High above the sighing pines the hermit songster piped his notes. Pigmy anglers with "fiery glow worm's eyes," east about in dark pools, and with the wings of painted butterflies paddled their own canoe-shaped autumn leaves; tiny nimrods with microscopic breech-loading table forks were disputing the possession of a savory golden-edged griddle cake which had slipped through the fingers of good old "Mother Johnson." Enseoned within the perfumed petals of a gorgeous white lily, smoking hot and done to a turn, was my two pound trout, the identical rascal that smashed my rod to flinders six weeks earlier, and led me off in a series of disjointed profanity. Yes, there he sat and smoked, solemnly poring over Mr. Hallock's Annoucement, occasionally blinking a juicy eye or wagging a well crisped fin. His troutship had captured a leader this time that was evidently too much for him.

Ah me! it was monstrous cruel
To be brought to earth by—"come take your gruel."

I swallowed the compound, and still live, an admirer of nature, and of the weekly journal that champions the noble and the good in all things pertaining to Fur, Fin and Feather, and to the advancement, in a proper direction, of physical culture, with a judicious recognition of excellence where such recognition is justly merited—the paper par excellence of its order in America. What suggestions of the evening camp fire, the fragrant hemlock couch, the quieting after supper smoke, and the final "turn in," are depicted in the elegant frontispiece, the scene at the left being almost an exact representation of the camp ground of the "Black Fly Club" at Long Lake some years ago. A worthy club was the B. F. C., but the elements of cohesion were sadly wanting; the organization ceased to be.

Speaking about Long Lake calls to mind a funny episode, one of the many which befell "us boys" during the peregrinations in the Adirondacks, of the defunct but ever to be remembered "Black Fly Club."

While at Long Lake our "special artist" (C. R. F.) became suddenly afflicted with a jumping toothache while "bolting" his evening meal, (he always *did* "bolt" everything but the cabin door), and frantically demanded a "tooth carpenter." The dental craft being poorly represented in this section, he was advised to search his "dark box" for alcohol, to allay the distressing torment, but alas! none could be found. The ardent had run out when we were over on the Big Carry.

At this juncture one of the guides raised on his elbow and remarked that he "knewed a man they called Smith across the lake yonder that yanked 'em for the neighbors(?) off an on, an praps we ken find him to hum' an if he is, Mr. pieter man, (with a sly wink) 'he'll jerk yer ball-headed, or my name is'n't Steve Turner."

No sooner said than done. Steve and I were quickly at the oars, pulling with a will for the other side of the lake. In the stern of the boat sat the unfortunate sufferer, howling with pain and tearing his hair with desperation. In half an hour we ran alongside a rude landing, and looking toward the clearing espied a habitation and several signs of life, in the way of gaunt hounds and a thinly stocked farm yard. "Hello, there! Hello!" bawled our guide, and immediately there hove in sight the stalwart form of Smith.

"Here is a customer I've brought ye. Are you doin, any pullin' now days?" "Wall" said this God-send, "I haint looked down in the mouth to any alarmin' extent lately; but if you'll assist the gentleman into the house, praps I can relieve him; 'tall events I ken try, ye know—I allus bring suthin', that's one satisfaction I enjoy over them air city chaps—I'm powerful you see, an when I fix on a

mouth, as I said afore, suthin' er other's bound to come," and he laughed a fiendish laugh which would have crushed a less determined man than our afflicted friend.

"I don't like your style of 'bringing suthin'," said he. "It's all fun for you, but death to me." Got anything to take, Smith? I want a "stiffner," I don't care what it is, camphor or kerosene, any thing to give me great hopes, for my teeth come hard—most infernal hard."

Being accommodated with a "smile" from a flask which our professional friend carried, his courage came back, and prospects brightened. As we neared the house I espied, nearly buried in the sand, the remains of a huge horse's jaw. "Ah! thought I," here's a chance for a practical joke at our worthy artist's expense. I loosened the larger of the two remaining teeth, and placing the relic quietly in my pocket unseen, followed the trio into the "sittin' room." Once inside the Smith mansion, it was the work of a moment for the operator to find his "kit." The victim "occupied the chair" by being placed flat upon his back on the sanded floor. The strong arms of the guide held him firmly. Smith produced his "kit." Great heavens! a pair of bullet moulds as I live! (sixteen balls to the pound). "This is what I do it with," said the Dentist, "in argavated cases," as he tried to force the huge instrument into the artist's capacious orifice. His attempts to grapple with the raging fang were abortive.

"I'll hev to trim down the goom I reckon," so he cut around the tooth, and was preparing for another lunge with the tool, when his wife came to the rescue with an ancient instrument like a jack-screw—one long since discarded in the science of dentistry, but a thing of terrible power. Smith succeeded in fastening on with this concern and began to twist. He sweated, he wrenched, he swore. The patient struggled, howled, kicked, and kept up a series of half strangled yells which were distinctly heard at the camp. I stood trembling with fear, with clasped hands, wondered and prayed. All was of no avail, *the tooth would not succumb.*

The artist respite from what to him was worse than the tortures of the Inquisition, rolled in helpless agony upon the floor, upsetting sundry buckets, and causing consternation amongst the younger members of the Smith family. A mysterious jug was here produced, from which "Old Forceps" revived himself, and a nip was worried into the distracted victim. Again the "chair" was taken, strong arms once more bound him fast, the murderous instrument was attached, and the torture began anew. Smith's blood was up, his reputation was at stake. He was bound to win, and he did. This time victory perched on the dental banner. There was a crack, a crunch, an infernal howl, and then, the tooth was out.

If the artist was half crazed before the pulling, he certainly seemed quite beside himself now with joy at the denouement. The blood streamed from his lips, and with dishevelled hair, he appeared more like a maniac than the "Special Artist of the Black Fly Club." He embraced all in the room. He sang and shouted, "the tooth's out! Hurrah! the tooth's out! Bully for Smith! Smith let's have something! Where's the tooth?" Now, I had "fixed" the tooth which I had chosen to exhibit, and presenting it to him, remarked, that "as a toothist I thought he was a success."

The expression which burst over the features of the poor fellow I shall never forget—never. He spoke not a word. He was too full for utterance. Nonplussed for once—he strode from the house in the direction of the landing, Steve and myself following, convulsed with laughter. Once again in the boat, we soon drew up at our camp, where the party were awaiting the results of our visit to Smith's. The "Pieter man" suddenly revived his wonted fervor on the subject of dentistry, and leaped waist deep into the lake, shouting like a dervish as he scrambled up the bank, "the tooth's out, boys! the tooth's out! Three cheers for Smith, Hip! Hip!" A demand was made for the molar, not as actual proof, however, that such had been extracted, for there was every evidence that something had been done. The curiosity to see an artist's tooth drawn by Smith prevailed upon the possessor of the relic to pass it round, when it at once became the topic of much conjecture, as a matter of course.

One of the club having a scientific turn of mind, gave it as his opinion "that 'twas no human tooth, but evidently belonged to a herbivorous race, a horse perhaps; "and," said he, "I can discover minute portions of grass, which the animal was wont to masticate. The bewildered "special" sprang to his feet and declared the statement false, and without a shadow of truth. "I am a herbivorous animal, eh? I'm a horse, am I? and a masticator of herbs? That tooth, gentlemen, came with more than ordinary persuasion from this jaw of mine. I know, you see; I was there. That you have discovered traces of a grass diet thereon is nothing remarkable, in a scientific point of view; for in all probability that may be some of last year's lettuce."

This was too much, we could hold in no longer. We told our little story amid peals of laughter, in which the "sold" Photographer vociferously joined—avowing, however, that he would be "even with us," and as near as I can remember he was triumphantly successful while we were in camp on Big Tupper.

—A Zanzibar letter says that Dr. Livingstone's remains were exposed to the sun for a month to dry, and then packed in a hollowed tree, wrapped round with cloth, and the natives carrying it supposed it a bale of cloth, or kaniki.

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

PRACTICAL FISH CULTURE.

No. 5—THE HATCHING HOUSE.

THIS building is a necessity to one who makes a business of trout growing, or who intends to hatch ten thousand or more fish each year, but although not an expensive structure, still it is too costly for any one who only wishes to hatch a few thousand; and as all the works on fish culture describe the hatching of eggs in a well appointed building, a beginner, who is only inclined to try a thousand or two the first year by way of experiment to see if he can do it, and learn if the water is right, and see if all the various conditions required by the egg and embryo are to be found in his stream, naturally looks at the comparative cost of a building and the few eggs it is expected to develop, he then truthfully argues that he can buy his fish already hatched much cheaper than he can do it himself, and thus foregoes the satisfaction that one feels in watching his first batch of eggs quicken into life. The man of wealth can build a fine house and hatch his eggs regardless of cost, and while giving a description of a house with all the improved appliances for doing the work in a thorough and convenient manner we will also consider the wants of the man, say a farmer, who, having a spring, and from reading accounts of successes in fish culture, has, after much thought, concluded to risk ten dollars in an investment in trout spawn, but is not willing to go further at first in an enterprise so entirely new to him, and of which he has only the most vague ideas. He wants no house, and if he has read that one is indispensable he abandons the project as too costly an experiment for him.

There are several ways in which he may hatch his few dollars' worth of eggs at an outlay of a few cents. If he has five thousand eggs he can get three old well seasoned boards and make a trough six or eight feet long and a foot wide, close one end tight and put coarse wire at the outlet to keep out animals, put three or four strips across the bottom (inside) to hold the gravel, get fine gravel or coarse sand and wash it well and put in a layer of it half an inch deep, put the trough where a stream as large as a lead pencil can fall in at the upper end, and incline the trough so that the water just ripples over the strips, put your spawn on the gravel, cover it from light and animals, look at it every day to see that the flow is right, pick out the dead eggs, and let the others hatch. That is certainly not expensive, and may be made as effective as the most costly arrangements. If it is difficult to arrange a spout to fall into the trough as described, then cut a hole in the tight end and put a screen over it and let the water in that way, or get a piece of wire cloth one square foot for each thousand eggs, turn up the edges or tack it on a frame and set it in your spring, treat the wire with tar as will be described for Brackett's trays, let the frame come above the water and cover it with a board.

A house can be built for hatching very cheaply, as a light frame and rough boards will do; it need not be over six feet high at the eaves, and need have no up-stairs; plenty of light from all sides is desirable, as if it all comes from one side, then it is impossible to see eggs or fish on the shady side of the troughs. Skylights have been used, and although I have never seen them, I think they would be good.

The house on Honeoye falls is an old one that was built for a dwelling, and is 18x20 feet. This is a good size, as it will accommodate six troughs fifteen feet long and as many inches wide, placed by twos, with passage ways between, and leave five feet at the ends for table and tools. Having a good stone quarry on the place I may build a house of stone in a year or two.

If you want an office or work shop attached, have it outside, do not try to keep books, papers, microscope, or tools in the hatching house, as the dampness ruins everything; closets therefore are of little use. The arrangement of the details of a fish breeding establishment is of course different at different places, and subject to the will and judgment of the proprietor. Some have the commissary department in the hatching house, and a meat chest can be put up by the filter, but the chopping block, if in the house, should not rest on the floor, as the jar it occasions is bad for the eggs. At my own place I have a fine basement barn between the dwelling and the ponds, and the hatching house is beyond them, therefore the meat box and chopping block are located in the barn.

The size of the house should of course be governed by the amount of business that may at any future time be done upon the place, calculating that each square foot of trough should be allowed for each thousand eggs. This ratio, although great for the hatching, will be found none too much when the fish come to be fed in the same trough wherein they were hatched. We who take spawn, keep it until partly developed and then ship it or hatch it and sell the fish just before feeding, can put many more eggs in a trough than one should who hatches for himself alone.

The water supply should be plentiful, and if taken from the head of the spring is better than if procured lower down. A few months ago there was quite a controversy between Dr. Hetting, inspector of fish at Christina, Norway, and Professor Von der Wengen, in reference to the most desirable water for hatching the eggs of the salmon; the former recommending that it be taken from a point as near the origin of the spring as possible, while the latter insists that by so doing there will be a scarcity of air in the water which, as he says, will have a pernicious effect upon the young fish. He thinks that it is of the utmost importance that the water should previously traverse a considerable distance, and be more or less disturbed by falls and obstructions so as to absorb a large amount of air. Now

these learned disputants are both right. Water should be taken from the head of a spring, under ground if possible, so that it will be free from vegetable matter, conferva, &c., and should then, after being brought in pipes, be sufficiently aerated by falls in the hatching house. I once went to investigate the cause of fungus in a gentleman's hatching house who had followed directions implicitly, and found a dead horse on the slope that drained into his house supply! He had exchanged letters with him weekly all winter, but as he never mentioned the horse, I had tried to account for it in vain, but a glance at the situation revealed the cause, and a small ditch remedied it, but in the interim he had lost two hundred dollars worth of eggs. As for the material in which the water should be brought there is a variety of opinions, but all agree that iron pipe with its rust is a deadly poison; some like lead, others earthen, but never having had experience with anything but wood I can only speak positively of that. I had pine logs bored with an inch and a half bit, and the only fault I have ever found with them is that the bore is not large enough, for I did not then know that a pump log would not run full, neither will any other pipe. If you want a two-inch stream brought in wooden pipes two hundred or more feet with only a few feet pressure, have a three-inch pipe laid.

A lead pipe being smooth on the inside will carry more water than the roughly bored wooden ones. In pipes where the surface is as smooth as glass there is friction enough to retard the flow on the outside of the stream where it rubs the pipe, while in the centre it flows more rapidly. Practically, we find that two pipes, each one hundred feet long, one a two inch bore and the other only an inch, will not discharge streams in proportion to their diameters, but the larger one will convey nearly five times as much water as the smaller one. This is accounted for by supposing that both tubes retard the water by friction at equal distances from their inner surfaces, consequently the small pipe checks the flow more in proportion than the large one. Curves also check the flow, and if necessary to change the course of the pipe make them as long as possible.

I would prefer bringing the water a long distance if necessary rather than have the hatching house far from the dwelling; the nearer it is the oftener it will be visited, and when fry are to be fed in the troughs it makes a great difference whether it is only a few steps or several hundred.

The house should always be kept locked so that a chance visitor may not enter it without an attendant, for it is astonishing how people, otherwise orderly, have a desire to open and shut off cocks, take up a spoonful of eggs and throw them back as if they were gravel, and do other mischief without the slightest idea of any harm.

The upper end of the supply pipe should be placed in a box with screens of perforated zinc to prevent any moss gaining access to the pipe, or a frog may by accident get in and choke the pipe, and by thus cutting off the water do great damage.

The water should be received in the house in a filtering box. This should be built of plank and three or four feet long, twelve or eighteen inches wide, and as many deep. Here you can have screens of different degrees of fineness or none at all, as the water may be clear or otherwise. These screens have always been made to slide up and down, but might be made more effective if they were laid horizontally, and the water allowed to pass upward through them. Sediment would then settle in the box and not on the screen.

Two years ago I took out my screens as the water was very pure, and now have only a bag hanging over the spout to catch moss. The filter is large and sediment has a chance to deposit in it before it passes through, as there is a partition running the long way which makes the water go around the whole length of the box. It has plugs in the bottom by which to draw off the water in order to clean it. The water flows from this box into a distributing trough six inches square, which runs across the building, and to which the hatching troughs all head. This trough is pierced for wooden cider faucets, which supply the troughs. Some use a sliding gate, but both being of wood are objectionable. I have one brass cock which I like, but the wooden ones swell, stick and get dirty. The State house at Caledonia uses iron molasses faucets, and they rust, but perhaps might be coated with something that would prevent it. There is a faucet made of pewter that screws a cork up and down that might be just the thing.

The floor of the house should be well supported so that there is not the least spring to it, or the troughs can be supported on piles or piers of stone set in the ground and then only a walk will be required between the troughs; a floor is preferable, however, as tools may drop and be lost without one. If the troughs can be placed two or three feet above the floor they will be more convenient, and if there is plenty of fall from the supply reservoir to the house this can be easily done; it would also be advisable to let the water flow into a box or cask before entering the filter, and have little falls between the filter and the troughs. Flannel bags might be arranged to filter the water by hanging them on the cock at the head of each trough.

The flow of spring water will usually keep a house comfortable in winter without a stove, still one may be found necessary at times.

Our house stands over the large stream that supplies the ponds and is quite warm unless the wind blows through the old loose siding, in which case icicles hang wherever there is a drip, but we are hoping for a new one before long.

The troughs, trays, boxes, and all the inventions for hatching will be considered in another chapter.

FRED MATHER.

—The following act was introduced into the New York Legislature by Mr. McQueen, of Schenectady county, and referred to Committee on Ways and Means, March 17, 1874:

An act to authorize the construction of fishways in the Hudson and Mohawk rivers.

The people of the State of New York, represented in Senate and Assembly, do enact as follows:—

SEC. 1. That during the present year, one thousand eight hundred and seventy-four, it shall be the duty of the Commissioners of Fisheries for the State of New York to have constructed by contract with the lowest and best bidder or bidders, after due public notice, "Brewer's Improved Schute and Fishway" in the Troy dam in the Hudson river, and also one of the said improved schutes and fishways in the first dam in the Mohawk river below Schenectady, known as the aqueduct dam, or dam above the aqueduct, for which purpose the sum of fifteen thousand dollars, or so much thereof as may be necessary, is hereby appropri-

ated out of any money or moneys in the treasury not otherwise appropriated, which the treasurer shall pay on the draft of the said Commissioners from time to time as the work progresses and is completed.

SEC. 2. This act shall take effect immediately.

—A bill is before the Massachusetts Legislature, and reported favorably, to limit the close season for trout, land-locked-salmon, or lake trout, between the 20th of August and the 20th of March in each year.

—The State Fish Commissioners propose to establish a fish hatching and breeding conservatory near Montpelier. This movement necessitates the appointment of another Fish Commissioner.

—The first shad taken this year in the Delaware near Chester sold for five dollars.

—Congress has again appropriated \$15,000 for the use of Professor Baird, in the propagation of fish, in continuation of his most efficient exertions in that line.

—We have just had a practical illustration of the success attending fish-culture, in a box of fine trout sent us from the Richland Trout Farm, at Richland, Oswego County, New York. No wonder this farm is becoming a favorite resort for sportsmen, when to the interest of watching the adolescent development of *salmo fontinalis* is added the gastronomic pleasures of a table abundantly supplied with them.

—An Albany correspondent says:—"Mr. Geo. W. Dawson, of the Albany Journal, is attempting to start an individual culturists' association; ten gentlemen to put in \$500 each and stock the streams and lakes in the North Woods with trout. He has been very successful so far. All the sportsmen here are very bitter against Seth Green for favoring the stocking of these lakes with pickerel, as they say it will strip them entirely of what few trout there are left. They talk very earnestly on the subject. There is no fishing club here. One boat club, the 'Mutual' and one social, the 'Albany.'"

—The Great Falls and the Little Falls of the Potomac are becoming such favorite resorts for anglers that it is proposed to place an excursion horse boat on the river to run between the Falls and Georgetown at least three times a week. Messrs. Garrett & Maus keep the Crumelin House at the Falls, which is a good hotel. We shall notify our readers as soon as the bass fishing begins.

Woodland, Lawn and Garden.

HOT BEDS—AND PLANTING OF FLOWER SEEDS.

"It comes the herald of hosts,
Of blooms that will not fail,
When summer from some southern coast
Shall call the nightingale."

IN our last paper upon flower planting in the spring we spoke of the first operation—the forcing, or hot bed. We showed our friends how to make a large or small bed, and all the necessary work required until the coming up of their seed. We left their seed hot bed well supplied with small seed plants, some of which are just developing the second leaf, and some of them the third and fourth leaf, all green, and very thrifty. Now is the time to give the plants particular care. They require light, heat, and air. You can keep your plants in the bed and increase their size, and by giving air and water you can grow them thrifty and stocky, good strong plants always being desirable for the future garden. Many seed often having shown the cotoledons, or seed leaves, need transplanting either in pots or into the earth. Plants potted may be kept under the frame until quite large, and if well watered will, when set in the garden, make the most rapid growth. Potted plants thus treated do not require so much heat as at first starting, a very gentle heat being amply sufficient to carry them forward with good results. When the plants are getting large, if intended for outdoor culture, and if you would have a fine show of flowers, you will accustom your plants to bear as much of the open air as you can, say half of every good fair day, by partially raising your glass and letting in the air until towards night, when you will secure them from cold in the usual manner by covering up your glasses. The object of the florist should be to produce as strong and vigorous plants for the garden as is possible, and to give them air by this hardening process before throwing them into open ground.

You now in regular course of garden flower culture come to the transplanting operation, or the making up of your ornamental flower ground. Having arranged your future ground by fixing upon the size and form of your garden plat, you will look at the removal of your plants from the bed to the garden as an operation requiring only care to be attended with success. You should always give the plants to be removed a gentle watering, and with a trowel take up the same with care and place them where they are to stand for future growth. Remove a very generous share of the earth in which your plants have grown if you would have them go along and not stop their growth. I always try to have my plants handled so carefully that they do not know that they have been moved at all. Never water after transplanting. Plants like men can be drowned, and to shower many of our tender plants with cold water immediately after planting is often the surest way to kill them. Therefore we prefer always to transplant at evening to any other time. If after transplanting some of the more tender kinds you notice next day an inclination to wilt, you can shade them for an hour or two from the hot sun with a paper on frames, or the like, but generally one or two sprinklings at evenings will be all you require. Never in

any case water plants in the middle of the day in the hot sun. A few plants require much water, and of these we shall speak in their order and place. Ladies, be careful not to be too generous with water; although a valuable element in the raising of choice flowers, it is nevertheless a very active appliance of destruction when injudiciously used.

Having carried you through the first requisites of raising your plants, and transplanting the same to your city or country garden, you can now raise them to blossoming and final development as well as ourself, if you are only watchful and give due need to our formula. THE FOREST AND STREAM, upon the whole subject of gardening, flowers, bulbs, the ornamental and unique, will, we trust, be found a reliable, safe, and true teacher of this delightful art. We would make it an authority upon all these subjects second to none, and always "full to the brim" with just such subjects that shall interest our lady readers as well as gentlemen. In our next we shall speak of forms of gardens for our cities, and particular effects, of arrangements of flowers, in a manner both popular and practical.

OLLIPOD QUILL.

THE DESTRUCTION OF OUR FORESTS.—A few facts will impress our readers with the necessity of prompt action in their own behalf in reference to the economical use of their pine forests far more than columns of theory, probabilities and guess work as to the amount of pine timber now standing. Thirty years ago in the valley of the Genesee, New York, village merchants were in the habit of receiving pine lumber from customers at the rate of \$5 per thousand feet, and giving therefor "store pay" as value received. To-day, in some portions of the Genesee valley, there are a few acres of pine yet standing, and single trees are worth from fifty to one hundred dollars as they stand. The present development of the west is as rapid, proportionately, as that of the east has been during the past thirty years. Owners of pine land in the west have been anxious to realize the greatest immediate profit from their valuable acres rather than adopt measures whereby a reasonable return would result from labor and investment, and at the same time fully utilize the timber cut.—*Wisconsin Lumberman.*

Natural History.

OUR PETRELS.

OF the three species of petrels, stormy, or Mother Carey's chicken, (*Procellaria pelagica*;) Leache's, (*Thalassidroma leachii*;) and Wilson's, (*T. Wilsoni*;) found on our coast, only one of them can be said to be a native. Leache's is a common summer visitor and breeds. Its most southern breeding places I believe are the islands in and around Casco Bay on the coast of Maine, although formerly it was found much further south. It is quite common here and continues to increase northward, being found abundantly in and around Grand Manan in the Bay of Fundy. The other two species are not often seen on the coast before the last of August or first of September, when all three are found associating together. On the 16th of last July I made my first collecting trip to what is called "Junk of Pork Island," about three miles north-east of Peake's Island, in Casco Bay. The island has an area of half an acre at low water, and in the centre, is an almost perpendicular piece of rock about forty feet in diameter and nearly twenty-five feet high. On this rock were found breeding Leache's petrel, Wilson's tern, (*Sterna hirundo*;) arctic tern, (*Sterna macroura*;) and the spotted sandpiper, (*Tringoides macularius*.) In the earth which covered this rock for about a foot in depth, were found over a dozen nests and eggs of this petrel; this being probably the second brood, the nests having no doubt been robbed before. The nest is made in a hole excavated by these birds, which is usually from two to three feet in length and about six inches in depth. The nest is placed at the end, slightly raised above the level of the hole and consists of only a few grasses, sticks and some feathers very loosely put together. On this is laid the single egg which is white, dotted at the larger end with a few reddish spots, sometimes forming a circle. The ground color of the egg is however almost always stained by the earth in which the nest is placed. The females, but rarely both male and female, were found on the nests before the eggs were hatched, but after the young have appeared they are usually off in search of food and feed the young at night. They evince no great desire to escape when their homes are invaded. When freed on the ground they are compelled to run to the edge of a cliff or descent where they can throw themselves off, for it is impossible for them to take wing from a level. Their movements are very graceful when on the wing and they seem literally to walk on the water as they fly about, just touching the tops of the waves with their feet, and when rising from the water it is necessary for them to get on the crest of a wave in order to take wing. They pick up all the greasy and oily substances they can find, which constitute the greater part of their food. I have spoken of the gracefulness of their motions, but what can exceed the beautiful motions of the terns, with their forked tails and pointed wings! Now darting down after some luckless fish; now chasing each other, or hovering over some companion or friend who has been shot, little thinking what their sympathy will cost them.

The petrels are the cause of a great deal of superstition among seamen, and it would be hard to get a true sailor to kill one. When met with, far out at sea, they are considered sure precursors of a storm, and it is believed that when a man is lost at sea his soul immediately enters one of these birds and then roams over the broad ocean before it can reach the "Fiddlers' Green" or "Sailors' Paradise," as in Virgil, Æneas speaks of the souls of the unbred dead wandering aimlessly about the shores of the Styx, vainly endeavoring to induce Charon to ferry them over. A sea Captain once told me that he believed this as his religion,

and would as soon think of shooting a man as to shoot one of these birds. Dire misfortune is said to follow the destruction of one of these birds, and as the writer met with an accident in falling into the hatchway of the "Blue Light," the sailors said it was because he had killed one of them.

The petrel, especially referred to, is the Mother Carey's Chicken, (*Procellaria pelagica*), although the others are continually confounded with it and called by the same name. A word to collectors in regard to the petrels. When one is taken from the nest it ejects an oily secretion, and when killed, this will ooze out and soil the plumage very badly. The only remedy I have found was to stuff the mouth, throat and nostrils full of cotton, renewing frequently, and to be very careful to keep them with the heads up. When once stained the oil may be removed by carefully washing in benzine and afterwards with water and soap.

FRANKLIN BENNER.

For Forest and Stream.

THE WESTERN LARK—*Strunella Neglecta*.

THIS species of lark so nearly resembles the eastern meadow lark, (*S. magna*), that it is almost impossible to tell them apart. Baird says: "the same description as to size, pattern, colors, &c., will apply almost equally well to both. It may be stated that the real difference lies in the greater tendency to narrow transverse bands on the upper surfaces, especially of the middle tail feathers."

But its notes are so very different that even those that seldom notice such things, can tell the difference at once. Its notes are clear and somewhat like a blackbird's whistle; and when sitting on a tree or weed, it will "chirp" almost exactly like one. Sometimes it "chirps" while flying. Its song, proper, varies somewhat in each individual, being a succession of a half a dozen or so clear whistle-like notes. Then it has another song not so often heard. This is something like the syllables: "Which-it-ty," rapidly uttered; the bird at the time generally sitting on a weed. Its habits appear to be nearly the same as those of the meadow lark. It is very abundant here, and the prairies are now, (the last of March,) musical with their songs. Habitat, Western America from the Plains to the Pacific. F. S. B. Russell County, Kansas.

—The Germantown Telegraph says:—They are still discussing the question in some places whether or not the European sparrow will protect city trees from the worms, &c. These people seem to learn nothing. The sparrow is no more insectivorous than some of our own sparrows, the catbird, robin, &c., and nothing to compare to the nut-hatches. They prefer seeds even in summer to all other food. We have a colony of them on our premises and know something about them.

POWDER-DOWN.

WASHINGTON, D. C., March 27, 1874.

EDITOR FOREST AND STREAM:—

I note, in your paper and elsewhere, various surmises and inquiries respecting the so-called "Heron's Torch" or "luminous spot" on the breast of birds of that tribe. Your correspondent "Homo" has the facts in the case most nearly. It is perfectly clear to what the appearance is due, and I had supposed it was pretty well known. All herons (and a few other birds) have a particular kind of feathers called "powder-down" which occasion the phenomenon. These down feathers are a matted patch of yellowish or whitish color, concealed beneath the ordinary plumage. They are weak, imperfect feathers, without strength to stand straight, which grow continually and as constantly break down, with a scurfy exfoliation, and pervaded with a greasy exudation. In most herons there is not only one such patch of powder-down on the breast, but four others, in pairs; one pair on the lower back over the hips and another pair on the lower belly under the hips. The bitterns lack the belly patches; but the whole set will be found in the "poke" and other typical herons. A tropical American species—the boat-billed heron—has still another pair over the shoulder blades. I never observed the degree of luminosity these feathers possess; but according to accounts it is very decided—more than can be accounted for on the supposition that it is merely a sheen or reflection of light from a greasy surface. "Homo's" experiments in a darkened room would seem to prove this, but I am not prepared to say that there is a true "phosphorescent" quality in the feathers, like that possessed by a fire-fly, though this may be quite true.

The physiological function of the powder down is uncertain; but it is not likely that it is of service to the bird in catching fish, for the reason that most herons feed by day, and do not go a-fishing at night with or without a "lantern." Yours truly, ELLIOTT COUES.

THE QUAIL QUESTION.

NEW HAVEN, March 26, 1874.

EDITOR FOREST AND STREAM:—

In your paper of this date you publish a letter from "Pioneer," in which he states that, in his opinion, a setting quail emits no scent. With all due respect to his opinion, I would say that in my judgment he is in error. Last fall, while hunting in a dead swamp, my pointer came to a stand near the trunk of a tree. On approaching the spot I could distinctly see a quail crouched down in the smallest space possible, under the shadow of the log. The quail may have been moving about previously, as they—the coveys—were scattered about when I came upon them, but that the dog was pointing a setting quail, and that, too, by the scent, is undisputable. "SHOOTIST."

ZOOLOGICAL SOCIETY OF PHILADELPHIA.—We are in receipt of the following interesting letter from Dr. John L. Le Conte, the Secretary of the Philadelphia Zoological Society. We have not the least doubt of the success of this enterprise, and believe that in a few years Philadelphia will boast of the finest collection of animals in America:—

ZOOLOGICAL SOCIETY OF PHILADELPHIA,
35 South Third Street, March 30, 1874. }

EDITOR FOREST AND STREAM:—

We are progressing rapidly in our arrangements at the Zoo. The monkey house is nearly completed, and the bear pit in an advanced stage of construction. Other buildings are under discussion, or in more or less forward condition. The prairie dog village is happy under the same municipal regulations which prevail on the western plains, with the advantage that the inhabitants are free from the assaults of their "dangerous classes," the owls and rattlesnakes. A large increase to the population of this thriving colony may therefore soon be expected.

A large consignment of Australian marsupials and birds is now on its way and will arrive at San Francisco in a few weeks. The collection is in charge of a competent keeper, and will be brought to this city by railway without delay. An additional part of our ground will soon be added to our present enclosure, and work will be pushed on as rapidly as possible. We hope to have the garden opened by the beginning of June with a very interesting series of animals, many species of which will be for the first time exhibited alive on this continent.

I will send your note to the office in order that more minute details may be given you concerning the animals now in the garden, and to arrive, with such other information as will interest your readers.

Financially, we are in a very fair condition, and I think as soon as we can open the garden and show to the community what we have actually accomplished by the prudent and economical expenditure of the money confided to us, that the interest felt in our enterprise will be greatly increased.

I thank you greatly, in the name of the Society, for the friendly sympathy which you give us in our endeavor to introduce into the United States the European system of Zoological Gardens, which have proved so valuable for both scientific and social progress.

Very truly yours,

JOHN L. LE CONTE,
Cor. Sec., U. S.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, }
NEW YORK, April 4, 1874. }

Animals received at Central Park Menagerie for the week ending April 3, 1874:

One red-backed Pelican, *Pelecanus rufescens*. Hab. West Africa.
One small Alligator. Presented by Master Theodore Roosevelt.
One Gray Squirrel. Presented by Miss Mary Valentine.

W. A. CONKLIN.

The Kennel.

—As so many of our subscribers and correspondents have written to us asking for a portrait of "Belle" "in action," or in other words, "standing on a point," we wrote to her owner, Mr. Price, of England, requesting him to send us a large photograph of Belle in position. Last week he kindly forwarded to us a beautiful illustration of this wonderful pointer, which we have reproduced in our journal to-day. It will not be necessary to enter into any elaborate description of this remarkable animal, as most of our field sportsmen are familiar with the performances of Belle at field trials in England, so that we simply give her pedigree and some of her triumphs.

THE IRISH SETTER.

THE red Irish setter and his descendants have been a favorite breed with our field sportsmen for the past twenty years. It will not be uninteresting to those who have adopted this blood, and those who are seeking for purity in this animal to give the following article, written by an Irish gentleman in *Bells' Life*. This sportsman and breeder has been engaged for many years in noticing the different strains of this dog, and speaks in high praise of the red setter proper, but gives the palm to the blood red and white setter of Ireland:—

Sir—I divide the second species into two classes, viz., the dark red and the tan red, first-class or dark red being the purer in blood and color; but both of these classes being inferior in breeding, blood, size, lineage, beauty, feathers, depth of chest, endurance, shining skin, blood red coat, and enormous spring power. Color of dark red (no white), class 1, second species:—The dark red is produced in the following manner:—About a century ago the dark red was crossed by the black setter, Lord Ossulton's breed (now the Earl of Tankerville,) and a good breed it was, of medium size, and imported into Ireland for the above purpose. The cross did not suit, as often seen in the offspring, frequently in the present day, for you often see two different breeds of setters far removed and a bad progeny produced by crossing, even with good blood on both sides. The writer has tested this by long experience in breeding. The red in the above species is not blood red; it is darker, and has at times peculiar tinges of black, especially at tip of the ears, and mingled about the head and back, sometimes the same at muzzle, also the dorsal and lumbar region, tip of tail, and isolated hair of dark color mingled through the entire red hair. The hair is stronger, coarser, and shorter, with little gloss; curls are often seen about the tail, posterior part of ear, and about the gluteal and scapular muscles, which show great impurity of blood; the color of the eyes is dark, lips likewise, and also the tip and cartilaginous portion of nose; mouth black, not barred; the hair is not feathered in the same degree as you see in the blood-red and white Irish setter; the hair on the posterior portion of fore legs is often tinged with black; very little hair between toes or covering the anterior phalanges of the feet. The formation of the red Irish setter without white is peculiar. The entire dog, taken collectively, is more squarely built than the blood red and white Irish setters, marked less with curved lines. The pure reds are leggy; taken collectively, the loins are round, strong in the extremities, but not so angular as in the blood red and white Irish setter. The back is longer also in many, and why? On account of the want of obliquity in shoulder blades and pelvic portion of the hind quarters. This has been produced by bad crossing. This dog is, notwithstanding, of a hardy nature. The chest, or thorax, is barrel-shaped, but not deep anteriorly or below, and wider between the forelegs. This impedes freedom of action, want of pace, and engenders foundering when they are trained for some time for sporting purposes on the tammocks, in mountains or uneven grounds, after the pursuit of game, etc., as you often see this disease exhibited in the large size pointer class with heavy heads and necks, wide chests, heavy bodies, their legs not being able to carry their weight. The elbow is essential, impeding pace, etc., and the want of endurance, as far as the extremities are concerned. The perceptive faculties in this dog are not so strong, the ears are set higher, and not so placed posteriorly as in the blood red and white, and therefore there is not the rotundity of head; the curve line from the posterior portion of the head is not so convex towards the first dorsal vertebra as you see in that superb animal of the first species, the blood red and white. There is more lip, and the angle of the lips to the nose is more blunt, and less acute. The difference of temper is much at variance. The pure red is uncertain, more irascible, easily provoked, less under control, and impetuous. On the contrary, the blood red and whites have courage without ferocity, amiability of temper, great love of their master, docile, more under control; the senses are better developed, the intellectual, moral, sensitive, perceptive organs are very highly organized, and the faithfulness of the blood red and white is wonderful in the extreme; in

fact, there is no dog of any class to be compared in beauty, elegance, formation, scent or action in the field or moors with the Irish blood red and white setter.

—Who carries the mail through from Two Woods Lake in Dakota to the Minnesota line? It is over a rough country, and when the snows are deep it is terrible hard work. Who does it? Why "Curly," a fair sized spaniel. The mail is put up in a tight package, bound in an oil silk wrap, and tied around Curly's neck, and off he sets on his journey full tilt. Some office seekers in the Territory are already intriguing for the position. What salary Mr. Cresswell pays Curly is not known. All we know is that for the present Curly is satisfied with a good dinner, and will never start on the return trip until he has had it.

POINTER AND SETTER MATCH.

NEW YORK, April 8, 1874.

EDITOR FOREST AND STREAM:—

I have taken a great deal of interest in the subject of the international pointer and setter match, which was originated in the FOREST AND STREAM. As you have frequently done me the honor of allowing me to present myself to your readers as one who has a strong liking and some little knowledge of these subjects, and have published my letters, I trust you will permit me to give you some ideas of mine in regard to this international match. I agree with you perfectly when you state that it would be useless for any of us, even with the best of dogs, to take our animals to England to engage in a match there. English dogs, and I speak knowingly, having shot three seasons there, are better trained than ours, are handled so dexterously, and are under such perfect control, that unless our own pointers and setters had some particular redeeming traits, which would entitle them to marks of merit, the English dogs would claim all the points. Therefore, as you have, I think, suggested, if our dogs went there their wonderful retrieving qualities should be noticed. Perhaps it may be worth while right here to give you some account, or rather let our English friends know how far this retrieving quality is carried by some of our own dogs. I know of a dog, and I fancy you are acquainted with his performances, who pointed, killed, and retrieved sixteen single English or Wilson snipe in two hours. His bearing in the field is wonderful, and he requires scarcely a single word of command. With the dog, gun, and man ready, at the word "lie on," the dog ranges and points. The gunner walks up, flushes the snipe, kills, the dog drops instantly, and at the word "fetch" the dog retrieves the snipe without injuring a feather, and absolutely hands it to his master, and then, without another word spoken returns to heel, and so on over and over again. This was accompanied sixteen times hand running, without any signals or any other words than the two commands of "lie on" and "fetch." It is necessary that the ground should be described. It was marshy meadows, covered here and there with brush and grass, the shooting open, and a good scenting day. It is not to be supposed, however, that a dog of this character can be found every day—he is rather an exception; but what I do wish to convey is this idea, that the performance of the animal I have endeavored to describe is, in my opinion, fully entitled to quite as many points as Mr. Price's "Belle," although the style of the American dog may not be as faultless. We would now like to ask of our English sportsmen what they think of a single setter, combining all these marks of excellence, who can in addition retrieve. Believing that our English friends are thoroughly in earnest, with a love for fair play, and that a match of the character they propose is suggested solely by their desire to enhance true sport, I would suggest their bringing some of their dogs to this country. If you could induce some of them, Mr. Editor, to bring over a brace or so of their 97½ point dogs I could easily make a match, and guarantee to find ten gentlemen who would each enter their dogs to work over quail or pinated grouse (prairie chickens), the first to be hunted in October and the latter in September. I would suggest a sweepstakes, with an entrance fee of not more than \$100 each. I would leave the appointment of one of the judges and the locality to the editor of your very reliable paper.

Very truly,

C. B.

DOG SHOWS AND FIELD TRIALS.

EDITOR FOREST AND STREAM:—

Nothing would greater tend to improve our breeds of American setters and pointers than a series of exhibitions of sporting dogs, under the direct supervision of the leading sporting clubs of the United States, when prizes should be awarded for the best bred animals of different ages and sex in both classes, to be followed by regular field trials, arranged to a code of rules agreed upon, and premiums given likewise for the best broken setters and pointers. Such shows and field trials, if controlled by gentlemen sportsmen and judges of undoubted integrity, would not fail to be a success and self-supporting.

Too little attention has been paid to the breeding and pedigrees of sporting dogs by Americans. Why should it be that all our fine setters and pointers must be imported? Simply because the best blood is obtainable in Great Britain, and there is no denying it. And why is it that the sportsman who upholds the American setter as better than the English one when asked the pedigree of his animal (although he has an imperfect knowledge of his dog's descent) will, nine times out of ten, reply "His grandfather came from England or Ireland."

A dog show alone is not calculated to have the benefit desired; it should be followed by a field exhibition, for there are many setters and pointers that would take first and second premiums in doors, but when in the open would be at the bottom of the list.

The London Field says, in an article on dog shows: "Granting that exhibitions of this kind are not at all times pure, any more than the turf is pure; granting that the judging is often faulty, and that in some bribery and corruption undermine merit, still, with all their failings, it must be admitted that these exhibitions have gone far towards attaining the objects for which they were originally started, viz.: improvement in the breed of the dogs of the British Islands, and the diffusion among the people generally of the knowledge of good dogs."

Could not you, Mr. Editor, devise some plan and make it known through the columns of your admirable and fast-growing journal, so as to bring this subject before our American sportsmen's clubs? We are sadly in want of a system in breeding and breaking of sporting dogs, and I feel confident dog shows, coupled with field trials, would greatly improve our stock.

—For the last two years, the chimpanzee in the London Zoological Gardens, has been an endless source of instruction and amusement. He died in the early part of last month, of acute tuberculosis of the peritoneum, though the lungs were found to be perfectly healthy.

The Horse and the Course.

—Fast driving has become such a dangerous practice in Central Park that President Wales has invoked the aid of the police, the police-magistrates, and the press, to stop it.

—The Selma Exposition Jockey Club races commenced on April 2d. The first, a hurdle race, one and a half miles, was won by Chief Engineer, beating Fireball, second, Joe Johnston third, and Nashville Harry fourth. Time—3:19½. The second race, a half mile dash, was won by Lucretia, beating Vandelite, second, and Belle of Australia third. Time—54 seconds. The third race, mile heats, best two in three, was won by Bessie Lee, beating Tabitha, second; Lucy and Fanny were distanced. Four heats were run. Time—1:53½, 1:53½, 1:53½, 1:53½. On April 4th, the first race was a hurdle, one mile, over four hurdles, and was won by Nashville Harry, Fireball second. Time, 2:11½. The second race was won by Quits, Belle of Australia second—Time, 54½. The third race was a mile dash, and was won by Tabitha, Revenge second—Time, 1:50½.

—At Oakland Park, San Francisco, April 3d, the California mare Lady Mac made what is said to be the best time on record in a five mile trotting race. She trotted against Jerome and Omaha. She sold in the pools at \$2 against their \$20 and \$60 respectively, and won the race—Time thirteen minutes. On April 4th, the great twenty mile trotting match at Oakland Park between Mattie Howard and John Stewart was won by the latter in fifty-nine minutes and three seconds. Howard was almost neck and neck with Stewart at the close. During the most of the race Howard was ahead from six to ten lengths, but was finally beaten.

—The Louisiana Jockey Club will hold their spring meeting on April 11th, and five following days. The entries are largely in excess of previous years, and representatives from the best stables of the south and west are making grand preparations to revive the old form of this celebrated Southern Club. Among the prominent events will be the Pickwick stake for three-years-olds, with thirty-two entries; the Louisiana stake for four-year-olds, with eighteen entries, and the Fortuna stake for three-year-olds, with thirty-two entries.

CONFIDENCE IN ANIMALS.—In an admirable article on this subject the New England *Farmer* says:—

Horses and oxen should have such confidence in their drivers, that they will willingly and repeatedly make all reasonable effort to do as they are bidden. A team should never be told the second time to start an unreasonable load. We don't believe a horse would ever become balky if it were never misused by overloading and whipping. It is our best horses, those that are full of spirit and spunk, that get balky, and not the "lunkheads," that don't know enough to know when they are misused. What is it but a feeling of confidence that makes the patient horse stand for hours in harness, unhitched, waiting the return of his master to give him the word to go, before he will leave his tracks? And what is it but this same confidence in his master, that makes a well trained horse willing to be driven over uncertain places, across shaking, dilapidated bridges, and up to noisy, pokerish looking locomotives, with their puffing smoke-stacks and screaming whistles?

Rational Pastimes.

Will our University correspondents kindly send us their most recent catalogues.

—A meeting of the St. George's Club was held at Sutherland's, on Monday, April 6, when there was a large attendance of members, and much enthusiasm was displayed. The ground at Eighth Street, Hoboken, has been secured for the season, and is being prepared for play. The club has engaged John Whelan, of Sheffield, as its professional. He was formerly a famous amateur athlete in England, and is an excellent cricketer. A large number of new members were proposed for election, and we are glad to note that many of the old members who had left in past years from various reasons are returning to the club. It will have a very strong eleven this season, and in better form than last year. The season will be a very active one, as, in addition to the usual games with the Philadelphia clubs, matches will be played with the Boston and Athletic Baseball Clubs, previous to their departure to England in July. Matches are being also arranged with the Boston, Toronto, Syracuse, and other clubs.

—The leading cricket clubs of Philadelphia met at dinner at the Reform Club on April 6th. J. Dickinson Sergeant, Esq., presided. The following toasts were announced, viz.: "The Cricket Season, 1874," responded to by Mr. Outerbridge; "The Philadelphia Cricket Club," responded to by Mr. Patterson; "The Germantown Cricket Club," responded to by Mr. Cadwalader; "The Young American Cricket Club," responded to by Mr. Newhall; "The Merion Cricket Club," responded to by Mr. Montgomery; "The Veterans," responded to by Mr. Wister; and "The Juniors," responded to by a cricket song. Mr. A. A. Outerbridge, in the course of his remarks, said that there was every reason to anticipate an active and successful season. The four leading clubs represented here this evening are all in flourishing condition; and it is most encouraging to know that the former champion, the Young America Club, will this year share with the Philadelphia and Germantown clubs the magnificent cricket grounds at Germantown. The Merion will make a bold push for the front rank this year, and the older clubs will have to look after their laurels. The playing season will be opened at the Germantown

ground on Saturday, the 18th of April inst., by a scrub match between the members of the three ground clubs—the Philadelphia, Germantown, and Young America. Club matches, of which several have been already arranged, will follow on nearly every succeeding Saturday, but the first excitement of the season will be the cricket fete on Thursday, May 28. In addition to the cricket match, which, it is expected, will be between a visiting eleven from Savannah, Ga. (composed chiefly of English gentlemen resident there), and a Philadelphia eleven, the features of archery, croquet and dancing will be included.

—There will be a cricket tournament held at Halifax N. S., in August, when international matches will be played. Captain Wallace, 60th Rifles, is arranging the preliminaries. There is some talk of another amateur eleven coming from England this year. The season is expected to open about 1st May. There will be another meeting of the St. George's Cricket Club, on Saturday, 18th April, after which the annual dinner will be given at Sutherland's. The secretary's address is 88 Wall Street, room 3, and P. O., box 922.

—There is to be a special meeting of the Amateur National Association, held at room 41, Astor House, at 5 p.m. on Wednesday, April 23.

—The Mutuals opened play on the Capitoline Grounds, April 4, in a practice game with the Concord. The score was 19 to 4. The cold weather obliged a suspension of play at the close of the fourth innings. The Mutuals will present a nine, including Allison, C. Mathews, P. Start, 1st base; Nelson, 2nd base; Burdock, 3rd base; Carey, ss.; Hatfield, lf.; Remsen, cf.; and Higham, rf.; with Patterson as sub.

—The Montague and Powhattan clubs played their first match together on April 3rd, at the Capitoline Grounds, when the latter won easily by a score of 28 to 15. It was a cold day, and skilful play was almost impossible.

—The Arlington Club, of New York, having no field to play on, have engaged one day on the Capitoline Grounds, Brooklyn, when the Chelseas, Montague's, Concorde, Davis and Powhattan Clubs are to play.

—The veteran Knickerbocker Club inaugurated their thirtieth season at Hoboken this week, commencing Tuesday, April 7th, and will play again on Friday, the 10th. They have played ball regularly at Hoboken for the past thirty years, never missing a season; and they were never stronger either financially, socially, or in playing strength than they are now. They will play under the ten-men rule, as they are the pioneer club in encouraging all improvements in the game.

—The Boston Club opened play on their grounds on Fast-day, April 2nd, on which occasion fully three thousand people were gathered to see the champions take the field against a very strong nine of players of the Boston Beacon and Somerset Clubs. The score stood at 10 to 8 only, the champions having to fight hard for victory. Their nine is M'Vey, C. Spalding, P. O'Rourke, 1st base; Barnes, 2nd base; Schaper, 3rd base; George Wright, ss.; Leonard, lf.; H. Wright, cf.; Hall, rf.; with Beals and White as subs.

—The representatives of four colleges, Harvard, Yale, Amherst and Bowdoin, met at Springfield, Mass., on April 4th, for the purpose of arranging a college freshman base ball tournament, and decided to hold it on the Union Grounds, Boston. The date was not fixed, but it will probably be in the last week in June. The contest will be for the freshman championship of the country.

The Staten Island Cricket and Baseball Club met at Weiner's Hotel, Tompkinsville, Staten Island, on Tuesday evening last, and elected directors and officers for the coming season.

—Messrs. A. Garnier and Maurice Daily played the third billiard match for the championship cup and \$2,000 on April 3rd. The hall was well filled and play commenced about quarter past eight. The game was not only one of the most interesting ever played, but one of the quickest, the time occupied in playing the 600 points was only three hours and eighteen minutes. Garnier was in wonderful form as his average in the last 400 points was 21. The winners average was 12.36-47. His best runs were 15, 31, 43, 15, 56, 15, 75, 40, 23, 17, 35, 60, 29, 24, 23.

Daly's best runs were 12, 31, 43, 19, 47, 62, 51. 22. Daly's total score was 380. There were no misses and no safety plays.

—Sportsmen find an agreeable abiding place in Texas. On the prairies almost every kind of wild animals abound. In the north west are the wild horse, or mustang, and the buffalo. The deer, the antelope, and the mountain goat, are plentiful, not to mention the jaguars, the pumas, wild-cats, black bears, ocelots, wolves, and foxes, and such smaller game as peccaries, oposums, raccoons, hares, rabbits, and squirrels. A special feature of wild life is the prairie dog or marmot, dwelling in holes burrowed in the ground. Their numbers are so great that the traveler may sometimes journey for days together without losing sight of them. The feathered tribe are also abundant, including birds of prey and birds of sport. There is the bald-headed eagle and the Mexican eagle, vultures, owls, hawks, wild turkeys, wild geese, prairie hens, canvas-back and other ducks, teal, brant, plovers, quail, grouse, woodcocks, pigeons, partridges, snipe, plovers, red birds and turtle doves. By the waters are also found the crane, swan, the pelican, the water turkey and the kingfisher. The smaller birds are numerous, and among them many of the most brilliant plumage, as the oriole, the parouquet, the cardinal, the whippoorwill and the sweet-toned mocking bird. Black birds abound, and woodpeckers, bluejays, starlings, red birds, swallows, martens, and wrens. In the rivers and bays there are all the varieties of water-life, from alligators to perch, pike trout, green turtles and oysters.

Answers To Correspondents.

We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, traits, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.

PLANKERS, Hudson, N. Y.—Arnoldy, Saddler, Newtown, L. I.

QUAIL EGGS.—Do not know where fresh quail eggs can be had. Would advise parties to purchase live birds.

EDWARD L., Lockport, N. Y.—Where can I obtain a pair of ferrets, male and female? Ans. Of Fred Mather, Honeoye Falls, N. Y.

H. A. L., Alleghany, Penn.—What kind of rod and reel is suitable for the Ohio and Monongahela Rivers? Ans. A 12 foot ash and lance wood rod with a reel to hold 25 yards line.

A. P. BOSCOBEL, Wisconsin.—What places in Europe is fish culture practiced, either by private individuals or Government? Ans. Stormont-field, Hunningae and other smaller ones.

EXCELSIOR, St. Louis.—The answer about the price of the Laverack setters was omitted last week. The price per pair for puppies is 20 guineas; for a pair of dogs, 50 guineas.

C. A. B., Greenville, Mich.—The Hazard powder best adapted for a 12 gauge breech-loader would be No. 3. The book you would want would be Stonehenge "Shot Gun and Rifle."

C. H. H., St. Johns, N. B.—Can you inform me where I can procure a small-sized black and tan terrier pup eight months old, thoroughbred, and at what price? Ans. Perhaps some of our correspondents have one for sale. They can apply to this office for your full name.

H. R. Y., Nassau street, City.—Full information in regard to the International match may be had from F. P. Fairbanks, Esq., Secretary Amateur Rifle Club, Broadway, City. The club is anxious only to secure the best shots, no matter where they come from. We should like to see Alabama and Louisiana represented.

DANBURY.—What sort of fish and fishing can be had in Harlem River and Hell Gate in April and May, and where can a good guide and boatman be obtained? Trolling for bass with rods is good at these points in May, and one of the best men to put you on good fishing ground is John Hilliker, Yorkville, Eighty-eighth street.

SUBSCRIBER.—I would like to get a collection of the different varieties of birds, merely for ornament. Would it be against the law to shoot a bird out of season in such an instance, and could the taxidermist report me if I should bring a bird for him to mount out of season? Ans. You have a right to shoot birds for scientific purposes, and the game laws of many States contain a special clause giving such right.

M. R. & Co.—The quickest steamship passage ever made from Queens-town to New York, was in May, 1873, in 7 days, 18 hours and 55 minutes, by White Star steamer Adriatic. From New York to Queenstown, White Star steamer Baltic on January, 1873, ran the distance in 7 days, 20 hours and 9 minutes. Inman steamer City of Brussels, same trip, in December, 1869, in 7 days, 20 hours and 10 minutes.

L. E. S., Chittenango.—Can I catch trout on my own premises in close seasons? Ans. It is the opinion of eminent legal counsel, who are both trout breeders and anglers, that you or they cannot. You are liable to prosecution under the law. The same is true as to game *ferre nature*, a question that was asked us some time ago, and repeated since. We shall soon print some articles on these subjects from eminent authority.

ALLEGHANY, Pittsburg.—The Derringer pistol was originally made in Philadelphia, by a maker of that name. Its only distinction is, that for a short barrel it carries a very large ball. At first they were always muzzle loaders; now they are made breech loading. Their small size and heavy ball as a means of personal protection brought them much into notice. Mr. Lincoln was killed with a Derringer. Derringers are only of use at close quarters, and are murderous weapons.

J. H. W., Williamsburgh.—Where near this place can I catch shad with fly and line, and how do I get there? And also where can I catch trout on this island, in ponds not owned by breeders, and what route to take? Hoping to receive a prompt reply. Ans. 1. Take Connecticut River R. R. to South Hadley Falls. 2. No ponds with fish in; all netted out. Try ponds near Patchogue, South Side R. R. Go to Austin Roe's hotel and you'll have a good time "if you don't catch no fish."

L. T. A. R. E., Atlanta, Ga.—Downs, naturalist, of Halifax, Nova Scotia, sends us the following receipt for dressing caribou skins, which should be preserved: Glauber salts, 2 lbs.; rock salt, 1 lb.; alum, 2 lbs.; all to be dissolved in boiling water; leave them in about ten days, take them out occasionally for a little while during that time; cut the edge of the skin to see if the tanning has gone through; then take them in the hand and beat them over a round stick or block until they are soft. They are to be beaten with the hair side in, then made up into a pair of moccasins hair side out.

CLARK & SNEIDER, 214 Pratt street, Baltimore.—In the International match there are no rules as to methods of loading. False muzzles perfectly in order. The Metford rifle is loaded in that way. No restriction as to sights, save telescopic, magnifying and front operative sights, such as solid disks or bushes pierced in the centre, which would prevent the danger signal from being seen by the mark-man. Globe sights perfectly in order. We publish to-day a short account of the Rigby rifle. Thank you for suggestion. See changes in targets at Wimbledon in to-day's paper, but they will not affect the coming match, when the old targets will be used.

S., Kansas.—To make bird lime, boil down linseed oil of the best quality until it becomes thick and glutinous. It should be boiled in an earthen pot in the open air, for about two or three hours. It is very essential that an earthen vessel should be used, as an iron one heats and the oil takes fire when boiling, and in such a case is useless as bird lime. A pot should be used with a tight fitting cover, to prevent the fire entering inside it. When prepared set the oil away in tin boxes with tight fitting covers until it is to be used. Prepared lime made of pitch and oil and sold by some dealers, is worthless.

EUPHRONIA, New York.—Be kind enough to give the special characteristic points of the Dandie Dinmont, as distinguished from the skye terrier, or any other fellow? Ans. The Dandie Dinmont terrier owes its name and celebrity to Sir Walter Scott. In size it is intermediate between the Scotch and skye dogs, but we have seen some smaller than the latter. A good Dandie Dinmont is a capital rabbit dog. He is generally "pepper" or "mustard," that is grayish black with some tan on muzzle and legs, or yellow mixed with gray hairs. We have seen those whose hair resembled silvery silken threads mixed with gold. The silky tufts over the eyes and the shocks of hair on each side his face, give him a grotesque but not displeasing appearance. He has short legs, low shoulders, long body, large head, square jaw, a bright and intelligent eye and does not belie his looks as a "knowing customer."

D. T. D., Canandaigua, N. Y.—A party of us are thinking of forming a Poultry Association. What is the law governing an organization, and how many persons are required to incorporate? Ans. A bill just passed by the New York Legislature provides as follows: Any number of persons not less than nine may form a company for the purpose of importing and improving poultry, small birds, domestic animals and fish, and collecting and disseminating useful knowledge concerning them, by holding fairs, distributing awards and premiums, and by publishing debates and transactions, and by such other lawful means as the members of the society may deem expedient. Such societies shall have power to elect a president, one or more vice presidents, secretaries and a treasurer, and may make a constitution and by-laws for their government, and may hold real estate or other property to the value of fifty thousand dollars.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

103 FULTON STREET, NEW YORK,
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, APRIL 9, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

REMOVAL.

The office of FOREST AND STREAM will be removed early in April to the Iron Building, No. 17 Chatham Street, lately occupied by the *Staats Zeitung* newspaper, which we have leased for a period of years. This splendid location in Printing House Square we shall occupy jointly with our popular daily contemporary the *Evening Mail*.

FIELD SPORTSMEN'S CLUBS—A PLAN FOR DOG FIELD TRIALS.

THE dates fixed for the meetings of the various sportsmen's conventions throughout the United States is fast approaching. In order to afford the members of the clubs a new and novel recreation where the skill of the man and instinct of the dog may be brought out to the utmost perfection, and would moreover tend to improve the breeds of their animals, and give useful information as well as amusement, we offer the following suggestions to the shooting clubs of America.

As field trials for pointers and setters are attracting universal attention in almost all the States, and especially in the Western country, it would be well to offer some directions, which may be found of service in facilitating the management of field trials by the sportsmen's clubs. As the date of the annual conventions has, we believe, been arranged for this year, in the months of May and June, a close season for all game birds, therefore it is impracticable for trials this season. The clubs, however, could without difficulty have a primary field trial in the fall, and the date of the annual conventions next year be altered to the autumn.

1st. The club proposing to engage in an informal dog trial, the object being to decide which is the best field dog or dogs in the club, the club should first issue a letter to all its members, stating that any gentlemen owners of pointers or setters wishing to enter their dog or dogs at a field trial, can do so for a small entrance fee, which fee ought be sufficient to cover the expenses of the trial.

2d. Supposing there should be a number of entries, say as many as eight, it would be almost an impossibility to test all these animals at one and the same time, owing to the known scarcity of game birds in the majority of the sections of the country where associations of the kind exist, and besides judges, referee, owner, or worker would of course have to follow the dogs and record their action, &c.

Therefore let the names of the animals be written on a piece of paper and placed in a wheel and drawn therefrom by the secretary of the club by couples, the first two names drawn out to be tried in the field together, and so on until there are four winners left. Then repeat the same with these four dogs' names, and let two be drawn the same as before, or if thought better, by a mutual agreement of owners. The winners of this trial could then be tested at the final issue and the animal which showed the best nose, style, pace, breaking, and working on trailing game, (as he would of necessity have beaten all the other dogs indirectly,) might fairly be considered the representative dog of the club, and the best public performer in the field.

3d. It is presumed that many of the animals entered in individual club trials, would not take more than half an hour or so to test their marks of merit over game, and a rule might be enforced that any dog not making 50 per cent. of the nominal or arbitrary standard, namely 100 points, could be withdrawn or ruled out so as to save time. In this way most of the so-called "remarkable animals" would have a fair opportunity given them of having their excellence thoroughly tested.

4th. Where a member of a club would wish to hunt his brace of dogs against another member's couple, then the mark of merit called "backing" would be brought out. It is conceded that "backing," even when seen by persons indifferent to field sports, is one of the most beautiful and interesting sights, especially tending show in its best light all the finer qualities and instincts of a thoroughbred dog.

5th. When the successful animals of the different clubs have been judged, and the stakes awarded to the winning dog, then the clubs should send, so to speak, dog-delegates to represent their club at the annual Sportsmen's Convention held in the State.

6th. These trials having been all performed successfully, we would then suggest a Grand State Field Trial of all the dogs belonging to the clubs represented. The entrance fee could be enlarged, and the money derived from these fees should first be disbursed for the expenses of the trials, and the remainder would be sufficient to purchase a handsome silver collar, as the winning dog beyond all doubt would be the best public performer in the State. These methods of testing the superiority of breed and endurance would add considerable interest and eclat to the already successful meetings of State Sportsmen's Conventions.

7th. Then to carry the trials still farther we could have State trials, to determine the best and staunchest dog of the different States, and so in like manner arrive at the rather now undetermined conclusion of which is the best pointer and setter in the United States?

8th. We think two judges and a referee would be sufficient to carry out the above forms. The judges should be selected by a ballot of members of the club, those not having any animals on trial, but the referee should always be appointed by the owners of the dogs entered for the trial.

9th. Any dogs that the judges wish or demand to see hunt again, should be called out and tried, and the final issue left solely in the hands of the arbitrators. For laws for the use of judges and referee, see FOREST AND STREAM, page 410. Appended are the

POINTS FOR POINTERS.

Name of Dog.	Nose.	Pace and style of Hunting.	Breaking.	Pointing (style and steadiness in.)	Backing.	Drawing on Game or Roading.	Total.
Forest.	30	20	20	15	10	5	100

POINTS FOR SETTERS.

Name of Dog.	Nose.	Pace and style of Hunting.	Breaking.	Pointing (style and steadiness in.)	Backing.	Retrieving.	Drawing on Game or Roading.	Total.
Stream.	30	15	15	10	10	15	5	100

In conclusion, whenever such contests are inaugurated, field sportsmen would find in a few years that dog trials, such as we have described, if properly managed and conducted by gentlemen, would excite the liveliest spirit of rivalry and emulation among all classes, and would be quite as popular as any of those out-door public exhibitions which now draw such large assemblages of people. Moreover, they would tend in every way to elevate the taste and to make our citizens more familiar with those subjects, which induce a proper zest for manly sports which are without a single demoralizing effect.

SHAD IN OHIO RIVERS.

IN the first report of the new Commissioners of Fisheries for Ohio, namely, that for 1873, a synopsis of which has already been printed in this journal, reference is made to the introduction of shad. The Commissioners think that any experiment having for its object their ultimate domestication and acclimatization in the waters of Ohio, will result in disappointment, in view of the fact that there is no record of shad culture being successful when they are deprived of access to the salt water. They also remark that "although fish are known to traverse great distances, yet it is exceedingly doubtful whether they would traverse the distance from any one of the tributaries of the Ohio down to the Gulf of Mexico, and then in a few months return to these tributaries to spawn."

We regret to see that the question is thus begged, of the availability of shad for the waters of Ohio; as there is every reason to believe that this experiment will succeed, if tried on a proper scale. As fish are in constant motion all the

time, whether in the ocean or the rivers, there is no particular reason why the journey should be very difficult to them; and as it is a well established fact that the shad runs up the Yang-tse-Kiang in China, to a distance of over 3,000 miles, where they are caught and used as food, it would seem that there can be no particular difficulty in their getting to any accessible tributary of the Ohio, from the Gulf; and still less difficulty would there be in passing up from the lakes. Indeed, according to Dr. Goldsmith, one of the Commissioners of Vermont, a few shad have actually been caught near Louisville; and Dr. Turner reports their capture in the Wabash River. The shad, like the salmon, seems to be influenced very little by distance in its travels, the short rivers and the longer within its area of distribution being equally well stocked, provided no obstructions, natural or artificial prevent.

On the western coast salmon are known to go up to the headwaters of the Yukon River, a distance of several thousand miles, and almost as far on the Frazer and the Columbia; and so far as we know, the only limit is some sort of impassable barrier. At the same time they abound in a stream extending only a few miles from the sea.

We shall know in a few years whether shad can sustain themselves in the great lakes; but the fact that the food of the shad, as well as of the salmon in the ocean, consists in a great degree of a species of *mysis*, and other minute crustaceans, and that the deep waters of the great lakes abound in this same *mysis*, renders it extremely probable that the experiment already made will be a success. It is at any rate worth trying, as but little may be lost should it fail; and if successful, a great deal would be gained. It is a question whether, after all, the number of native and resident fishes in the fresh water stream can be increased so as to form an appreciable portion of the food of the State. Of course, with a scanty population, this may readily be brought about; but with a State having the density of population of Ohio, whatever be the success with the blaek bass and other fish, we are greatly inclined to doubt whether they will ever be sold at four cents per pound, or even at twice this sum. The reason of this lies in the fact that a certain amount of food is necessary for each fish, and as long as the food is in excess of the requirement, the number of fish will increase; but after a time a balance will be reached, and the fish will cease to grow as rapidly, or else they will devour each other in greater proportion and thus the increase be prevented.

When we bear in mind the fact that according to certain estimates, it requires twenty pounds of animal food to make one pound of fish, we may realize the difficulties in the way of an indefinite increase in the stock of native or resident animal feeding fish in the interior waters. With the anadromous fish, however, as in the case of the salmon or shad, the case is entirely different. All that the rivers furnish to them is a passage way, a suitable spawning ground and the needed sustenance for the young fish while still very minute, these going back to the ocean after a short interval, (the young shad remaining in the fresh water a few months only, and the salmon about a year,) where they reside for about three years, and in which they find all the food that they require. They then return to the point from which they started, fully grown; and as the old fish are believed never to feed, under any circumstances while in the rivers, there is apparently, no limit to the numbers that can be introduced by judicious action. Such at least is the hypothesis that has much to recommend it, and it will not do to assume that anything in this direction is impracticable when the entire history of fish culture gives us so many reasons to the contrary.

PROTECTIVE LAWS FOR GAME AND FISH.—Our attentive friends in the Legislature of this and other States send us constantly drafts of bills, passed and under discussion, providing for the protection of fish and game in specified localities to be made exceptional to the provisions of the general State law, until they have accumulated to a considerable pile. It is useless to take notice of them or print them, for they only confuse the conscientious angler who is anxious to conform to statutes, and at the same time operate directly to defeat all general and sumptuary statutes, by giving evil-disposed persons a dozen loop-holes of escape from their penalties. Any one can very reasonably plead ignorance of the law, when there is a petty enactment for every separate lake, pond, and stream in the State, and when even the freeholder cannot tell what particular law governs his own private preserve. We trust to see some measure soon adopted that will sweep this local legislation out of sight, and that a wholesome law for each State, and a plan of co-operative laws for all the States, will be framed, adopted, observed, and universally extolled. If special restrictions are required to extend close time or secure total prohibition as to certain waters or districts, the duty should not be imposed upon the legislatures, but be assumed by those persons most immediately interested in the preservation and propagation desired, either through Associations or individuals.

SALMON RIVER LEASES.—We call especial attention to the advertisement this week of Canadian Commissioners Whitcher, designating the names and rates of desirable salmon rivers in the Dominion that are to lease. The information given is of the utmost importance to anglers, and we need not hesitate to say, was furnished at our own suggestion and urgent solicitation. We shall print from week to week such information relative to Canadian rivers, routes, and anglers, as will be most useful to our readers:

TARGET CHANGES AT WIMBLEDON.

SOME time ago we intimated that it was probable that the old forms of targets and marking at range shooting would be changed, and now by the late Wimbledon regulations just received we find that the former methods have been almost entirely revolutionised.

It became quite manifest to the English rifle experts that the old plan, though admirable in its way, no longer gave those distinguishing marks of excellence which allowed finer rifle performances to be accurately distinguished. It may be said that the rifles themselves and the men who used them have gone ahead of the targets and methods of marking. Rifle shooting, which was highly creditable A. D. 1860, in 1874 would scarcely elicit a passing comment. If in the use of the present breech loading system of fowling pieces, it has been remarked that "the guns have surpassed the birds," in range shooting, the rifles have then advanced far beyond the targets. Such changes as have been made, we believe to have been necessary in England. At Wimbledon, when ties were constant, when carefully disputed matches had to be left over sometimes for days, and then fought over again, and then decided by a shot or two, delays and anxieties were innumerable. The new system of targets is scarcely more difficult to hit in some respects, but it certainly permits of greater nicety in marking, and discriminates in favour of the more skillful marksmen. "Ten years ago," says the *Volunteer Gazette*, "Captain MacGregor and Mr. Hemming urged the introduction of paper or canvas targets with concentric rings, and at last the rapid improvement in the shooting, and the insuperable difficulty which arose from the long strings of ties at Wimbledon, have forced upon the council of the National Rifle Association the abandonment almost altogether of the iron target, and the acceptance of the annular system."

To describe the changes, they are as follow:—

AT 200 YARDS. No. 1.

An Annular or Circular Target.

Bull's eye (black), 8 inches diameter.

Centre 16 " "

Inner 28 " "

Outer 40 " "

These measurements from the centre of the target.

AT 500 AND 600 YARDS. No. 2.

An Annular Target.

Bull's eye (black), 22 inches diameter.

Centre 38 " "

Inner 54 " "

Outer 70 " "

These measurements from the centre of the target.

AT 800, 900, AND 1,000 YARDS. No. 3.

Combination of Annular and old Rectangular Form.

Bull's eye (black), 3 feet in diameter.

Centre Concentric ring, 4 feet 6 inches in diameter.

Inner, 6 feet square.

Outer (remainder of target), 6 feet by 12 feet

The marking is now increased by one new factor, the Inner, making four grades of merit. The scoring is as follows:—

Bull's eye counts	4
Centre	3
Inner	2
Outer	1

Though we feel certain that this change was imperative, we regret to think that it may be a source of confusion to us in the United States, as we cannot now be able to compare, save in an approximate way, our shooting at Creedmoor with that at Wimbledon. Granting that our progress in range shooting has been remarkable, it may be some time before the new Wimbledon regulation target may be of service at Creedmoor, our essays in the United States of hardly a year not having made us quite as proficient as they are in England after fourteen years of constant practice. What is certain, however, is that we shall have to adopt the new system ourselves sooner or later. In regard to the match with the Irish Eight, we suppose the target such as was in use prior to the late change will serve for the international match. Targets, like laws, are fortunately not inflexible, and must all yield in time, as arts, skill, or morals improve.

TO OUR INVALID FRIENDS.—As we have been instrumental in sending many of our friends to Georgia and Florida, where the soft and balmy climate may have brought back new vigor to life somewhat impaired by the rigors of our colder temperature, we would here beg them to tarry yet awhile and not come home too early. There can never be such a mistake made as to leave the south too soon. Persons with weak lungs, who have been benefitted by the change, are prone to forget in their longings for home how capricious is the climate north. To-day, April 4th, it snowed in the morning, and the chances are that it will snow again. May is but May in name, and budding flowers and vernal breezes are mere poetry, and not facts. A single boisterous day, with its cold harsh winds, which chill to the very marrow, is fatal to those suffering from pulmonary diseases. If a decided improvement is felt in health by the sojourn south, allow Nature to continue the cure. It is time enough in June, not before, to return home, and the most experienced physicians declare that their patients should never think of putting their foot in the north before the 10th of June. We give this note of warning, as we are informed that cars and steamers are crowded with passengers coming from Savannah and Charleston, and because we are distressed to notice frequent sad terminations to lives which might have been spared or much prolonged if those in delicate health had only remained a month or so longer in the south. It seems

to us madness to forego all hopes of recovery, of life itself, to brave a terribly trying climate on account of a childish impatience which cannot wait until a perfect cure is effected.

THE SHARPE RIFLE MANUFACTURING COMPANY AND THE INTERNATIONAL RIFLE MATCH.—It gives us great pleasure to produce the letter from the Secretary of the Sharpe Rifle Manufacturing Company to the President of the Amateur Rifle Club of this city, in which it may be seen that a handsome contribution has been made towards defraying the expenses of the coming International Rifle Match. We feel very sure that, before long, we shall present other cases of equal liberality.

OFFICE OF SHARPE RIFLE MANUFACTURING CO.,
HARTFORD, CONN., April 2, 1874.

COL. G. W. WINGATE, President Amateur Rifle Club, New York:

DEAR SIR—We notice with pleasure the avidity with which the challenge of the Irish Eight, or Champion Irish Team, was accepted by the Amateur Rifle Club of New York. Although long range rifle shooting in this country is of comparatively recent date, and your opponents have had years of experience, the great improvement made by members of the Amateur Rifle Club, at Creedmoor last summer, satisfies us that the famous Irish team, with their Rigby rifles, will find no mean opponents, and that our historic reputation as riflemen will not be dimmed. I think we can say without egotism that there are no rifles superior, and but few equal to those of American manufacturers, from whom almost all great improvements in fine arms have emanated. It is needless to add that we feel great interest, but no fear of the result, and will cheerfully do what we can towards your success, as an earnest of which we have to request that you will make a sight draft upon this Company at your own convenience, for two hundred and fifty dollars, and accept the amount as a contribution towards the necessary expenses of the match. Very respectfully, yours, &c.

S. H. GREEN, Secretary.

A PROPER REMEMBRANCE.—Last week, in Congress, amid the din of debate between inflationists and contractionists, Mr. Cragin, of New Hampshire, presented a memorial, signed by the survivors of the Polaris Expedition, asking in consideration of the very terrible hardships they had gone through that the modest sum of \$1,000 should be allowed each of them, and in their petition they beg that the Esquimaux Hannah and Joe shall be equally remembered. We feel certain that the Naval Board, to whom the matter is referred, will remunerate all these gallant men. At the same time, Mr. Sherman, in behalf of Mrs. Hall, the widow of the brave Captain Hall, who commanded this Arctic Expedition, prayed that the Naval Committee should allow Mrs. Hall a pension. The Senator spoke well and kindly when he said: "that he knew of no case which appealed more directly to the sympathy of the country, as the sudden death of Captain Hall had left his wife and children in a destitute condition." We believe it would be a crying shame, reflecting on all of us, if Mrs. Hall was left in want, and the pension she asks for should hardly be looked upon as a petition, but rather as a just claim on the nation at large.

—The number of human lives said to have been destroyed by beasts of prey and snakes in India in 1870–71, according to the *London Medical Record*, was 2,225. The reward given for tiger killing during that time amounted to £2,511, but for snakes only £2 14s. was spent. In 1872 the amount paid for snake killing only amounted in the presidency of Madras to 28s. 6d. Then in 1873 a serpenticidal zeal seized on the whole population, and for a million and a quarter of snakes the handsome amount of £15,728 was paid. The reward was given for all kinds of snakes, but repenting of their liberality the government now agrees to pay only for cobras, and offers about 1½d. per cobra. It is affirmed that the natives cannot afford to raise cobras at this low figure.

HYDROPHOBIA SUCCESSFULLY TREATED.—In our next issue we will publish a most interesting letter from Dr. H. C. Yarrow, of Washington, in regard to the cure of hydrophobia, which terrible disease this distinguished physician has treated most successfully. A great deal of interest has been excited lately in the United States in regard to hydrophobia, and information of the character such as Dr. Yarrow so kindly gives us will be fully appreciated.

BRACKETT'S SALMON PICTURES.—An English paper contains the following notice of these remarkable pictures, which were recently sold in London:—

"There is now on exhibition at the Crystal Palace a series of paintings representing the capture of a salmon, the work of a distinguished American artist, Walter M. Brackett, of Boston, U. S., entitled, 'The Rise,' 'The Leap,' 'The Last Struggle,' and 'Landed.' In 'The Rise,' the salmon, under water, is seen arising or darting towards the fly on the surface. The fish evinces great eagerness, as if fearing that a trout or some other meaner fish would catch it. The fly is made of an argus pheasant's wing, brown hackle, and a tail from the top-knot of the golden pheasant. The salmon appears to be a gay one, scarcely out of grilsehood, but of 'fresh run' and active. Its scintillant sheen is painted to the life, and the water and rocks representing the scene of the sport to be just above a rapid, is as well chosen as the treatment is most perfect. 'The Leap' shows the hook fastened at the gristly corner of the mouth—the best place to hook and save your fish. The salmon before you, with the sparkling water dropping from the fins, the action of the fish and position of the hook and tension of the gut-leader are perfectly represented. It is the best salmon leap ever seen on canvas. In 'The Struggle,' Mr. Brackett has evinced the art of a master thoroughly acquainted with the subject, which he is as good an angler as a painter, if possible. The salmon is here represented in the act of his last delirious struggle and almost exhausted. The fish has evidently attempted to run the chute or rapid just below it, and has been checked by the angler; hence the last struggle for freedom. But the steady tension of the line, and that unforgiving fly have been too much for the gentle salmon; and notwithstanding his glitter and dress of burnished silver, he is forced to submit to be hooked by a cruel gaffer, who lives by such cruelty. In 'Landed,' the noble salmon

lies gracefully upon the sward, with the awful gaff-hook and split bamboo rod beside him, a dead monarch clothed in a glittering coat of burnished steel."

Sporting News from Abroad.

WE notice in the *Land and Water* a word of admonition given apparently to London game dealers. Our contemporary states "that to judge by the look of their shops during the last week, game dealers hardly seem aware of the risk they run in exposing for sale the various kinds of fowl named in the 'Wild Birds Preservation Act.'" The law seems to be peculiar in England in regard to selling birds out of season, there being no fine for the first offence, but the parties in default having to pay "costs," which is pretty much about the same thing. Positive proof has to be furnished, says our authority, "by the possessor of the prohibited fowl, that it has been imported into the United Kingdom from foreign parts." As it is at present "close time" in France, Belgium and Holland, it seems then highly probable that English dealers are selling in opposition to the law. Though in the United States we are, unfortunately, quite far as yet from obeying the law of "close season" as thoroughly as we should desire, still it may be a satisfaction to our own New York Association for the Protection of Game to know that the law in regard to the disposing of birds at illegal periods is, perhaps, more carefully kept here than in London. We feel very certain that we express the opinion of the association when we state that their success in carrying out of the measures proposed by them is due, in a great measure, to the earnest help they have received from the game dealers themselves. Say what we may, we are certainly a law-abiding people—perhaps more so than our neighbors give us credit for. Infractions of our game laws may be in part due to ignorance, but they occur more frequently from the wretched character of our legislation. What is wanted in the United States is laws protecting game, which shall be the same for wide areas of territory; that animals, birds and fish, being in similar geographical zones, shall have "closed seasons" of exactly the same duration. Then Maine cannot send birds or fish to Boston, or New York, or Philadelphia out of season. The laws of the different States, now vague, even sometimes impossible to discover, hidden, as they are, in a vast mass of verbiage, require simplification, and the solution offered by the FOREST AND STREAM, from a great deal of study devoted to the subject, we believe to be not only feasible, but easy to carry out. As to foreign game coming here, it can never arrive in large quantity, save from the British provinces, and to frame laws governing it would present no difficulty.

—Baron Rothschild's sale of racing horses, disposed of after their master's demise, was a leading event last month in England. The sale was attended by many of the foreign commissioners, though the only purchase was made by Count Lelindorff, Master of the Horse to the Emperor of Germany. The great Tattersall disposed of them, who opened the sale with an eulogium of the departed Baron. The twenty horses sold realised 14,305 guineas, showing the enormous average of 715½ guineas each. The *London Times* says: "Take the horses all together, they were probably the best looking and soundest stud of horses ever offered for sale, and looked in good health and condition, reflecting great credit on their trainer, Hayhoe, who had lived with the late Baron Rothschild for upwards of twenty years." Marsworth fetched the highest price, 5,000 guineas, and goes to Germany, where, with the famous Blue Gown, he will help to improve the race of Prussian horses.

—From the bulletin of the *Société d'Acclimatation*, we have some very accurate data in regard to the use of horse flesh in France. "In 1847," says M. Decroix, the founder of the French horse eaters, "M. I. Geoffroy Saint-Hilaire, first commenced his labors, but it was only five years after his death that the first horse shop was opened in Paris, in 1866. It has been developing ever since. In 1867, 2,152 horses were consumed, but last year 8,971 animals were eaten, this latter number being made up with 1,092 asses and 51 mules. (The absence of mules in quantity is notable, though satisfactory as proving that mules do die sometimes.) On the 1st of January of this year, Paris rejoiced in 48 horse butchers, and outside of Paris there were five more shops. One curious question which naturally suggests itself, is, where do the horses come from? M. Decroix enumerates them. The old horses, the lame ones, those who have injured themselves, those killed by accident, and the blind, furnish the stock. Of course the condition of the horse is examined by a veterinary surgeon before he goes to the butcher. Do French people like horses? It seems as if they did, for a M. Giraud, a sausage maker of repute, worked up into links last year no less than 500 horses; of course price is an object, horse flesh being sold at from 70 to 80 centimes the pound, about 14 to 16 cents, (which is dear enough, we think,) but then beef from cattle is worth twice as much. When this horse eating movement was commenced, an animal good to kill was worth 30 to 50 francs, to-day he is in demand at from 130 to 150 francs. Repulsive as the idea of masticating horse flesh may be to the dainty ones, four millions of kilograms of meat, worth four millions of francs saved to France, is worth thinking about. The author of this remarkable paper on the horse, "as a source of food," describes a dinner given by him to certain English and American guests, among them Dr. Bowditch, of Boston. The menu was as follows:—Horse soup, boiled horse, horse sausage, horse *a la mode*, horse tongue, potatoes fried in horse grease, roast horse, a salad dressed with horse oil,

and to wind up, apple fritters browned (to vary the *carte*) in chevaline fat. It does seem to us a little like *toujours perdrix*. We confess to have eaten horse, we admit it, but then it was dressed by a cook called Hunger, and starvation was the sauce, and very fair was it under the circumstances. To us it was savory, and the grain of the meat was short and crisp. Just now, perhaps, more pampered, though we should have been glad to have accepted M. Deeroix's invitation, we would have preferred for a change a fowl, say, stuffed with truffles. One curious fact noticed is that white horses are hard to dispose of, even to those having no affectation about eating horse flesh, because of the peculiar color of the meat. Paris, where tastes are cloyed, where the impossible is asked for and found, (as we are treating of gastronomic subjects) is now indulging in omelettes *a la Casaor*, the Emus of the *Jardin d'Acclimation* having furnished the eggs. What jolly Easter eggs the ostriches would have made. To conclude, however, this horse eating question, we beg to state that, even should Delmonico or Mouquin introduce horse flesh—say a *Macedoine de Mustang*—on their bills of fare, we should be glad to know of it, as we could promise them, even in New York, quite a number of hippophagists as their guests. Some day butchers' meat, outrageously dear, may drive us all to eating horse.

—Fox hunting in England is now in full blast. We notice in the *Sportsman's Gazette* that on the occasion of a run with Sir Watkin Wynn's hounds, the fox made for a cottage in Wrexham town, and had to be ejected with a pair of tongs, the kill taking place in the street, much to the amusement of the townspeople. We see, too, that Lord Napier, of Magdala, came near going to grief at Secunderabad, in India, having fallen with his horse into a mullah. The hero of Abyssinia was badly shaken, and it will be some time before he will be able to ride again.

—On the 28th and 29th of this month, near Shrewsbury, the Field Trials of Pointers and Setters will take place. The president will be Viscount Downe, and the judges Viscount Combermere and Sir Vincent Corbet.

Sea and River Fishing.

FISH IN SEASON IN APRIL.

Salmon, *Salmo Salar*. Trout, *Salmo fontinalis*. Land-locked Salmon, *Salmo gloyeri*. Salmon trout, *Salmo confinis*. Shad, *Alosa*.

In our last issue we designated what constitute the essential qualities of a perfect fly-rod, giving also a few general hints as to the selection of trout flies. Possibly in future numbers of this journal we may attempt some definite instruction as to the mode of tying flies, indicating the patterns and sizes suitable for the various species of fish on the angler's list, and the proper times and seasons for their use; though this is a subject which we are loth to undertake, for we not only expose ourselves to constant criticism, but the field to be covered would fill a volume—the specimens of trout flies alone reaching some 800 in number! The reader will at once see what a stupendous task he imposes upon us when he calls for *full* written instruction in the science of angling. And just here we may say that while verbal instruction is useful to a certain extent, the art cannot be wholly imparted, but must be acquired by assiduous practice, and a careful study not only of the implements of the craft and their use, but of the structure and habits of the fish and the localities which they inhabit. In a word, the complete angler must be a naturalist, just as a physician must be acquainted with the origin, nature, and properties of the drugs he administers.

As to implements, we maintain that there are strictly but two distinct classes of fishing rods—the long, slender, tapering, tough, and elastic fly rod, and the shorter and stiffer trolling rod—just as there are but two classes of guns, the rifled and the smooth bore. Difference in the material used constitutes variety, and in the selection and manufacture of this material, excellence consists. A rod of hickory, ash, lancewood, green heart, iron wood, cane, or mahoe wood may be intrinsically better than one of split bamboo, but the *best made* split bamboo is the superior of the best made rods of the other material, in our private opinion, for the reasons that it combines the qualities of all the rest, and is *lighter*. This quality of lightness is a most appreciable desideratum, especially in a salmon rod, and a not trifling advantage to the angler who has a whole day's work before him. As every veteran knows, each additional ounce tells painfully in the long run on arms, back, and shoulders. Practically, there is no better rod than the West India cane in its crude native state; but as this is inconvenient to carry, on account of its great length, ingenuity has contrived a jointed rod which occupies a comparatively small space. Besides, in any given entire cane there are liable to be flaws, which impair its strength and effectiveness; but by using its choicest parts, which are sawed out and fitted together and firmly whipped with silk, the manufacturer is enabled to produce an implement as perfect as it is possible to make. In trout rods this quality of lightness is not so essential, and it is not unusual to find professional experts who prefer a rod made of some other material than bamboo. We sometimes use a short stiff rod for bait fishing in streams overgrown with alders when we want a mess of fish for the pan.

As we have said, rods are made in joints or sections simply for convenience; but as the metal ferrules, being stiff and unyielding, impair the uniform elasticity and play of the rod, there is a growing tendency in salmon fishers to have as few joints and as few ferrules as possible. Hence,

we find some eighteen feet rods made of only two pieces and united by a splice, the parts that join being bevelled and firmly lashed together when in use by a waxed end, the ferrule being dispensed with altogether. Other rods of three joints have the first and middle one connected by a ferrule, and the middle and tip by a splice. Some makers use a screw ferrule, a device which renders loop ties unnecessary, and prevents the rods from becoming shaky at the joints by wear. We prefer a salmon rod of not more than eighteen feet in length, though rods of twenty-one feet are used; but they are ponderous affairs. An expert can make a sufficiently long cast and do all necessary execution with the former, while the only advantage of extra length is, when a fish is *hors du combat* to lift the line more easily over rocks and boulders that may interfere with a clean run.

Trolling rods are usually made of undressed bamboo, and are about nine feet in length. They are stiff, but have elasticity enough to enable the angler to feel his fish readily when it bites, and to hook him with much more certainty than with a hand line. In securing a fish after it has been hooked, the trolling rod is all important, for it permits a delicate manipulation and handling of the fish; whereas, if a hand line were used the hook would very often tear out and let the fish escape.

The selection of a rod requires a certain keen, acquired sense of sight and touch, which adepts only possess—sight to detect any variation from a perfect arch, and a touch that instinctively determines the nice balance of the rod, and any sag or unequal distribution of elasticity throughout its entire length when it is swayed backward and forward by the hand and wrist. We would advise all novices to let a professional select their rods for them. Discard all rods with patent attachments of spikes, and the like, to "hold" the rod. If you want a rod holder buy the contrivance referred to in a recent number of this journal. Also reject any rods that have the but squared off where the hand grasps it, where the rod proper joins the handle, so to speak. The object of the maker of this kind of rod is to secure lightness, but he does it at the expense of strength and every other requisite. A proper rod should have a suitable bulge of the but to fit the hand, and from it taper gradually and uniformly to the tip.

We think little more can be said by way of instruction as to what a perfect rod should be, except that the rings should not be too large, and yet large enough to permit the line to render freely through them. In our next we shall speak of lines and reels, and instruct the novice how to prepare a cast of flies. The fourth paper will give instructions for fly fishing.

—A letter from Lynchburg, Virginia, says that trout fishing is in order, and the streams have been in good condition for three or four weeks.

—Bass fishing has commenced in the Schuylkill and Delaware rivers—in the former above the falls of the Schuylkill, and in the latter from a few miles below Trenton northward. The success, as far as reported, has been moderate, a result, we are inclined to think, due rather to the inexperience of the fishermen than to any scarcity of fish. The shad catch in the Delaware up to the beginning of the present week has been small, but is daily improving, and with the advent of warm weather the fishermen hope for better luck than last season. The fish thus far taken have been of good size and in good condition. In the former particular there have been some splendid fellows in the market, and they of course commanded high prices.

—From Lovelton, Wyoming Co., Pa., we have received the following information which may be interesting to those of our readers who may be desirous of making hunting and fishing explorations in this almost virgin section of country this coming season: Trout in Potter, McKean, Cameron and Clinton Counties are still found in fair quantity in the small tributaries of the large streams, such as Pine, Kettle and Driftwood Creeks, which are near the head waters of the Connemaugoning River. Emporium would be a good point to start from, and the route would be by the Philadelphia and Erie Railroad. Possibly the best fishing would be somewhere on the head waters of the west fork of Pine Creek. Here there is a settlement enjoying the delicate name of Youngwomanstown, which might be the place to start from. Elk County, if not abounding with fish, has plenty of deer and bear. In Sullivan and Wyoming, and a part of Luzerne, trout are not very abundant, though good sport is possible when the streams are in good order. The haunts of the streams in this part of the State are hard to get through, and the waters seem to run to all the points of the compass. Fishing is in a perfect wilderness. The best time for fishermen to try this section would be early in May, and Dushore, in Luzerne County, would be the place to make the centre of such expeditions. Our informant is not however very certain in regard to big catches of trout, but states that pigeons abound. Should any of the FOREST AND STREAM readers like to work up this most interesting country, quite as much of a wilderness as the Adirondacks, we can recommend them to Mr. F. A. Maxfield, a thorough guide and hunter. He may be addressed at Lovelton, Wyoming Co., Pa. Guides, \$1.50 to \$3 per day.

—The sealing season of the Newfoundlanders begins in the middle of March and continues until the 1st of May. Some idea of the value of the fishery may be gathered from the fact that in the spring of 1872 the steamship Commodore brought in seals to the number of 32,000, valued at about £24,000 sterling, one third of which, £8,000, was divided among the sealers, say 200, giving to each man £40, a sum realized in six weeks.

MASSACHUSETTS ANGLERS' ASSOCIATION.—The incorporators named under the act passed by the present Legislature and approved by the Governor, met at the Parker House, Boston, Monday evening, 30th ult., and organized under the same. A constitution and code of by-laws was adopted, and a resolution was passed electing all the members of the old association, members of the new, upon their signing the roll of membership.

The following gentlemen are the incorporators:—John P. Ordway, C. Warren Gordon, Charles Stanwood, Elnathan Delano, James Walker, A. F. Squier, James P. Richardson, Walter M. Brackett. Baylies Sanford, John F. Mills, their associates and successors.

The objects of the association, as defined in the act, are to secure and enforce proper restrictions upon the taking and killing of fish, shell-fish and bivalves; to promote fish-culture; to introduce new species and varieties of fish, and to disseminate information relating thereto. The said corporation shall have power to make by-laws, not inconsistent with the laws of the commonwealth, for the regulation of the association and the management of the same and of its concerns; to receive donations, bequests and devises for promoting the objects of said association; to lay and collect assessments upon the members, not exceeding five dollars per annum; to enforce the payment of such assessments by action for the same; to purchase and hold real estate to the amount of fifty thousand dollars, and personal estate to the amount of twenty-five thousand dollars; to elect officers, &c.

At the annual meeting of the Massachusetts Anglers' Association, held in Boston April 3d, the following gentlemen were elected officers for the ensuing year:—President, John P. Ordway; Vice Presidents, Hon. Thomas Talbot, John F. Mills, S. W. Hatheway, Charles Levi Woodbury, C. Warren Gordon; Treasurer, Charles Stanwood; Recording Secretary, Charles W. Gordon, Jr.; Corresponding Secretary, Hon. Baylies Sanford; Librarian, William F. Story; Executive Committee, S. M. Johnson, Walter M. Brackett, James Walker, George W. Clarke, James P. Richardson; Committee on Membership, D. T. Curtis, E. Delano, H. M. Forristall. Messrs H. T. Rockwell, Baylies Sanford, and T. M. Johnson were appointed a committee to consider and report on the expediency of taking measures to secure the passage, by the municipal authorities of Boston and other cities and towns of Massachusetts, of such ordinances as shall carry into effect existing laws for the protection of fish, especially with a view of preventing the sale of fish during the period when it is unlawful to take them from the water. Measures were also taken to enforce the existing smelt laws, which were reported as being violated in Quincy, Weymouth, and Milton. The association will be pleased to receive for their library any reports or works appertaining to fish and angling, which they will promptly acknowledge.

—The Game and Inland Fishery Protection Society of Halifax, Nova Scotia is now fully organized, and comprises some thirty members. At its meeting the last week in March, Mr. C. J. Stewart, President, took the chair. The following were elected by ballot a council of twelve:—Messrs. E. C. Stayner, Robert Morrow, M. Daly, Captain Todd, 87th Regiment; Dr. Jennings, Benjamin Smith, Kentville; E. J. Tobin, F. D. Corbett, C. B. Bullock, F. H. D. Veith, Lewis P. Fairbanks, J. W. Jackson, New Glasgow.

The following resolution, moved by E. J. Tobin, at last meeting, was read:—

Resolved, That in the opinion of this meeting it is highly desirable that the prayer of the petition now in circulation, praying for the total prohibition of moose killing for three years, be granted.

Carried by a vote of twelve to six.

The following resolutions were moved by Mr. E. G. Stayner, and seconded by Dr. Jennings, and passed:—

Resolved, That it is the opinion of this Society that the matter of the Inland Fisheries of this Province has not received from the Dominion Government that consideration that so important a branch of the resources of this country demands, inasmuch that many of our streams and rivers are illicitly netted and speared, numbers of our mill dams are not provided with fish-ways, and many others with quite inefficient contrivances for the free passage of fish.

And it is further resolved, That this Society deem it necessary that the protective system should be largely improved, and that it is of vital importance to the welfare of our Inland Fisheries that a General Superintendent for this Province, separate and distinct from any Province, be immediately appointed, and that it is essential that he should reside in Halifax.

FLY FISHING FOR SHAD.

EDITOR FOREST AND STREAM:—

My knowledge of taking shad with the fly is confined to the results of a single day's experience, but as all anglers owe to their brethren every possible aid, I cheerfully accede to your request, and tell you what I did. From this others may get some hints, and I trust that the present season will enable us to know more about a sport which I am confident is to rank very high hereafter in America.

Trumbull (the artist) and myself went to Holyoke, on the Connecticut, last summer, on the morning of the 1st of July. This was very late for shad; the run was nearly over. It was a dark, showery day. We had gone there to learn something about the reports that shad had been taken with the fly. On enquiry we were assured that they were so taken, but only in the early morning and evening. The fly which was shown us by several gentlemen as the killing fly was a dark woodcock wing, body of the same color, and size larger than the largest sized trout fly; in fact, a small salmon fly. Another authority, however, told us that a large white moth was the best fly, and yet another showed us a large nondescript, with a glaring, golden pheasant wing. It is worth while to note these various statements, because they appeared to come from anglers who had used the various flies successfully in the morning and evening fishing. We had only midday experience.

The Connecticut River, after falling over the great dam, rushes down rocky rapids for nearly a half mile, passes under a high bridge in several channels of various depths, and subsides into a broad bay of still water on the east.

side. We began casting from a boat in the various channels below the bridge, at and near the foot of the rapids. I used all the recommended flies with patience and perseverance, and then went through a well stocked book. There are few large flies which have ever been tied that I did not try in the course of the day. It was all in vain, and no shad rose. It was about two o'clock P. M. when I changed to almost the other extreme of size. I did not use gnats, but these were only a little larger than gnats. I am not given to calling fly hooks by numbers, because the numbers vary so much. These would perhaps be called by some anglers No. 10 hooks. They were the smallest flies in my book. The first bobber was light lemon color body and wings, the second green drake, the tail fly a dark blue body with dun wings. We had observed many dead flies drifting down the river whose color was tolerably well imitated by the green drake. As this cast went out on the rapid, and swung across the foot of the swift water, a heavy fish struck the first bobber, the lemon color. He took the fly gently, barely nipping it, with his head up stream, and went off with a swift and easy swing. Up to this moment I had been skeptical on the shad question. I had taken herring on the fly, but I had doubts about this variety. My doubts were removed. A moment later the fish made a swift rush across the current, and then went into the air two feet high, shining with an iridescence that is scarcely to be equalled by any other fish. The struggle that followed was one of the most exciting imaginable. The shad behaved like a civilized and polished black bass. His rushes were strong and swift, and always graceful. He went into the air several times, always with a beautiful leap. The swirl of the silvery fellow on the tight line was like a flash of white light along under the water. He fought hard and long, and again and again, when I thought him within reach of the landing net, and tolerably well used up, he went off with all the freshness of youth, health, and strength. It was more than fifteen minutes before I landed him. I have said *him*, but it proved a female, full of roes. If you do not know the splendor of color in a fresh caught shad, let me tell you that the gorgeous tints are beyond description. I worked now for some time without another rise, when, as the heavy drops of a shower began to fall, a large and fine fish struck the tail fly, blue and dun. He was heavier than the first. He had hardly touched me when Trumbull struck one on a light brown color, the same fly which my first had taken. It was lively sport as our two fish went out of water, first one then the other, and their swift but graceful movements kept us busy in avoiding a foul. It was certainly fifteen, and perhaps twenty or thirty minutes (who can measure time at such a moment) before I conquered this fellow, and cast again, letting the line go down the current, and simply drawing it across and back, with some fifty feet out. Did I say that my leader was the very finest gut that can be procured? I waited some time, and again, as a shower began to fall, I felt a touch, followed quickly by another; one shad had taken the lemon, another the green drake. This was a situation which of course defies all skill. The heavier fish dragged the lighter one hither and thither until he became angry at his load, threw himself into the air with a swift leap, snapped off the slender gut, and left me to land the smaller fish, which I did after a struggle similar to those I have described. It is useless for me to go on telling the successive fish which we took. The flies took equally well, though of such various color.

Comment on the account seems to be unnecessary. All anglers know how small a dependence is to be placed on one day's experience in fly fishing. There may not be for years another day like that, when the fish are in the same humor, and when the same flies will take. Midday experience is of little value for morning and evening guidance. This is certain, however, that the shad requires very delicate handling after he is hooked. His mouth is very thin, delicate, and translucent, and the hook takes but a slight hold in most cases. No fish that I felt struck hard. Each one seemed only to open his mouth and take the fly daintily with his lips, just as I have often felt grayling in Switzerland and in England. I recommend a light rod. I used a nine ounce rod, and lost several large fish. This season I propose to use a seven ounce Norris. It is possible that in the evening and morning fishing the shad may take larger flies, and the larger hook may have a firmer hold. In that case a heavier rod may be safe. I found after long work that casting in the ordinary way was useless. Only once did a shad take the fly on the surface. An odd sight gave me a hint. As the afternoon advanced a number of men came out on the high bridge and began fishing with long hand lines, trailing a hundred feet of line down the river. Imagine our astonishment, when these lines swung near our boat, at observing that these anglers were fly fishermen! Think of fly fishing with a hand line twenty fathoms long. But I took the hint, and thereafter let my line trail down stream, and moved it across the current and back. The flies were of course just under water, and the fish took them very much as they might take the dead flies of which I have spoken. But once hooked, the fish seemed to wake up, and I have never found more game in anything with fins.

It yet remains to learn when and where the shad will rise to the fly. There is no reason why Holyoke should be the only place in the country. The waters of the Potomac, Susquehanna, Delaware, and Hudson ought to furnish equally good sport. If those who have the opportunity will try the waters especially near the foot of a fall, where the upward run of the fish is interrupted, we shall perhaps soon have knowledge of abundant places for this sport. There is ample room at Holyoke for a hundred rods along the rapids, and the shad, in the height of the run, are innumerable. I trust that some one will let us know whether they will take the fly in salt water. I have taken other varieties of the herring with the fly in salt water in a swift tide-way.

I venture to suggest, as the subject is so wholly new, that anglers on different waters examine with care whether any particular fly abounds on the water, and especially whether it is found dead in the water; and that an imitation of such fly, if it be found, be thoroughly tried. On the Connecticut, in day fishing, I should again use small flies, with yellow or lemon color predominant; but this is only experimental advice.

I have written this account with much hesitation, for I am well aware that the next few weeks' experience will show that my information, based on one short day's work, is of small value. But let us hope that it will induce better anglers to try the shad this spring, and give us such results as will be of permanent use.

I am very respectfully yours, W. C. PRIME.

CENTREVILLE, Wayne County, Ind., March 18, 1874.

EDITOR FOREST AND STREAM:—

I know nothing practically of fly fishing. Hundreds of the readers of FOREST AND STREAM know as little as I do, and we are anxious to learn. We appeal to you, as the head of the profession, to teach us. Of course we have no trout or salmon, but our streams are full of black bass, some being caught that weighed seven pounds. Near my house is a creek with a gravelly bottom and fed by springs. There are many deep holes, and under logs and stumps and rocks in the banks, where enormous bass make their homes. Please give us instructions in FOREST AND STREAM how to catch them with a fly, what kind of flies to use, how to cast, the kind of and time of day, the season, how soon to commence, and many other things which you know that we want to know. By giving us such instructions you will greatly oblige us. A word in regard to FOREST AND STREAM. I have attentively read every number since the first, and have learned more of natural history than from all the best books I have ever read. While in geography it serves as a journal of geography. Long may it live and prosper.

Just now is a dull time in sportsmen's news, but in due time I will write up all that goes on where I travel. Truly yours, A. M. S.

ST. JOHNS, N. B., March 30, 1874.

EDITOR FOREST AND STREAM:—

No doubt but there will be many inquiries through your columns respecting the fishing on the southwest Mismichi River this season, and to save trouble and delay, I thought it would be best to inform your readers that, in future, J. H. Phair, Esq., Fredericton, will have the sole management of the salmon fishing on that river. Any inquiries addressed to him will be promptly answered. I am, yours truly,

C. A. ROBERTSON.

Shot Gun and Rifle.

GAME IN SEASON FOR APRIL.

Wild fowl, snipe and geese to April 15th. The remainder of the month is a close season.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

—Mr. Scott Rodman and Stephen Courter killed on day last week on the big piece, Pine Brook, N. J., 32 English snipe, and are averaging 12 birds to the gun per day. Mr. Rodman remarks "that the weather keeps very cool, and the birds are more plentiful than any previous year for a long time. The gentlemen who come down here are so full of business that they cannot stay over twenty-four hours, generally out of breath, and enquire repeatedly when the train starts."

—Mr. Henry Ohland and John Brown, of Philadelphia, have just returned from the Cohansey Creek meadows, Cumberland County, New Jersey, with 70 English snipe. This is the best bag that has come into the Quaker City thus far this spring.

—Advices from Virginia say that Messrs. Laurence & Lynch are having rare sport, averaging 16 brace of English snipe a day to the gun. "Details as soon as I arrive in the city."

—Some few birds have been killed on the Hackensack meadows. The birds will most likely leave this latitude about next week, but it depends almost wholly on the weather.

—General W. E. Strong of Chicago, who is on a visit to this city, called in at Conlin's gallery last week and made the following extraordinary score with a Ballard rifle. At seventy-five feet he made thirty-one consecutive bells, then missed, and continuing to shoot he again made forty-three consecutive bells, making seventy-four bells out of seventy-five shots at the "word." Size of the target bull's eye two inches in diameter. After this successful practice, he fired twenty shots each at three of Conlin's ready measurement targets, at the "word." The first measured fourteen and seven eighths of an inch, the second 14 13-16 inch, and the third 15 1/2 inches, at the "word." Size of paper target bull's eye one inch.

—The magnificent Gatling gun won by the Seventy Ninth Regiment at Creedmoor on October last, was on exhibition at the Astor House on Saturday last. It is a splendid piece of ordnance, and was gallantly won by the Seventy Ninth, a team of twelve, at 500 yards, in seven shots, having made 199.

—Captain A. H. Bogardus of Elkhart, Ill., and Ira A. Paine of this city will shoot a match at pigeons for \$500 a side and the championship of America. The match is to take place on the 18th inst., at Woodside Park, Stamford, Conn., and both are to shoot at fifty single pigeons, H and T traps, Rhode Island rules.

—Next Saturday Ira A. Paine and Edward Tinker, of Providence, R. I., are to shoot at twenty-five double pigeons for \$500 a side at Providence, R. I.

—James Ward, the one-armed champion of Canada, who was defeated by Paine last Saturday, at Stamford, Conn., has challenged Paine to shoot another match, same conditions, to take place in Buffalo. He claims the referee did not make Paine shoot by the rules in their last contest. Paine has accepted the challenge, and agrees to allow the Canadian champion expenses to shoot the match at Stamford, Conn.

—A caribou was seen in Marshfield, Maine, last week, one of very few seen in forty years.

—The season for wild goose shooting will close on Long Island about the 20th April. Wild geese that have been first winged and then tamed are used for stools nowadays in place of the old fashioned wooden stools, and are deemed very valuable. They are lined to stakes placed out of sight near the bars where the wild geese usually stop to feed, while the gunner conceals himself in a box sunk

in the sand, and partially covered by sea-weed or meadow-grass. When flocks of wild geese are passing, these partially tame ones will call them, and usually they will fly near by or light, when the gunner rises and shoots. Experts have killed as many as twenty-five at a shot.

—We have heard of several large bags of wild geese being made, an immense flock passed over Atlantic City, and alighted at Long Beach near Barnegat last Monday. This is a favorite resting and feeding ground for the birds on their flight north. Wild fowl are plentiful and in great numbers all along the Great South Bay, Moriches and East Hampton.

—Wild geese are now passing over Maine, going north to breed. By the way, have any of our readers been in Labrador during the breeding season and watched the old mother ducks launch their newly hatched broods upon *aqua pura*? It is a sight worth seeing, and ludicrous in its aspects. Years ago, during a summer cruise in high latitudes, we used to see the nests of the gulls, eiders, shel-drakes, *et id omne genus*, upon high clefts in the rocks, and wondered how the parent birds managed to convey their helpless young to water almost the instant they left the egg, and before they could even toddle, or waddle. So, one day we lay perdu, and when all was still and the coast apparently clear, we saw old Mrs. Eider lie flat on her stomach close to the edge of the nest, and receive the fledglings on her expanded and outstretched wings; then with the whole flock aboard, she carefully scuttled over the rocks to the water, and slid into the liquid element like a ship from the ways, and when she was well out into deep water, she settled down and dove out of sight, leaving the young ones floating like dead leaves on the surface, and not at all alarmed at this sudden induction into their natural aquatic element.

—Reminiscences of great hunting days in time long gone past are always of interest. What took place among the Mallard geese, only as far back as 1858, may seem as if almost occurrences of a century ago. From a most thorough sportsman and kind correspondent, Middlesex, we take the facts of a four week's hunt, some sixteen years ago, in the neighborhood of Chillicothe. The sport was varied between shooting on a rice flat, and a goose pond, and occasional visits to snipe ground. In four weeks Middlesex, and his companions, taking it easy, shot eleven hundred ducks, one hundred and four snipe, six geese, fifty-two prairie chickens, and twelve squirrels. Every week says our correspondent, "we sent a box home full of birds to our friends, and railroad directors, superintendents and conductors were all recipients of game."

✕—A wild boar has been ravaging the neighborhood of Union, Kentucky, until his depredations became so great that the citizens turned out in a body to rid the vicinity of the dangerous pest. On the 14th instant, says the *Covington Advertiser*, one hundred and fifty persons, with dogs, guns, etc., met in the public square of Union, and proceeded to the farm of J. D. Smith, on Gunpowder, which the vicious animal had visited the night previous. Here "Modoc," a noted dog belonging to Lucian Dickerson, found the trail, the entire pack was soon in full cry, and was not long in rousing the monster.

After a run of more than an hour through the dense tickets and among the bluffs, the boar broke cover towards the open country, with the dogs in hot pursuit. Here the hunt grew very exciting, the pursuers being frequently in full view of the chase, and using their guns whenever they could, and the dogs (fox-hounds) pressing the game closely, but as yet unable to bring him to bay. In fact it was almost certain death for one to approach him, his formidable tusks proving such fearful and deadly weapons of defense that he had, up to this time killed eight outright and wounded four.

Finally a powerful bull dog was let loose and immediately attacked the furious beast. Then ensued a fierce and desperate struggle. The boar fought as if he knew that his life was in the balance, and the dog was equally game. The latter seized the maddened animal by the right fore-shoulder, and in despite of stabs and gashes from the sharp tusks held on with the tenacity for which the breed is noted. The hunters coming up joined in the battle with pistols, clubs and stones, and under the attack of the combined forces the boar was at length stretched on the ground, conquered only in death. On examination it was found that during the chase he had received fourteen shots, all inflicting severe wounds. He weighed about five hundred pounds, and his tusks were eight inches in length by actual measurement.

The chase lasted about four hours, and a notable feature of the closing scene was the fact that though the dog was nearly torn to pieces and his antagonist was covered with wounds, neither uttered a cry during the fierce death struggle, but both were grim, silent, relentless, and game to the very last, and not until the boar was dead could the dog be induced to release his hold.

—The following is the text of act passed Feb. 7, 1874, by the Missouri Legislature for the protection of game in that State. There is no provision as respects close seasons for fish:—

An act for the preservation of game, animals and birds. *Be it enacted by the General Assembly of the State of Missouri, as follows:—*

SEC. 1. It shall be unlawful in any place in this State to catch, kill or injure, or pursue with such intent, any wild buck, deer, doe, or fawn, between the 15th day of January and the 1st day of September; and it shall also be unlawful to catch, kill or injure, or pursue with such intent, any wild turkey between the 1st day of April and the 1st day of September; and it shall also be unlawful to catch, kill, or injure, or pursue with such intent, any pinnated grouse, commonly called prairie chicken, between the 1st day of February and the 15th day of August; and it shall also be unlawful to catch, kill or injure, or pursue with such intent, any ruffed grouse, commonly called pheasant

or partridge, or any quail, sometimes called Virginia partridge, between the first day of February and the first day of October; and it shall also be unlawful to catch, kill, or injure, or pursue with such intent, any woodcock between the 10th of January and the 1st day of July; and it shall also be unlawful to catch, kill or injure, or pursue with such intent, any turtle dove, sometimes called mourning dove, or meadow starling, commonly known as meadow lark, between the 1st day of February and the 1st day of August. It shall be unlawful at any and all seasons of the year to catch or kill, or attempt to take, catch or kill, by means of partridge nets or other nets, or by traps, pens, pits or other devices of the kind, any pinnated grouse, commonly called prairie chicken, or any quail, sometimes called Virginia partridge, except upon his own premises, or with the consent of the owner of such premises.

SEC. 2. The foregoing section shall not apply to any person who shall kill any bird for the purpose of studying its habits or history; or having the same stuffed or set up as a specimen, or to any person who shall kill on his own premises any birds in the act of destroying fruits or grapes. No person shall destroy, disturb, or rob the nests of any wild bird whatever, excepting those of the crows, blackbirds, blue jays, hawks, owls, eagles, and other birds of prey.

SEC. 3. It shall be unlawful for any person to purchase, have in possession or expose for sale any of the birds or game mentioned in the preceding section one of this act, during the season when the catching, killing or injuring the same is hereby prohibited.

SEC. 4. It shall be unlawful for any railroad company, express company, steamboat company or other company or corporation, or private individual, to have in possession, or receive for transportation or carriage, or for any other purpose whatsoever, any of the birds or game mentioned in section one of this act, during the season when the catching, killing or injuring the same is hereby prohibited.

—The following letter from "Uncle John" is interesting, as showing the kind of game to be found in Colorado. For a more general article on same subject, see FOREST AND STREAM Vol. No. 10, page 147. That article, which originally appeared in this paper, went the rounds of the country, and finally came back to us credited to the Denver Tribune. There is nothing like going abroad to learn the news from home:—

PHILADELPHIA, March 4, 1874.

EDITOR FOREST AND STREAM:—

I inquired of a friend of mine in Denver City what kind of game there was in that country, as I intend to visit there for collecting specimens. He writes me that they have quail, prairie chickens, ducks of all kinds and geese, also jack rabbits, (long-eared hare). At the foot of the mountains can be found blue jays of different varieties, magpies, crows and ravens, and plenty of ptarmigan, called out there the mountain quail; these are found about the upper range among the timber. There also abounds abundance of sage cock (*Centrocercus urophasianus*) and quite a variety of squirrels, black, white, red and gray, and different species of gophers, bear, elk, deer, antelope, mountain sheep, lynx, wild cats, polecats, mink, badger, otter, prairie dogs, muskrats, weasels, &c. They caught the other day a singular little animal, sort of mixture between prairie dog, ferret and weasel, having a head shaped like a rattlesnake, about the size of one of our "cotton tails" (rabbits). It was more than a match for four dogs in capturing him. Yours truly, JOHN KRIDER.

—The Merry Mount Shooting Club of Quincy, Mass., participated in their first pigeon match under their present organization in that town on Thursday, April 2d. The members shot at ten birds each, twenty-one yards rise, eighty yards boundary, H and T trap, and governed by the rules of the Tremont Club of Boston. The following is their score:

	KILLED.	MISSED
O. H. Studley.....	0 1 0 0 1 0 0 0 1 0	3
P. Chubbuck.....	1 0 1 1 0 0 0 1 0 0	4
G. S. Buckley.....	0 1 0 1 1 1 1 0 0 0	6
Edw. Hardwick.....	1 0 0 0 0 1 1 0 1 0	4
Noah Curtis.....	1 1 1 1 0 0 1 0 1 1	7
Geo. W. Morfon.....	1 0 1 0 0 0 0 1 0 1	4
C. F. Pierce.....	1 0 1 0 0 1 0 0 0 0	3
W. E. Stables.....	1 0 1 0 0 0 1 1 1 0	5
Thos. Curtis.....	1 0 1 1 0 0 0 0 0 0	4
Frank Wilson.....	1 1 0 0 1 0 0 0 1 1	5
Geo. Monk.....	0 0 0 0 0 0 1 1 0 1	3
Sam'l Spear.....	0 0 1 0 0 1 0 0 0 0	2

Sam'l Bass.....	0 1 0 0 0 1 1 0 0 1	4
	61	79

A large number of spectators were present, but the day though pleasant was cold and windy, which accounts for the number of "misses" as the most of the above are noted as fine shooters on the wing.

—A call has been issued to organize a State Sportsman's Association in Ohio.

THE RIGBY RIFLE.—As this rifle made by Mr. John Rigby, of Dublin, is exciting a great deal of attention, it being the arm to be used by the Irish eight, at the suggestion of many of our readers we publish a brief account of the same. The Rigby is a muzzle-loader, and has a combination pistol handle stock. Diameter of bore 451; largest diameter 480. No. of grooves 7; grooving very shallow; lands narrow, about one-quarter width of grooves; uniform twist, one turn in twenty-two inches. The form of grooving renders it impossible it is said for the bullet to strip. Bullet 530 grains, hard metal, solid base, felt wads, powder 90 grains, Curtis & Harveys No. 6 (14 grains). False muzzle loader used. At an official trial at Woolwich, the low trajectory of two degrees, forty-four minutes at 1,000 yards was made with the Rigby.

EDITOR FOREST AND STREAM:—

As a careful observer of the development and growth of rifle practice in the United States, and having been a witness of its results in other countries, I offer you a few remarks on the subject.

I must express my satisfaction in recognizing from the general tenor of the remarks of your journal on the subject of rifle practice, that your advocacy thereof is based on a thorough and sound understanding of the true object to be gained therefrom, a point which should always be kept prominently before the minds of those whose co-operation in furthering the work is desired.

As a pastime simply, rifle practice, though a pleasant

sport, would not be worthy of the study of the able men of the country. Regarded as a discipline for the nerves, the muscles, and the brain, as an accomplishment, the obtaining of which shall place our military men on a far higher scale in the estimation of foreign powers, and as an important addition to the efficiency of the soldier when required for the defence of his country, it is worthy of the earnest advocacy of every man among us, and to this end our prominent men should support the movement with their influence and with their money. Mr. Bennett has recently come nobly forward to give an impetus to rifle shooting for the coming season, and his example should stimulate others. Prizes should be freely and liberally offered to the National Rifle Association, and everything done to aid the promoters of this enterprise which they have inaugurated; and such support will redound to the honor of our country, and to its prosperity in increasing the physical power of our young men. In regard to the Irish match for which I notice signs of preparation in various parts of the country, I would like to advise our distant friends to go into training at once, and with a will and business exactitude; to select their rifles, raise their targets with care, and to study thoroughly the theory of marksmanship; to become acquainted with the effect of light and shade, of wind and weather, of a rise or fall in the ground, and also to learn in what respects Creedmoor range differs from their own, and to assimilate their premises to it if possible. I could suggest much, but fear to trespass upon your space. I cannot but feel, however, that no effort should be spared, now that the international match has become a fact, to gain a triumph for the marksmen of our country. Such a triumph would give us cause for congratulation far more than we can at present imagine.—Yours, Vox.

—We have to thank our friend "Veritas" for another contribution to our larders. Twenty brace of English snipe are not received every day. He says, under date of April 8th:—"We have had truly royal sport at English snipe here in Virginia. The birds are in fine condition, as you will see, some of them being of extraordinary size. My friend and self, two guns only, bagged close up to three hundred birds in seven days or parts of days' shooting, balance of weather bad. Details of shooting I will write in another letter. Home to-night."

A BREECH LOADER.

BALTIMORE, Feb. 28, 1874.

EDITOR FOREST AND STREAM:—

In a former letter I referred to a central fire breech-loading gun made in this city. I now take up the "Sneider's patent breech loader." I will preface my remarks by saying that I have no interest, direct or indirect, in this gun, so I trust you will hold me guiltless of interested motives. I am writing this only for the benefit of my fellow sportsmen. I have always been a gun fancier, have owned many, examined and shot more, and while I do not claim to be an expert, I think I know a little something on the subject. I have always claimed that the "coming gun" would be an American one, and think that "Sneider's" comes nearer to it than any I have yet seen. Unfortunately there are many who think that nothing good can be made in this country, that clothes, guns, watches, &c., to be first class must be imported. Now I am an American in every sense of the word, and am proud of American productions and believe that we can make anything, especially in the mechanical line as well here as can be made anywhere. Many, if not most, of the valuable modern inventions are American, and why should we not make a first class gun? Our military arms are sought for by foreign powers and acknowledged the best. As a people we think and act for ourselves, do not follow in the same old rut, and most inventions are improved when taken hold of by us.

We are not willing "to let well enough alone," but are always thinking how to improve it. Mr. Sneider went over to Europe last year to order his barrels, but as they did not seem to get hold of his ideas, he forged some out himself and left them as patterns, and his barrels are made there of the best material from these patterns.

The peculiarity of his barrels is that they are very heavy at the breech, but do not carry the metal to the muzzle with a gradual taper (on the outside), but grow perceptibly lighter immediately above the chamber, then taper out gradually. Therefore the weight is where it belongs, well behind, and the barrel, being very thick there, is not weakened by boring out the chamber for the cartridge case, nor is the gun clumsy, as would be the case if the barrels tapered gradually to the muzzle and had the same weight at the breech as at present. The grip or fastening when the gun is closed is one of the very best I have ever seen, surpassing all others in strength and simplicity. It is at the extreme end of the barrels, thus giving more leverage and firmness than if nearer the hinge bolt, and it locks the gun both above and below, so that all jumping or jarring of the barrels, forward or up, when the gun is fired, is overcome or rather prevented. But to overcome any possible motion, he has a self acting compensator, which meets any wear which may take place of the bearings. By a simple attachment he relieves the hinge bolt from all strain when the gun is opened. This I look upon as a most valuable improvement. One of the principal objections I have heard made to the central-fire gun is that the extractor is apt to clog with rust or dirt, and I have several times had it happen to me when in the field, and could neither open nor close my gun. With most of them you have to take the barrels from the stock and unscrew the plate beneath the barrels to get at the extractor, and often this screen will be found rusted in. In this gun the extractor can be pulled out readily with the thumb and finger at any time, and by taking it out when you clean the gun and wiping it, all danger of clogging or catching is overcome. The gun is top-action, both snap and lever, so that if by any chance the spring should break you can still use the gun, but as the spring is flat and simple, and opened by the shutting of the barrels down upon it, I do not see how it can possibly break. These guns are said by sportsmen who have used them for a long time to shoot remarkably well, and the only objection I have ever heard made is that they are not finished so finely as the English guns, but I suppose you can get finish if you choose to pay for it. They fit close, and work smoothly, are beautifully balanced, of correct proportions and simple in construction, and as to the finish for my own part I prefer a gun perfectly plain without a scratch of engraving.

Your paper is read by most of the sportsmen here and acknowledged as authority. Every sportsman has his own peculiar ideas about a gun, and it is difficult to put these down on paper.

To benefit my fellow sportsmen must be my excuse for asking you to publish what seems very much like a puff, but I wish "to do unto others as I would be done by," and give them a hint; *verbum sap.* A sportsmen's club for the preservation of game is much needed, and I trust the gentlemen here will be stimulated by your efforts and form one. There are many enthusiastic and thorough sportsmen here, but there seems to be apathy about enforcing the game law. While they would not shoot out of season they decline to enter complaint. Quail are to be found in restaurants and hotels out of season, under the name of "short bills," and I regret to say that a gentleman told me at the Clubs also. Woodcock are shot and eaten in March and April. I agree with you that Mr. Hallock's resolution adopted by the American Fish Culturists' Association was admirable as far as it went, but I wish it could have been made to include game and other birds as well. Your paper is doing a noble work, and you have commenced none to soon, and I trust your efforts will be crowned with success. WANDERER.

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

Our Halifax letter on Canoe Cruising is unavoidably laid over until next week.

—At the expiration of each yachting season the entire fleet of beautiful little vessels which, all through the summer, has been such a decorative feature in our harbor, vanishes away. Where, no one man knows. Some go up the Hudson, some out in the Sound and many return to their builder's yards for protection during the winter. The foot of Court street, Brooklyn, has long been quite a popular rendezvous for a number of our yachts, both large and small, and a visit to this place at this season of the year will prove interesting to anyone of an aquatic turn of mind, showing not only how they are stowed away when not in use, but the preparations for the coming season. The amateur marine architect will also have an excellent opportunity of passing judgment on the "lines" of the smaller yachts which are usually hauled out each fall. To complete the winter arrangements, in the case of one of these smaller vessels, the sails are unbent and sent to its particular store house, together with all the running gear and moveable articles of any value, the cabin locked up and the masts coated with tallow, or whatever material appears best calculated in the eyes of the yacht's owner to preserve the spar from the influences of the weather. Then an examination of the manner in which she has been shored up takes place, and she is left, in all probability, not to be revisited until the ensuing spring. The larger boats go through the same process so far as sails, moveable articles and mast coatings are concerned, but are left in the water and snugly moored in such positions as will free them as much as possible from the drift of the ice. On board the very large schooners, one or two men, sometimes more, are left in charge.

But at this season, as we said, much more may be seen. Workmen employed in every possible way are scattered about, masts and spars being treated to a dose of the scraper, and in many cases, hulls too, screeching under the same instrument. Men with adzes are at work on new counters or overhangs and on new planks, wherever found, and they may be found everywhere in exact proportion to the owner's opinion of his own abilities as a naval architect and in nowise dependent upon the fact that the vessel has real faults and requires alterations. Painting, bending sails, reeving gear, removing canvas covers from gilded fiddle heads and stern ornaments—everywhere is bustle and activity among those vessels destined to be the "early ones." "The foot of Court street" is a peninsula, on the right hand a shelving shore which, when the tide is out, inclines one to the belief that our harbor is not sufficiently like the Bay of Fundy to float out one of the "little ones," even at high water, and on this side of the street may be seen all the yachts which have been hauled out; on the other side, however, is a wharf with apparently considerable depth of water alongside, and here are moored the schooners and those sloops which have remained in the water during the winter. Prominent among those on the right, probably from her proximity to the street and not from any individual merit, is the "Isabel," one of our sand-bag-racing-machines, a boat absolutely without draft of water, but with great bearings when heeled. She is evidently not intended to sail upon her bottom, as indeed one glance at her mast and bowsprit would prove. Beyond her is a whole nest of little sloops, ranging from thirty to forty-five feet over all, among which are the "Modesty," the pretty little "Idler," the "Lurline," the "Lizzie L.," the "Viking," which, from her sharpness of floor, we should suspect of having been a keel boat originally; the "Aquatia," open; and the "Lookout," half cabin. The "Edith," cabin sloop, seems to have been the first under way this spring, as she is already launched and equipped.

Passing around Mr. Munn's shop we came first to the "Nimble," a very able looking sloop of about forty feet, and next to her Mr. G. L. Haight's "Genie," new last season, was being launched, having been improved in appearance during the winter by the addition of an overhang of about four feet. Ahead of her was the "Marquita," Mr. Chuver, looking very saucy in her coat of black paint and gold stripe; and alongside the last mentioned boat was a very pretty little cabin sloop twenty-nine feet long, which Mr. Munn has just finished and which we believe is for sale. Still further down the street may be seen the "Nautilus," "Susie P." and some others of about the same size. The celebrated "Lee," a boat very much like the "Isabel," is shining with black lead near by. Coming back the street and turning our attention to the vessels in the water on the wharf side, we saw the "Meta," which is being altered into a schooner, her performances last fall on her unintentional cruise down the coast perhaps having decided her owner that he preferred his canvas in smaller pieces; her foremast is going in about two feet forward of the old mast hole, and her main mast will be stepped, leaving twenty feet in the clear between the two. We should judge that her sticks will be of about the same weight and length as those of the

"Triton," which is lying just astern. Mr. Havemeyer's steam yacht "Emily," is moored beside the "Meta." The "Emma T," turned out of Mr. Munn's shop last spring, has had her mast shifted about two feet further aft, which we imagine will prove a beneficial change, as it will place the spar in a position where the boat will be better able to carry it; and if proper changes are made in the cut or dimensions of the sails her "hang" need not be affected. Alongside the "Triton" was the "Peerless," Commodore Maxwell, scraped outside to the water line and ready for her paint. Beyond the last two was the "Addie" sloop, recently purchased by Messrs. Cornelius & Hilborne L. Roosevelt. We presume she will henceforth sail under the colors of the Seawanhaka Yacht Club, as both these gentlemen are members of that organization. We next came to another bunch consisting of the "Christine" and "Undine" sloops, and the "Mystic" and "Scud" schooners, all looking as if very little preparation would be required to fit them for active service. And last, right abreast of the boat house of the "Alcyone" Club, was the "Dauntless," Commodore J. G. Bennett, with stages over the bow and a gang at work on her head gear. She will have a running jib boom when she next makes her appearance.

A NEW STEAM YACHT.—Mr. Jacob Lorillard is now having built at the yard of Mr. James Lennox a handsome steam yacht, which is expected to attain unrivalled speed. She was designed by Mr. Robert Fish, and like most of his vessels, gives one the impression of being all ends; they are very pretty ends however, her entrance being uncommonly fine and her run simply beautiful. With more beam than is usual in a vessel of her length and as little draft as is possible, it becomes a puzzle to determine how she gets the sharpness of floor which is apparent at a glance. Her stern, which is of the English overhang type, is graceful and delicate in appearance and merits especial praise. A glance at the outline of her sheer plan as she lies on the stocks, is also very satisfactory, until one draws in imagination her load water line, when it becomes apparent that from the midship section her keel takes a shoot up in a gradual curve until at her fore foot, her draft of water is absolutely only six inches—this is discouraging to any one who pictures her in sea way.

We presume Mr. Fish's idea was to make her steer more readily, but it seems questionable whether that is as important as that she should get somewhere, when once pointed, if there is any sea on. That she will be very fast in smooth water there can hardly be a doubt. Her dimensions are—length, 86 ft. over all; 75 ft. on keel; moulded beam, 15 ft. 9 inches; draft aft, 4 ft.; forward, 6 inches. She will have compound engines, and we think will be the first steam yacht in this country, in which they have been introduced. The diameter of her screw will be 4 ft. She will be schooner rigged, the masts about 75 ft. in length.

—The sloop yacht "Fannie," built by Cronett, of Fifty-first street and North River, for Mr. H. Steimers, of Germany, is finished. She is 22 feet long, 8 feet beam and 2 feet 8 inches in depth; mast 25 feet, boom 25 feet, gaff 14 feet, centre board 5 feet. She will be sent across the Atlantic in a few days on the deck of a steamer.

—The sloop yacht "Coquette" has been sold by Mr. G. H. Brockway, and goes to Savannah, and in turn he has purchased the sloop "Undine." The latter is being repaired at Bates' yard, South Brooklyn, and will be added to the fleets of the Columbia and Long Island Clubs.

—The new schooner yacht building at South Norwalk, Conn., for Frank Burritt, has been named "Estelle."

DORCHESTER YACHT CLUB.—The first regular meeting of the season of this Club was held at their club house, in Ward 16, Boston, on Friday evening last, and the following named officers were chosen:—Commodore, W. H. Bangs, Jr.; Vice Commodore, Charles E. Fuller; Fleet Captain, Parkman Dexter; Secretary and Treasurer, W. H. Sayward; Measurer, William W. Lewis. Regatta Committee, W. H. Bangs, Jr.; W. F. Halsall, Coolidge Barnard, Walter Burgess, Wm. A. Gilbert. Trustees, Charles E. Folsom, Wm. T. Adams, W. H. L. Smith. Commodore Coolidge Barnard, who has held the position of Commodore so acceptably for the past three years, was re-elected, but declined, and W. H. Bangs, Jr., Esq., late Secretary, was chosen. The club is in a very prosperous condition, numbering 170 members and above 60 yachts. They will probably give five regattas this season, the first one about the last of May, to be open to the yachts of the Boston Yacht Club, the starting point and judge's boat to be stationed off their new club house at City Point as a compliment to them. The prizes, for which the yachts of both clubs will compete, will be furnished by the Dorchesters.

BOSTON YACHT CLUB.—Thursday last, the first meeting of this club in their new club house at City Point, South Boston, was held. Commodore Oran, on taking the chair, stated that though the business consisted principally in the sale of the lockers, it was made formal, that it might become a matter of record. This new club house is a two-story and a half structure, 70x40, built on piles some 300 feet from the shore and connected with the same by a wharf—a portion of which they have leased to the Messrs. Lawley for the purpose of boat building. The first floor is occupied by lockers, the second by a spacious hall, committee room, kitchen, and ladies' retiring room, and above this, an attic. Around three sides of the first and two of the second are wide piazzas, from which splendid views can be had of the yachts and harbor. There is plenty of available room for

moorings off the house, and last year 108 yachts made it their home. The club now has 249 members, and a large number will be proposed at the next meeting. The following is a correct roll of the yachts, owners, &c., now enrolled in the club:—

Name.	Owners.	Port.	Lg' h over all.	Lg' h w'r line.	Ke'l or C. B.	Rig.

—Among the new yachts enrolled in the Boston Yacht Club since last season is the renowned yacht "America," which now hails from Gloucester, and is owned by General Benj. F. Butler and Col. Jonas H. French. There are also the schooner yachts, "Dolly Varden," belonging to Joseph Arcan; "Trouble," to H. A. Hallett, et al; and the "Wivern" to Nath'l. Wales, all of Boston. Among the sloops are the "Fanchon," owned by Walter Burgess; "Firefly," by Geo. H. Balch; "Fearless," by John A. Woodward; "Hesper," by Louis G. Hale; "Ida Bell," by George W. Smith; "Jennie," by W. H. Bangs, Jr.; "Lady Clara," by Chas. W. Reed; "Owl," by A. Cunningham; "Pearl," by A. C. Martin, all of Boston; the "Ariel," of "Mattapoisett," by John C. Rhodes; "North Star," of New Bedford, by Thos. Nye, Jr.; and "Whistler," of Fairhaven, by Hon. John A. Hawes. A full and authentic list of the yachts of this club is being prepared and will be published in an early issue. Captain Nickerson's yacht "Sunbeam," is already at her moorings, and the "Veritas," Captain West, was launched last week.

—Arthur Cheney's steam yacht "Anemone" is at the water's edge near the South Boston Club House, and will soon be launched. She received a new boiler, good for 140 pounds of steam, last fall, and has the past month under the masterly hand of Robert Bibber been furnished with a new shaft and propeller. It is estimated the improvements will make her speed an hour faster.

—The Genesee Boat Club, of Rochester, has elected the following officers for the ensuing year:—President, A. Bronson, Jr.; Vice President, James H. Ellis; Secretary, John Dunlavy; Treasurer, M. M. Hollister; Captain, James H. Ellis; Trustees, A. Bronson, Jr., A. Christy, W. P. Nixon. First crew—M. M. Hollister, bow; James Healey, number 2; James A. Lock, number 3; A. Christy, stroke. Second crew—James H. Ellis, bow; George H. Chamberlain, number 2; Joseph Hardy, number 3; John Dunlavy, stroke.

—Georgé Brown, of Halifax, N. S., has received a challenge from Coulter to row a five-mile race at Toronto on the 29th of June, for \$1,000 a side. The challenge will likely be accepted. Another match has been arranged between Brown and Fulton of St. John, in Halifax Harbor, some time in June.

—The Messrs. Pierce, Bros., at City Point, South Boston, have nearly completed a new centre board sloop yacht 25 feet over all, 22 feet on water line and 10 feet beam. She is a splendid model and appearances indicate that she will prove as intended, a fast sailor, or, as a yachtsman, in view of her, aptly remarked: "She is threatened with speed." Purchasers are not wanting, as several parties are trying to make terms for ownership. She has many new improvements, as her builders are not wanting in originality.

—The Winnisimmet Boat Club, of Chelsea, Mass., at their annual meeting, elected the following named officers:—President, A. S. Harris; Treasurer, E. A. Fellows; Secretary, W. R. Eagnall, Jr.; Captain, F. W. Snow; Lieut., George Baldson.

ARIELAND STORM KING.—Various voluminous documents referring to the scrub race between the yachts Ariel and Storm King having been submitted to us, we append our decision. Space will not permit us to print all the papers and letters from the different judges and the gentleman afterward elected—Commodore Benj. Dean, of the Boston Yacht Club—to decide between them, and whose decision is quite exhaustive and

written as of one who is perfectly familiar with the subject in question. But, as we understand the case, it was simply this: A scrub race was appointed for a certain day, and the use of oars absolutely forbidden, which was the only restriction imposed upon the competitors. The yachts got under way, Ariel soon taking the lead and keeping it throughout the entire race. On the way home it fell a flat calm, both vessels drifting towards the stake-boat. To avoid a steamboat, it is said, Ariel let go her anchor, getting it, however, before she had time to swing. Storm King claims race on technicality of Ariel having let go her anchor. Ans. The Ariel wins. The only definite restriction in the agreement between the yachts, was against the use of oars or sweeps, but we fail to see how letting go anchor under foot in a fair-going tide is to accelerate the speed of a yacht. So much for the special agreement governing the race. Under ordinary regulations the Ariel would still win, as the general ruling of clubs here and in England permits a yacht to anchor during a race, provided she gets her anchor again. And under general rules the Ariel would have another claim to the prize, from the fact of the Storm King having thrown ballast overboard.

—We are requested by the Saratoga Rowing Association to print the following card:

SARATOGA ROWING ASSOCIATION.

It is necessary for the Saratoga Rowing Association to have the address of every amateur rowing club of good standing in the United States and Canada. The Association propose to issue soon its circulars concerning its annual regatta, which will be given some time in August. Therefore it is to be hoped that all rowing clubs will send their address, giving name of President and Secretary, so that none may be overlooked, nor fail to receive circulars. Address

SARATOGA ROWING ASSOCIATION,

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

THE BASE BALL GUIDE FOR 1874. By Henry Chadwick.

This hand-book contains the scores and other information of all recognized professional and amateur clubs in the United States, as well as hints to amateur base-ball clubs on batting, throwing vs. pitching, base hits, earned runs; also a diagram of a base-ball field. Published by Robert M. DeWitt, 33 Rose street, New York. The well known proficiency of the author in all matters pertaining to the subject, will entitle this work to the rank of standard authority.

THE LIFE AND PUBLIC SERVICES OF CHARLES SUMNER.

By Elias Nason, author of "Life of Henry Wilson," "Gazette of Massachusetts," &c. Boston: B. B. Russell.

We can give no better utterance to our own thoughts, in view of this chastely written history of the life, character and public services and private worth of Charles Sumner, than stands fitly embodied in the author's preface. In every age men have arisen, and by the force of an original genius and a lofty aspiration, have come to stand as heralds in the fore-front of national progress. Such an one in an eminent degree was Charles Sumner. Standing grandly, like a tower of strength among his fellows, his golden words, often fraught with prophetic reality, will ever be remembered, while his memory will never fade so long as real goodness and true patriotism has a name within the American Republic. In the past great struggle—the "impending conflict," he stood forth like Moses of old, as a leader of the hosts of right. In this forthcoming work by Mr. Nason, you will read of him as the foreordained prophet, the great leader, the sure counsellor, the unflinching, never-failing friend of humanity. How valuable is the study to all our young men, at this time of Credit Mobilier looseness, it is to read of an honest man like him; it is like a glimpse of better times coming, though it may be in the far off future of the history of the nation.

We shall notice this valuable work at another and better opportunity. This work is published on clean white paper, in fine type and fine style and binding, and will be ready for delivery in a few weeks.

FIELD ORNITHOLOGY. Comprising a Manual of Instruction for Procuring, Preparing and Preserving Birds, and a Check List of North American Birds. By Dr. Elliott Coues, U. S. A. Salem: Naturalists' Agency. 1874. 8vo, pp. (mamal) and 137 (Check List).

Although aware of Dr. Coues' great industry in his favorite pursuits, we were hardly prepared for another treatise from him so soon after the publication of his Key. That work being altogether to teach the technicalities of the science, in this work he evidently meditates finishing the student's instruction by telling him all about practical ornithology. He takes his pupil into the field, and shows him exactly "how 'tis done." While it is quite unnecessary to speak of Dr. Coues' attainments in the technicalities of zoology, we must not suppose he is only a musty closet naturalist, redolent of old books and sesquipedalian words; he has been an ardent and diligent collector for many years, almost all over the country, shooting and preparing with his own hands thousands of specimens which are now found in nearly all large collections. In Field Ornithology we have the results of his practical experience in the collection and preservation of specimens. Throwing off his scientific robes and leaving his technicalities in the desk, he goes at ornithology in a shooting jacket, and in familiar, conversational style, tells what he knows about field work. Beginning with choice of guns and equipments, and getting his scholar ready, he takes him into the field and shows him what to do. No work of this country compares with the present in extent of ground covered, or in variety and usefulness of the suggestions for field work. This part of the treatise is a complete initiation into the mysteries of woodcraft; it handles every topic from how to steal on a wary bird, to a reason for not drinking whiskey. Having made his bag the student is carried home, and shown in the most complete manner how to skin, stuff and mount his specimens, as well as how to take care of them afterward. Dr. Coues' well known happy faculty of going straight at a subject and hitting it off was never better shown than in this treatise, which will indeed enable anyone to become proficient in collecting and taxonomy.

The Check List gives the scientific and common names of all the birds of North America, arranged according to the approved classification of the Key. Being printed on only one side of a page, there is a large blank space opposite each name, which may be very conveniently used to record field observations and register specimens. The names are also printed in thick display type, serviceable for labeling collections, for which purpose the list is issued cheaply as a pamphlet to be cut up. Altogether this is the handiest and most eligible work on the subject which has appeared in this country, and one which no sportsman or collector should enter the field without possessing. Its compact size and very low price are additional recommendations. We shall ourselves use the nomenclature in our columns, and can confidently recommend the book as entirely suited to the requirements of every lover of dog and gun.

—Mr. Charles H. Taber, an employee in the freight department of the New Bedford Railroad, while digging clams on Monday at Willis Point, found one of the bivalves wearing a gold finger ring on its snout, with a number of initials engraved on it. It had probably been discarded by some one of the many persons that have been baptized in that locality.

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

Sirs—A friend of mine sent me, with a transport of Indian Skins, two pounds of "Vanity Fair," which I declare to be the best Tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair" is the King of all, by its aromatic flavor and the right sort of strength. My friend in New York got an appointment in California, by that reason I apply immediately to you, begging you to send me for the enclosed ten dollars, a supply of "Vanity Fair," and send with the next steamer to Germany. If there is a German firm that sells your excellent "Vanity Fair," I beg you to enclose me the address.

BREECH LOADING GUNS
A SPECIALTY.

We would call the attention of the public to our large assortment of

Breech-Loading Shot Guns,

Manufactured by the following celebrated makers: Messrs. W. & C. SCOTT & SONS (winners at the International Gun Trial of 1873); P. WEBLEY & SON, W. W. GREENER, WESTLEY RICHARDS, J. HOL- LIS & SONS, and other makers.

A full line of fine PISTOLS AND RIFLES CONSTANTLY ON HAND. DIXONS & HAWKSLEY'S SHOOTING TACKLE. To insure good shooting from Breech-loading Guns, we would recommend the use of the

STURTEVANT BRASS SHOT SHELLS, manufactured by the Union Metallic Cartridge Co., Bridgeport, Conn. These shells are the cheapest and best in the market, can be easily re-capped with ordinary caps, without the use of the implements necessary in priming all other styles of shells. BUSSEY'S PATENT GYRO PIGEON AND TRAP, WITH CASE, AND 100 BIRDS.

Black's Patent Cartridge Vest.

This Vest affords the best arrangement yet in rying cartridges, so evenly distribu- scarcely felt. Car- tridges can be heads down in this vest, which is tance when brass as when carrying head up the weight en forces the wad bad shooting is the In ordering send measurement around the chest. Price \$7.50.

AGENTS FOR THE Union Metallic Cartridge Com- pany's Ammunition, WARRANTED THE BEST IN THE MARKET. SEND FOR CIRCULAR.

New Work by Dr. Cones.

Field Ornithology.

A complete treatise on collecting birds and prepar- ing them for the cabinet. Covers the whole ground thoroughly, enabling the tyro to become an expert Taxidermist. This is the

Standard Treatise on Taxidermy.

IT ALSO INCLUDES A Check List of North American Birds, Classified and named according to the Key to N. American Birds. Manual of Instruction and Check List together, beautifully bound in fine cloth. \$2.75. Check List alone, pamphlet, printed to cut up for labeling specimens, and for recording field observa- tions, 75 cents. NATURALISTS' AGENCY, and booksellers generally. Salem, Mass.

BOUGHT, SOLD, EXCHANGED, AND ON HIRE. Special attention paid to Fine Guns and Breech-Loaders, &c. Repairing of every descrip- tion a specialty.

Goods sent everywhere by express, marked C. O. D.

HOME! HOME!! HOME!!!

At Flushing, six miles from New York; 103 trains daily from 6 A. M. to 12 at night; a yearly com- mutation ticket free.

(Fare 8c. by package tickets.) For sale, a French slate roof House, filled in with brick; gas, water, marble mantle; good closets; sewer connections, with double plot of ground, guttered and flagged. Price \$4,000.

The owner intends to sell, and any party who can invest in a home, from \$500 to \$2,500, will address Box No. 142 Post Office, obtain a free pass to Flushing and full particulars. Feb-2

Sportsmen's Goods

REMINGTON'S

Sporting, Hunting and Target Breech-Loading

Rifles and Shot Guns.

Long Range Match Rifles for "Creedmoor" Shoot- ing, now ready. The same as won the "Turf, Field and Farm" Badge, Aug. 2, and "Ama- teur Rifle Club" Badge, Aug. 9. See re- ports. Unequalled for accuracy by either Breech or Muzzle-Load- ers of other makers.

For simplicity of mechanism, ease of manipulation, quality of workmanship and material, accuracy of range, and penetration, WITHOUT COMPARISON.

"It is a noteworthy fact that though many different kinds of rifles were used in the several matches, includ- ing the converted Springfield, Remington, Metford, Ballard and Ward Burton Rifle, every prize in all the matches was won by those who fired with the Reming- ton rifle, except the last."—From N. Y. Times, June 22, 1873.—(See full report.)

The Remington Rifle won Twenty-two out of Twenty-three Prizes at the Creedmoor Meeting, June 21, 1873.

Also, Revolving, Repeating, Deringer, and Vest Pocket

PISTOLS & RIFLE CANES.

—OUR—

Double Barrel Breech Loading Gun IS NOW READY.

The best ever offered, containing all the most desir- able features of the best imported, together with some valuable improvements peculiar only to this gun. Top Snap action, half-cocked, breech opened and shells ex- tracted by one motion.

E. REMINGTON & SONS, 281 and 283 Broadway, N. Y. OR, ARMORY, ILION, N. Y.

CUT THIS OUT AND SEND FOR ILLUSTRATED PRICE LIST.

This arm was submitted in competition with over one hundred different systems, American and Euro- pean. to the Board of United States Officers, appoint- ed by Act of Congress, 6th June, 1872, for the pur- pose of selecting the best arm for the service, and of which Brig. Gen. A. H. Terry was President. It suc- cessfully passed through all the tests.

The following is the report of the Board: "Resolved, That the adoption of magazine guns for the military service by all nations is only a question of time; that whenever an arm shall be devised which shall be as effective as a single breech-loader, as the best of the existing breech-loading arms, and shall at the same time possess a safe and easily manipulated magazine, every consideration of public policy will re- quire its adoption.

Resolved, further, That the experiments before the Board with the Ward-Burton Magazine System have so impressed the Board with the merits of this gun, that they consider it as more nearly fulfilling the con- ditions above specified than any other tried by them or of which they have any knowledge, and it does recommend that a number of magazine muskets be made on the plan for further trial in the field." (See Ordinance Report.)

We are now making these guns to supply the nu- merous demands, and will soon have them in the market.

The following is our scale of prices: Special Maga- zine for large game, carrying from 3 to 8 cartridges, 70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10 lbs. weight, from \$60 and upwards, according to finish. Special Long-range Magazine Rifle for Creedmoor shooting, 90 grs. of powder. 480 grs. of lead, carrying 3 to 8 cartridges, weighing 10 lbs., from \$100 and up- ward. Magazine guns for general use, carrying 8 to 9 cartridges, 60 grs. powder, 350 grs. lead from \$40 and upward. Single Breech-Loader, Creedmoor shooting, for long range, 90 grs. powder, 480 grs. lead, from \$60 and upward. Single Breech-Loader for general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead, from \$30 and upward. The calibre of all our rifles, unless otherwise ordered, will be 45-100. in.

FOREST AND STREAM

A Weekly Journal,

DEVOTED TO

Out-Door Sports

Hunting, Fishing, Yachting, Boating, Practical Nat- ural History, Fish Culture, &c. &c.

It is the OFFICIAL ORGAN of the

FISH CULTURISTS' ASSOCIATION OF AMERICA.

The Publishers of FOREST AND STREAM

In order to stimulate the development of

MANLY and ATHLETIC EXERCISES,

AS OF

FISHING, SHOOTING, ARCHERY, CRICKET, FOOTBALL, and CROQUET,

Offer the following prizes for clubs of three or more.

Single Subscription per Annum \$5

Starting Clubs.—Agents, and others interested, are advised that we do not insist upon their starting with full clubs to secure our rates. They can send three or more at a time, and on forwarding the requisite number within 60 days will be entitled to same premi- ums as if all were sent together.

CRICKET.

For \$20 00 four copies, one year, with one best spring bat, one College bat, one Dark cricket ball; price \$7 50.

For \$25 00, five copies, one year, with a complete cricket set; one College bat, one polished bat, Clap-shaw; one Dark cricket ball; one set of stumps; price \$12 00.

FOOTBALL.

For \$15 00, three copies, one year, with one Rugby football; price \$6 00.

FISHING RODS.

For \$15 00, three copies, one year, with one superior four joint light rod, suitable for all kinds of fishing; price \$7 00.

For \$60 00, twelve copies, one elegant rod; suita- ble for trout, black bass with fly, or for trolling bass or pickerel; as fine a rod as can be made; German silver tipped, with three tips; price \$25 00.

CROQUET.

For \$20 00, four copies, one year, with very hand- some set of croquet; price \$7 00.

For \$25 00, five copies, one year, with superb set of croquet; price \$10 00.

For \$30 00, six copies, one year, with the finest set of croquet made; price \$14 00.

REMINGTON RIFLE AND SHOT GUN.

For \$75 00, fifteen copies, one year, with one Rem- ington Deer rifle; price \$38 00.

For \$100, twenty copies, one year, with one Target rifle, 30-inch octagonal barrel, to be used for sporting, hunting, or target shooting; price \$36 00.

For \$100, twenty copies, one year, with one Rem- ington double barreled, breech-loading shot-gun, one of the best guns ever offered to American sportsmen; price \$45 00.

SHARPE RIFLE.

For \$100, twenty copies, one year, with one Sharpe sporting or target rifle, best quality; price \$40 00.

WARD-BURTON RIFLE.

For \$200, forty copies, one year, with one Ward- Burton rifle magazine gun for large game, price \$0 00.

SINGLE AND DOUPLE BARREL MUZZLE LOADING SHOT GUNS.

For \$20 00, four copies, one year, with one American single barrel gun, perfectly safe, blue barrels, walnut; price \$10 00.

For \$35 00, seven copies, one year, with one Ameri- can double gun, handy and reliable gun every way; price \$18 00.

For \$50 00, ten copies, one year, with one double boys' fine twist barrel gun, a safe gun every way for boys; price \$26 00.

For \$75 00, fifteen copies, one year, with double gun, English laminated steel barrels, handsome fin- ish; price \$45 00.

CASH PREMIUMS.

To those who prefer cash premiums a discount of 25 per cent. will be made on all clubs of three and up- wards.

Every article is of the finest quality and will be sent free of expense.

Remitting Money.—Checks on New York City banks and bankers are best for large sums; make paya- ble to the order of FOREST AND STREAM PUBLISHING COMPANY, 103 FULTON STREET, NEW YORK. Post Office Money Orders for \$50 or less are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the post- master, and take his receipt for it.

Send the names with the money as fast as obtained, that subscribers may get the paper at once.

For Forest and Stream.
"I AND BETSEY."

A TRUE COPY.

BY MRS. EUNICE B. LAMBERTON.

WHEN more than half of old York State
Was but a howling wilderness;
(If hunters all could have their wish,
'Twould be the same to-day, I guess),
There lived in cabin hewed of logs
A lusty farmer and his wife,
Contented, as the most of folks,
To jog along the road of life.

Their hands waxed hard and faces browned
From toil's fatigue and comforts few;
They dug their bread from out the soil,
And that was all the wealth they knew.
The sound of sturdy axe full oft
Re-echoed through the forest glade,
While panthers' scream and wild cats' yawl,
Made rife the midnight serenade.

No stairs encumbered their abode,
Economy of space they sought,
With safety, too, from casual foe,
When slumber's spell its lethargy wrought.
A ladder hanging from a peg,
A gaping ceiling with intent,
And glimpse of skylight overhead,
Divulged the secret of ascent.

One morning in the early spring,
When rivers burst their icy chain
And freshets tearing on their way,
Are swollen by the laughing rain,
Old Bruin, startled from his nap,
Forsook surprised his winter lair,
Nor halted till the savory broil
Revealed—alack! our worthy pair.

Their minds on matin meal intent,
Unwarned of danger nigh, reposed;
Till creeping shadows long the path,
And snuff the grizzly coat disclosed.
As quick as thought the only door
Was rivetted by hanging pin
That primitively hung at rest,
Beside the ancient log within.

But all in vain, an open space,
Like giant's eye, stared full and round,
Conveniently arranged for use,
Just far enough above the ground
For Ursus' head to entrance make,
To cast a wistful sidelong glance,
While cogitating in his mind
A further method of advance.

As matters reached this crisis dire,
Our good man left his loving wife,
Climbing instant, gasping forth
(Thinking to save his precious life
By pulling up the ladder too)
"Why, drive the critter down the lane;
Don't stand there quaking like a dunce
When there's the axe, my Betsey Jane."

Though frail of form, now stout of heart,
Wielding the weapon with a skill
That erst had made a yeoman blush;
For "when a woman will, she will"—
The blows descended thick and fast
Upon his bearship's shaggy head,
Till Coroner, from up aloft,
Pronounced the ugly monster dead.

When neighbors flocked in rustic style,
For news takes wings, though miles divide,
To prove by perfect measurement
(While modest Betsey stood aside)
Nine cubic feet from tip to tip,
Her lord and master comment chilled,
By uttering the potent words,
Behold what *I and Betsey* killed!

Rochester, N. Y., April, 1874.

—Shad are so plentiful on the St. John's River at Mellonville, Florida, that they can be had at five cents each, or one dollar per barrel. Farmers are buying them for manure.

—The privilege of fishing on the bridge between Bucksport and Verona, Maine, this season, has been sold for \$649, which is more than double the price paid last year.

For Forest and Stream.
Our Okeechobee Expedition.

DISCOVERY OF THE LAKE—THE GREAT MYSTERY SOLVED—
SWAMPS, MARSHES, ALLIGATORS AND SNAKES—NO RUINS
—NO CASTLES—NO ROMANCE—AN IMPENETRABLE JUNGLE.

St. Lucie, Friday, March 18, 1874.

IT gives me pleasure to announce the success of my expedition to Lake Okeechobee and the Everglades.

I left St. Lucie, Indian River, the 14th of February, and returned March 17th. I hasten to send you such information regarding the lake and route as I have time to write while the mail boat is waiting. As before stated it was my intention to have my boat transported to the Kissimmee River, and sail down that river into and around Lake Okeechobee.

This plan has been adhered to, and has resulted in a complete success. Of all the parties started for Lake Okeechobee, this winter—and there seems to have been many—ours is the only one that has penetrated the Everglades and explored the lake. It is, in fact, the *only* party that has sailed completely around the lake, and brought from thence authentic information regarding its topography and natural productions. The lake, as the readers of FOREST AND STREAM are aware, is the largest in the South. Probably less has been known of this lake than of any body of water of like size in the Union, owing to the impassability of the country about it, and the alleged hostility of the Indians upon its borders. During the Indian war of 1835-'43, boats crossed it upon two occasions, ascending and descending the Kissimmee River, and scouting the cypress swamps in search of Indians. In the war of '56, '58 forts, or military stations, were located as near the lake as the character of the land would permit, and it was frequently crossed, and no doubt, pretty thoroughly explored. But the soldiers of the last Indian war were principally militia, natives of the country, and but little knowledge of the lake was disseminated through them. Since that time Okeechobee has remained veiled in obscurity. No one but the Seminoles knew the character of its shores or the productions of its waters. The mystery surrounding it has been unbroken, nothing has been really known of it, until our boat was launched upon its waters. The State engineer of Florida, in 1855, expressed the opinion generally held regarding the country about the lake, when he wrote: "These lands are now, and will continue to be, nearly as much unknown as the interior of Africa, or the mountain sources of the Amazon."

Fabulous stories of beautiful islands, picturesque ruins and pirate-haunted glens, have been much in vogue with writers upon Lake Okeechobee, and to lift the veil that has so long hung over it, and narrate the plain facts is to deprive them of a seemingly inexhaustible fund of romance.

I must confess that it pains me to do so, but fidelity to truth compels me to write of the lake as it is, and not as it should be. The beautiful groves of tropical fruits, the monkeys, spiders of gigantic size, and ancient ruins, are among the things that were *not*.

There is but one practicable route to Lake Okeechobee, that *via* the Kissimmee River. There are, however, two routes to that river, and for the edification of the future traveler to the lake I will describe them. A good boat, provisions, and everything necessary for a month's stay, are necessary by either. The one I adopted was, as stated, from Indian River, at St. Lucie, across the country, to the location of old Fort Bassenger, on the Kissimmee River.

The first ten miles is through a low open pine woods, very wet in the winter months, through which flows two deep creeks, the "Five-mile" and "Ten-mile." From Ten-mile creek the course is north of west for twenty-four miles, at first over the Alpatie Flats, submerged as late as March, and dry and alkaline in the dry season, later, a short wiry grass covers them, and shallow ponds, dry in the dry season, occur at intervals. The clumps of cypress

here are characteristic of this section, being in long curving lines, resembling mountains at a distance. At intervals of half a dozen miles, pine islands occur, with opportunities for camping.

Sixteen miles from Ten mile Creek, twenty-six from St. Lucie, the prairies of the St. Johns' are taken and kept until the old military road from Fort Capron to Tampa is struck, when the course is due west for five miles through a belt of timber to the Kissimmee Prairies. This belt runs nearly north and south, separating the prairies of the Kissimmee from those of the St. Johns' and the Alpatie Flats. The road over the prairies is rather obscure, as also is that to the timber upon the other side, but easily followed by a woodsman.

The course is south west. The prairie is dotted with pine "islands," the last one (in which lives the only settler on the route, Judge Parker) is over two miles in width. The Kissimmee at the ford is about fifty yards wide, though it sometimes overflows its banks for two miles upon the eastern side. We had to wade a mile before launching our boat.

The other route is from Lake Jessup, or Winder, on the St. Johns' to Lake Tohopekaliga, or Cypress, the head waters of the Kissimmee.

It is said to be about forty miles over land, and one hundred and forty down the river to Bassenger. The settlers near the river knew nothing of the distance from the Fort Bassenger ford to the lake, but thought it to be sixty miles.

We found it about fifty-five miles, and it took us two days to reach the lake. The river is extremely crooked, the current swift, and the water the best in south Florida. The width at the ford is maintained throughout almost its entire length, though narrowing in places near its mouth. During the first thirty miles are occasional live-oaks and maple bluffs, but beyond that the river ran through vast plains of cane and saw grass and between low willows. Many lagoons make up from the river. Isolated clumps of magnolia grow in the marsh, appearing like large trees at a distance. Ten miles from the ford is a settler's cabin, the last on the river. Twenty miles from the lake is the last oak, and three miles from the lake a large cypress from which a view of the lake can be obtained.

The Kissimmee, as it enters the lake, forms a bay a mile in width and depth, filled with lilies and water-lettuce. There are two cypress trees near its mouth, but all around is marsh. The most conspicuous birds on the river have been the limpkin, or crying bird, the white ibis, white heron, snake bird and vulture. Black bass are plentiful and large, perch, cat-fish and bream also abound.

All the way down, on either side, is a pine ridge, from three to five miles away, sometimes approaching the river. It spreads out as it nears the lake, and maintains the same distance on the west side, and merges itself in the cypress bordering the eastern shore. It is a little over a mile to the first projection of the bay, west, where cypress and grass shoals present a dreary appearance. Back of this, however, is a drift of sand upon which grows a thin belt of elm, maple and elderberry, interlaced and overgrown with large grape vines. Back of this sand, which must be covered at high water, is a dark lagoon, filled with alligators. A large fish-hawk's nest, here, induced us to call this place "Osprey Point."

A mile further is a camping place used by Indians when hunting all cypress. The sand is here six inches above the lake and a quiet lagoon affords shelter for a boat. Detached belts of cypress and marsh occur next, and the only place suitable for camping is ten miles south-west. We called it Mulberry camp, from the occurrence of that tree there. Besides mulberries there are ash, maple, box-wood, cypress, India rubber and elderberry. There are gigantic cypresses here, six feet in diameter, completely enclosed in the India rubber, and covered with ivy.

The shore trends south-west for about fifteen miles from the Kissimmee, where a long cypress hammock ends in a lone palmetto. Here a deep bay makes in some three miles, and is about five miles in width. At the end of this bay, the palmetto spurs from the main ridge approached

within a mile. All south of this is an unbroken marsh, deeply indented with bays, from which blind creeks or "sloughs" ramify in every direction.

Due south of this palmetto point is a low willow island, with but a few inches of sand above water, covered with nests of heron and snake bird.

A marsh extends to this island, and south of it is another deep bay. Below this island the shore trends southward for about eight miles, then the dip is south-east, a desolate region, with a low dark line of willows bordering the shore. It has a very deceptive appearance, this same shore, as various shades from the light of the grass shoals to the dark of the willows, make it seem very high, and the traveler is only disenchanted by a close inspection.

About thirty miles south by west of Kissimmee is the only island in the lake affording foothold to man. It is one and a half miles long and four miles from the south-west shore. It runs north-west and south-east, and is dry upon its eastern or lake side, and marshy on the western, or shore side. It is no where more than a foot above the level of the water, a dry sand ridge covered with India rubber, ash and sweet bay, with a few paw-paws in fruit and flower. Nearly half an acre, at one end was covered with vines of the wild gourd. Upon both sides and at either end is a thick growth of willow, with some cypress. The northern end is covered with the dark vines of the *ipomea*, in which hundreds of white herons and spoonbills have built their nests. From a tall cypress, here, the shore can be traced for many miles, nothing but marsh and marsh for miles, with a few palmettos, spurs from the main ridge some five miles back. Due south of this island is a sand beach a mile in length covered with large cypress. It is but thirty feet wide, backed by interminable marsh. Some rare minute fossil shells were found here. A bay two miles deep is found south of this point, and thence the shore trends south-east. The course from point to point is due east. There are three projecting points from the main marsh of this, the southern end of Lake Okeechobee, covered with a vegetation strikingly different from that of the western and northern shores. It is here that the water filters through the grassy, marshy rim to the south. The low custard apple is the only tree here. Joint grass and lilies are thickly filled in, the whole forming a mass easily permeated by the water. The lake terminates in three great bays, from five to six miles in depth, curving easterly. If there are any streams leading out of them, they are not navigable, or even discernable. Nearly opposite the island before mentioned, Fish-eating Creek comes in, a large creek in some places, but not navigable for our boat. Fort Center, a military post in the last Indian war, was six miles from the lake upon this creek.

After this succession of bays and marshy points the shore suddenly turns northward, and vegetation assumes a different appearance. Cypress appear here and there, and a thick sprinkling of ash and palmetto. About four miles from the commencement of the northward dip the shore turns north-east. Three miles south of this curve is a group of three islands, about two miles in length. They curve from south to north-east, and are nearly submerged, only covered with ash, apparently, and low willows. At this curve in the main shore ends the Everglades, and commences a cypress belt that extends north-east for thirty miles. The beach here is composed of disintegrated shells, and there are many species of salt water shells thrown upon the shore. Fragments of coquina, also were found here. There were tracks of coons and rabbits here, the first seen since leaving the north-west shore. Moecasin snakes were unusually plentiful, and unwound themselves from nearly every fallen tree.

A belt of cypress, in which is mingled all the trees mentioned as occurring in the hammocks of the north-west shore, backs this white shell beach, the only breaks in which, to within two miles of the Kissimmee are, first a deep sound, fifteen miles south-east of the Kissimmee, and a bay two miles from that river. This latter bay so much resembles that of the Kissimmee that it will puzzle one unless he examines it thoroughly.

Taylor's Creek, and another smaller, empties into the lake within ten miles of the Kissimmee, but their channels are so choked with water lettuce and lilies that an experienced eye is required to discern them.

The lake is about forty miles long, by twenty-five in width. In length, the greatest from the mouth of the Kissimmee south east, in breadth, near the centre. It is very shallow and grass shoals extend for miles into the lake. No where did we find a greater depth than twelve feet.

In fish Okeechobee is deficient; such is the violence of the storms there, and such the shallowness of the lake, that it is often stirred to its very centre, and no fish of ordinary mould can survive such a stirring up. The fish-food, also, the crustacea, etc., is scarce. Alligators are not so numerous as one would expect, except in the lagoons and at the creek-mouths. Birds are not abundant, with exception of the fish hawk, crying birds, snake bird and heron. A complete list of the birds will be sent for next number.

During all our voyage we saw but one man beside our party, and the only evidence of any people ever having lived here was in the discovery of the remains of two villages, the houses sunken to the ground, and the plantations overrun with the wild growth of the swamp.

This was upon the east shore, eleven miles east of the Kissimmee River. Bananas, paw-paws, sugar cane and guavas were growing here in wild luxuriance. These villages belonged to a portion of the Okeechobee tribe of Seminoles, now living in the "Big Cypress," south-west of Lake Okeechobee.

FRED BEVERLY.

A DAY ON THE RACQUETTE—TUPPER LAKE AND BOG RIVER.

WE were stopping at Corey's Lodge, at the foot of the Upper Saranac, during the early part of November last. One morning, the bright sun shining in our window awoke us; it was a pleasure to see its cheerful gleams once more after a two days' rain and snow storm. Scraping some of the frost work from our windows we saw that it was a good day for a hunt, and, although there were one or two ominous clouds in the sky, we were soon dressed, and sitting down to our breakfast of wilderness luxuries. We decided to have a hunt on Racquette River that day, and accordingly we started with guides and hounds across the Indian Carry about eight o'clock.

After an easy walk of a mile we arrived at the Spectacle Ponds, where we took boats, and under the swift strokes of our guides passed rapidly through the ponds and down the winding Stony Creek until we entered the famous Racquette. The starter now went off with the hounds, and we proceeded up the river. I was stationed about a mile above the rest of the party, on a runway by the river bank. My guide had taken the boat down stream to his watch ground, and if I fired he was to come up. All this time the clouds had been getting more ominous, and it soon commenced to snow. I stood the cold as long as I could, and then looked around for materials for a fire; alas, everything was wet from the late storm, and I had expended half my matches trying to start a blaze, when to my joy I saw a dead birch not far off, and with the bark of this I managed to get a fire started. Deer or no deer I must keep warm. I kept my cheerless watch until about three o'clock, when I heard "Old Sport" down below. The snow beat against my ears so that I could not tell how far off he was, but it seemed as if he must be near the others, which proved to be the case, for my uncle's rifle soon cracked upon the air; two more shots followed, when suddenly I heard another hound coming over an adjacent mountain, and telling his sweet story in loud tones. This meant business, and I awaited anxiously the coming of the deer. Nearer and nearer came the hound, but he seemed to be driving the deer to the water farther up stream. I was disappointed, for I feared that he might swim straight across and thus be lost. I eagerly scanned the river, but the snow came down so thickly that I could see but a short distance. Just as I was beginning to give up, I suddenly saw something dark on the face of the water; it approached rapidly, and developed itself into a head with a fine pair of antlers. I stood perfectly rigid, and just as he came opposite me I quickly raised my gun and fired. He gave a tremendous leap, but kept on. I must kill him with my next, or he would be lost. He was making for the opposite shore, and I knew that when he shook the water off would be the best chance. When he reached the shore the noble fellow paused a moment and looked back, as if to see whether pursued or not. That delay was fatal to him. Bang went my left, and after another spring he lay motionless on the water. The swift current carried him off, and I had to wait patiently for help to appear in the boat. Ed., my guide, soon made his appearance, rowing rapidly up; he saw the deer and lifted it into his boat. I was heartily glad to get in, too, and start for home, for I was all wet with the snow and sleet, and my heels ached as if frozen, which proved to be the case. After rowing for awhile we overtook my companion. He had secured a nice buck fawn for his day's work. When the snow had set in I had given up all hope of sport, but our host had a fine pack of hounds, and they distinguished themselves. It was after dark when we reached the lodge, and with dry clothes on we did justice to our bountifully prepared meal, and retired for the night. We awoke the next morning to find it still snowing.

During the fall in the Adirondacks you can only reckon on half the week for hunting; the rest is snow and rain, and sometimes it storms for three or four days in succession, but to our pleasure the next day proved fair, and we broke camp and again crossed the Indian Carry and embarked. We passed rapidly down the beautiful Racquette for about twenty-five miles, each turn of the river developing some new beauty, until in the distance we heard the roar of the waves on Tupper Lake. We had been afraid of this, as there was a very high wind, and when we arrived at the lake we saw that it would be dangerous to navigate. Near by was Moody's forest resort, and as it would not do to go farther with the lake so rough my uncle and I took a stroll off for grouse. We travelled about half a mile from the house, and succeeded in bagging five birds, when we heard the whistle of our guide, and striking a path we followed it back down the mountain to the house. We met Ed., who informed us that the wind had died down, and that it would be after dusk ere we reached the head of the lake, seven miles distant. In fact, it was getting dusky when we started. Our destination was what was formerly Grave's, now the Lake Side House. About eight o'clock we ran up on the shore of the little bay in front of this, and groped our way in the darkness to the house. We retired soon after supper, ordering an early call in the morning.

We embarked about seven o'clock, and proceeded about a mile to the head of the lake. Here the Bog River Falls,

as they pour their waters into the still lake, make a beautiful picture. We carried above the falls, and then proceeded up the river. My guide and I were to go to Round Pond, near Little Tupper Lake; so we proceeded up the branch stream until we came to the three mile carry. With the slush and mud and fallen trees the way was a hard one; but at length, from the top of a hill, the pond lay below us. We had expected to find a boat there belonging to our host, but not a boat did we find. Here was a pretty fix. With a large pond like this a deer had a hundred chances of getting off. To add to our vexation, we heard a hound off to the right. There was nothing to do but to stay on the shore and watch, and as it was very cold we commenced to build a fire. I had but just got a blaze when Ed. rushed up and threw his overcoat over the fire, which immediately put it out. "Don't you see that deer over there," he said. I looked, and there was a head moving across the pond in our direction. It seemed to me, in my excitement, that there was a fine pair of horns on it; but no, it was a doe. To our chagrin, her line brought her out of gunshot; however, just as she was opposite, I fired, making the water boil around her, but at sixty rods my shot gun was of little use.

The point of land she was making for we thought we might possibly reach before she did, so leaping over large trees that were fallen for almost an eighth of a mile, we plunged and rushed desperately on. There was no time to lose, and I rolled on the ground almost dead with my terrible exertions. I saw the deer mount on a high rock near the shore; at the same time Ed. fired. The doe tottered a few steps, then fell to rise no more; Ed. had fixed her flint. We had to leave her until later in the day, when a man came down in the missing boat, which we soon monopolized, and stowed our deer away. We saw nothing the remainder of the day, and leaving the deer in an abandoned hut, to be called for, we returned to the lodge. The next day we decided to return, and with lively strokes we went through Tupper Lake, stopping now and then to knock over some of the many ducks, both black and mallard, that were around us. At evening we arrived back at Corey's, and with another day of hunting, with good success, we decided to return home before the ice of winter closed the lakes, and the snow housed the people of that northern clime.

CHARLES H. CROW.

For Forest and Stream.

PERPLEXITIES AGAIN.

AND next, Oh, Editor! we have the gentle Thaddeus mildly "reaching for" the sealp of a musty old ichthyologist or two, and bemoaning our cherished American habit of giving a thing, particularly an old well-known fish, a new name or a wrong one every time we happen to see it in a new place. But is he not a little wrong, or rather hardly half right when he states that the red and yellow bellied perch with larger mouth than the "sunny" is known in the south as "bream," when nine times in ten he is called the "war-mouth" perch, or simply perch, and when spoken of as bream at all it is always as the yellow bream to distinguish him from the true or blue bream, another larger and better fish?

It is a mystery of the first water how these two fish could ever have been regarded as varieties of the same genus, when really the yellow fellow is a perch of the *perched* type, predatory as a bass and with ventral fins hinged to his skeleton at the shoulders, while the bream, is clearly a carp with ventrals set well aft on his abdomen, is good friends with all the small fry in his neighborhood, wont even turn up his nose at a fly, believes in the "Diet of worms," but is in all other respects a vegetarian.

Like most vegetarians, his endurance is limited and his powers of resistance to the eloquent importunings and constant persuasion of a sharply bowed rod are similar to those of "Rip Van Winkle," when he agrees that "this one don't count," but while the fight does last he can roll more line promiscuously around his own body and all the neighboring stumps, and rush frantically in more different directions all at once than any fish of his ounces that this subscriber has ever tackled. It is true that his ounces are not numerous, rarely more than ten or twelve, but he is very numerous himself in such rivers as the Edisto, Ogeechee and others of similar character. He is of burnished metallic blue color when first taken out, but the lustre rapidly fades as his interest in the proceedings dies out. He is nearly as broad as long, and when his dorsal is removed after broiling, his entire anatomy splits out and he falls into two luscious boneless royal halves. Judging from his tooth-someness, his great fecundity, non-predatory habits and vegetable diet, I should recommend him highly as a valuable food-fish for culture.

While Mr. Norris is thinking up some more hard names to hurl at the ugly head of Lucio-perca, (and he has not mentioned the half of the *aliases* which our ravenous friend uses to obscure his own identity, when laboring to win the confidence of a plump but shy minnow who refuses to come out of the high grass into deep water and be devoured,) I will tell you of how I have "many a time and oft" assisted in taking friend *lucio* in out of the wetness of the Tennessee River in that famous fishing place in the passage of the river through the Cumberland Mountains just below Chattanooga, where the avuncular Samuel of Washington has recently been spending some of his hard-earned dollars in improving or ruining, as the case may be, the navigation or the fishing. The length of the gorge measured on the zig-zag is about twenty miles, height of mountains eleven hun-

dred feet, waterway seven hundred feet, while both above and below the river has an average width of eighteen hundred feet. In the gorge the river is a succession of pools and rapids, and is crowded with masses of rock, and is altogether about as wild and rough a piece of water as one cares to trust himself alone with. During the early part of the war I was in charge of a corps of topographers in that district, and have accompanied many parties on a wild night trip from Chattanooga to Shell Mound, from whence the boats would be returned by rail; each boat would have a fire basket kept full of "lightwood" and a dozen large gourds each with a turpentine fire-ball on a projecting wire from the blossom end, balanced when in the water by leaden rings around the gourd necks and a couple of six foot lines baited with minnows to each.

When two or three boats each, surrounded by its fleet of floating fire-balls, with their long tongues of flame blazing up all over the water, are shooting frantically down the rapids or whirling in the eddies of the big rocks, the waters roaring, all hands yelling like fiends and every one's hair standing on end, the matter really becomes rather absorbing, and the interest don't flag when boats and gourds shoot out into the pool below where the chase begins after such gourds as go zig-zagging around the pool under the strain of the pig pike-perch that are sure to have taken some of the minnows. Then comes the re-saturation of the fire-balls, re-baiting the hooks and getting a good "ready" for another wild rush down the next rapids.

To be sure the proceedings were occasionally varied by such little interruptions as upsets, or controversies with those *chevaliers d'industrie*, the bush-whackers; but as every man was presumed to be able to do his own share either of swimming or controversy, it can truly be said that "our lines were laid in pleasant places." At least they were pleasant to

For Forest and Stream.

HOW TO SHOOT AT LONG RANGE.

NUMBER FOUR.

WE come now to those errors in rifle shooting which arise from *external sources*, and shall first consider those arising from *physical causes*, which make the projectile deviate in its flight high or low, right or left. Difference of temperature will make a difference in the elevation. It has been found by experiment that for each ten degrees rise of Fahrenheit there will be a rise at 1,000 yards of about six inches. This is hardly worth considering, except when referring back to old scores one must make the correction for temperature in the required position of sight. A low barometer also gives low elevation, and a high one the reverse, but how much we cannot say. Wind blowing toward the target will increase the velocity of the ball and lower the elevation. Wind blowing toward the marksman, the reverse. A side wind does the same, but in a less degree. In damp or rainy weather the fouling of grooves is damp and there is less friction and consequently greater velocity than when the grooves are caked with a dry deposit. But if the rifle is wiped clean after each shot, no regard need be paid to this. If, however, the dampness penetrates to the powder there will be a loss of power and higher elevation required.

Wind blowing across the range will of course deflect the ball aside, a light one more than a heavy one and one of slow velocity and slow rotation less than one of high velocity and quick rotation. A good stiff breeze that would deflect a Rigby projectile of 530 grains driven by 85 grains of powder ten feet out of its course at 1,000 yards would deflect a ball of 250 grains driven by 50 grains powder at least thirty feet, so that the unfortunate marksman would probably never be able to get on the target at all. It is of course impossible to lay down any rules or give any tables that will meet the infinite variety of cases caused by winds of different velocities, and blowing at different angles to the line of fire. Even if we could do that, it would be of no use in a gusty day, when the wind is changing its velocity every minute. The only thing we can do is to recommend that poles with streamers be set up at each 100 yards and recommend the rifleman to constantly watch them. We should then move our foresight away from the wind, and not be afraid to move it considerably. Suppose the wind blows from right we move foresight to left and strike to right of bull's eye. Move a little more, and gradually work up to it. The "drift" of the projectile, which is a horizontal deviation in the same direction as the rotation, should perhaps have been mentioned in our last letter, but as its effect is exactly the same as that of a side wind, it was thought better to consider it here.

In the Whitworth rifle the twist of grooves and rotation is from left to right, and with 85 grains Curtis, Harvey's No. 5, and a projectile of 530 grains, the drift at 1,000 yards is 65 inches to the right, requiring a movement of the foresight to the right of 5-100th of an inch. At 500 yards the drift would be about 32 inches; hence the necessity of moving the foresight for each change of distance. The rotation of the earth causes deviation when not firing east or west, but not enough to be taken into account.

We come now to *optical illusions*, which make the marksman think he is aiming at the target when he is not, and which perplex him more than all the rest put together at long ranges. The most obvious one is when the sun shines from one side or the other of the rifleman, say from the right, and lights up the right side of the foresight and the left side of the notch of the rear sight, making him shoot to the left. This is obviated by blackening the sights,

and prevented altogether by the covered globe fore sight and aperture rear sight. Refraction or mirage is one of the most common sources of error. There are several kinds. One is where objects are magnified vertically and seem taller than they really are, or what sailors call "looming." We aim at the image of the target instead of itself and our balls pass over the top of it. Hence we require to lower our sight. This generally occurs on very hot sunny days. There is another kind of mirage when the air has both vertical and lateral refraction, and objects are actually magnified as if seen through a telescope. In this case the reverse takes place, and when we think we are aiming at an object we are really aiming below it, and our balls ricochet unless we raise the sights. This takes place on those extraordinarily clear days when we see distant objects with great distinctness. On such days our rear sight requires extra elevation. Sudden changes of light, such as take place on days when clouds are drifting rapidly across the sun, require corresponding changes of elevation.

Captain Heaton, in his "Hints to Rifleman," says that if shooting on a dull day, the sun lights up the sights, leaving the target dull, *more* elevation will be required, but if he lights up the target while the rifle is in shade, *less* elevation. If shooting on a clear bright day, with sun shining on target, if he disappears, *more* elevation; but if the target be shaded and the sights lit up, and the sun suddenly disappears, *less* elevation. At 500 yards Captain Heaton thinks this would make a difference of two feet.

Any person who wishes to experiment upon this interesting subject can do so if they have from their house an extended view, by fixing their rifle on a rest and sighting it at some distant object like the top of a steeple. As the rifle does not move, the object will appear to rise or fall.

T. C. C.

HOW OUR GERMAN FRIENDS SHOOT.

From A. Von Lehman, Esq., of Philadelphia, we have received the following interesting letter, describing fully the methods used by German marksmen at their rifle contests. As we are frequently asked to reply to questions having to do with *Shutzen-Vereins*, Mr. Von Lehman's letter will be found giving exactly the information required. It may be quoted as authority, the writer being the editor of the *Shutzen Zeitung*, the official organ of the Philadelphia German riflemen.

PHILADELPHIA, April 13, 1874.

EDITOR FOREST AND STREAM:—

Our manner of scoring is different from yours. Our range is 600 feet, ring targets, divided in 25 rings (circles), 22-25 forming the black (centre) and 21 the white, 1 the lowest, 25 the highest number to each shot. During the summer we have regular practice every Thursday, when matches of three shots are made at the ring targets. Scores of 60 win a silver medal, scores of 70 a gold medal, each to be won once a year and to become the property of the winners. Last year one gold medal was won and 15 silver medals. Bull's eye targets have 12 black, with a four black bull's eye; the regular practice is pool-shooting, at which only the numbers of bull's eyes count, and the money paid in is distributed proportionately. At match shooting the bull's eyes are measured, *i. e.* from the centre of the bull's eye to the centre of the bullet hole, the former being marked 0 deg. and the gauge marking 100 deg. to 1 sec. For best shots, that is, lowest figures of degrees we award prizes, while for highest numbers of bull's eyes premiums in money are given. Besides the ring and bull's eye targets, we use the man-target. This represents the upper portion of a man's body, divided in either 10 points, *i. e.* square sections with premiums corresponding to the more or less deadly effect which a shot in the corresponding section of a man's body would have, or in 19 vertical sections, the middle one counting 10, the extreme left or right 1 point. Sometimes we also use field-targets (German and Swiss model) of which the black is an oval 10x20, divided in three vertical fields the middle one counting 2 points, the side field 1 point. During the winter we have twice every week practice with parlor rifles (air rifles) at 45 min. range, targets 8 con. diameter, with 8 5 min. rings, rings 7 and 8 black. These are either stationary or pendulum (swinging) targets on a disk 14 in. diameter. There are generally, during the winter, 3 competitions for prizes given by the club. For these we use as targets colored prints 9 in. 11 sec. diameter disks, on which is marked in pencil a small four ring target, 2.50 con. diameter not visible from the stand nor exactly congruent with the centre of the disk, but, therefore, open to inspection before shooting. On the pendulum a small prize is won every night when that target is used, the winner to give a prize for the next shooting evening. Besides, members give their likenesses to be shot for and to be presented to the club by the winners. In this way our meeting-room is really ornamented with likenesses, as altogether our hall, property of the club is generally called a self-appointed concern by visitors from abroad.

The above will give you an idea of our system, and I may only add that we have no badges which change hands from year to year, while they remain the property of the association for all time. Rifles of any kind are admitted, provided they carry not less than 28 (round) balls to the pound; no rest or telescopic arrangement allowed.

A. VON LEHMAN.

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

—We are very glad to be able to print the following peremptory denial to the statement of our Albany correspondent that Seth Green has ever stocked or favored the stocking of the waters of the North Woods with pickerel. We have seen this statement several times repeated and never denied, and while we regret that our columns should have seemed to aid in doing an injustice to this eminent pisciculturist, we are rather pleased to bear the blame, that we may be the means of squelching the erroneous statement and setting him right before the public:—

ROCHESTER, April 11th, 1874.

MR. HALLOCK, Dear Sir:—I see in FOREST AND STREAM of April 9th that an Albany correspondent says "all the sportsmen are very bitter against Seth Green for favoring the stocking of these lakes with pickerel, as they say it will strip them entirely of what few trout there is left." I never have put a fish known to be the pickerel in any waters of this or any other State, nor have ever recommended them to be put in any waters. Yours, SETH GREEN.

In addition to this disclaimer of Mr. Green's, we have a note from a friend at Keeseville, New York, explaining the origin of the mischief done to the Adirondack waters by introducing pickerel into them, the guilty one being a Long Lake guide without shame or principle. Hereafter we shall not assume the responsibility of printing anything of a personal nature without appending the real name of the writer. In the instance above noted we know that no malice was intended, the writer merely repeating the gossip of certain Albany anglers.

—Messrs. Richardson Brothers, the fish culturists of Big Springs, Wisconsin, have invented a can for transporting live fish which differs somewhat from others in its construction. It is made of galvanized iron. About one fourth of the way down from the top is a pan made of the same material, and perforated with holes large enough to allow water to pass through freely. The pan rests on props riveted to the side of the can, and can be lifted out at any time. This supports a small tin pump, which reaches from the bottom of the can to a height sufficient to allow of a small piece of ice being placed under the nozzle and on the pan. A tight fitting cover, also provided with holes for the admission of air, when not working the pump, and some strong handles, make the can complete. By occasionally working the pump the water is kept well aerated, and cooled by falling on the ice and through the pan.

MARYLAND FISHERY COMMISSION.

BALTIMORE, April 4th, 1874.

EDITOR FOREST AND STREAM:—

The Fisheries Bill, published in your columns recently, has passed the legislature at Annapolis, and under its provisions T. B. Ferguson, of Baltimore, and Philip M. Downs, of Caroline county, have been appointed commissioners by Governor Groome. They will at once enter upon their duties, one taking the Chesapeake and the Eastern Shore, and the other the Western Shore, with its larger rivers. Important questions of inter-State rights and comities will have to be settled with Virginia as regards the Potomac, and with Pennsylvania as to the Susquehanna. You may take it both literally and in its usual metaphysical sense when I say that the commissioners will have to begin *ab ovo*. As yet, Maryland has made no attempt to preserve and protect her fisheries by a general law, although the waters of the State are pretty well shingled over by special petty acts. Messrs. Ferguson and Downs will undoubtedly be obliged to the commissioners of other States for information and assistance, and they will also have the valuable aid of Professor Baird. The appropriation is only of \$3,500, "to be paid out of any moneys not otherwise appropriated." Not to speak of this amount as inadequate for building a hatching house, and all the expenses of a beginning in fish culture, there may be some difficulty in finding a dollar in the treasury unappropriated. The legislature has made a very clean sweep of it for some time to come in carrying on the State government. Probably the commissioners will find a way over this obstruction, and be enabled to utilize the immense water area (five eighths of the whole State) of Maryland. With a happy appropriateness it has been found that terrapins, perhaps crabs, and certainly oysters, are capable of artificial increase, and if in the future there should be any fear of the failure of these objects of pride and glory here it is a matter of satisfaction and comfort that they can be turned over to the solicitous care and nursing of these responsible persons. At present they will have their hands full with the Potomac and Susquehanna shad and herring, the trout and the black bass.

C. C.

—There are at present 80,000 lake trout at the State hatching house at Marietta, Pennsylvania. These will be immediately distributed throughout the streams of the State. There were also in the same establishment 150,000 California salmon, which have been turned into the streams. One hundred and fifty thousand Kennebec salmon are in process of hatching, and as soon as of fitting size will be similarly disposed of. The commissioners report 2,700,000 as the product of the young shad hatching at Marietta last year. This indicates that these officers have not been idle, and that if they are successful in their application to the legislature for additional appropriations they will in the course of a few years accomplish a work that will add millions to the value of the State's products.

—The Richmond State Journal says:—"The Assembly joint resolution in reference to the improvement of the falls of the Potomac, so as to facilitate the passage of fish, is intended to give some Virginia moral support to the effort now being made in Congress to have that body authorize the fabrication of some sort of a contrivance that will allow the ascent of fish to the waters of the Shenandoah River and upper tributaries of the Potomac."

—This is the first stanza of a touching song recently set to music, and we have room but for the one, the remaining half dozen running in the same solemn vein:—

Oh! bury Bartholomew out in the woods,
In a beautiful hole in the ground,
Where the bumble bees buzz and the woodpeckers sing
And the straddle bugs tumble around.
So that, in winter, when the snows and the slush
Have covered his last little bed,
His brother Artemus can go out with Jane
And visit the place with his sled.

—We are requested by the Saratoga Rowing Association to print the following card:

SARATOGA ROWING ASSOCIATION.

It is necessary for the Saratoga Rowing Association to have the address of every amateur rowing club of good standing in the United States and Canada. The Association propose to issue soon its circulars concerning its annual regatta, which will be given some time in August. Therefore it is to be hoped that all rowing clubs will send their address, giving name of President and Secretary, so that none may be overlooked, nor fail to receive circulars. Address

SARATOGA ROWING ASSOCIATION,

For Forest and Stream.

A DESIRE.

(FROM THE GERMAN OF HEINE.)

THOU art so like a flow'ret,
As pure and fair and wise,
I look on thee, and longing
Does in my heart arise.

So lay my hands in blessing
Upon thy sunny hair;
Praying that God might keep thee
As pure and wise and fair.

E. C. G.

THE VIOLET.

(FROM THE GERMAN.)

"SAY, violet, sweet violet,
Why dost so soon appear?
When all the flowers are sleeping yet,
Thy head why early rear?"

"Because I am both fresh and new,
It will not signify!
Say, if I came when roses blew
Would all not pass me by?"

E. C. G.

For Forest and Stream.

A TAPIR HUNT IN COSTA RICA.

SOME ten months ago the fortunes of the writer were cast with those of an exploring expedition into a portion of Costa Rica hitherto very slightly known. The exploration of the country was not as much the object of the expedition as the re-discovery of some long disused and neglected gold mines reputed to be in the possession of the Indians of the interior. Of course we were fully determined, however, not to neglect so favorable an opportunity for collecting specimens of the fauna and ornithology of the country.

Our party consisted of Professor G—, well known for his long connection with the coast survey of California, and whose services as leader and organizer of the expedition had been enlisted in the indirect interest of the Costa Rica Railroad Company; myself, a vagabond artist whose evil star had left him stranded in Port Lemon without the traditional *sou-marguer*; Brown, a Jamaica negro, who had served in one of the West Indian Regiments in several African campaigns, and who condescended to forget his exalted station in so far as to act as cook; José Leon, a Spanish mulatto from Cartagena, who acted as hunter; and four Indian boatmen. This party was afterwards considerably increased, but at the period of which I speak we were not "seven," but eight.

It was while ascending the Sic-Saula River (a large and rapid stream which empties itself into the sea some 100 miles south of Georgetown), on our way to the residence of the king of the Blanco tribe, that the episode which I am about to relate occurred, the exciting nature of which will be better understood when I mention that the animal on whose capture we were bent was of so rare a species that even the Indians are in many cases ignorant of its existence. It was at the end of a long day's journey, Antonio and Chanquoi were busy putting up a ranche under the lazy supervision of Tu-cus, who was unpacking our rifles from the waterproofs in which we had wrapped them during a shower that had fallen some time before; Brown cutting ham for our supper and keeping up a grumbling accompaniment at being obliged to work in his wet clothes, and the professor and myself in that airy costume peculiar to Venuses and new born babies, changing our water-soaked trousers and shirts for dry ones.

We were camped on a flat, sparsely covered with cana brava and wild plantain trees. The great globe in its ceaseless whirl had just carried us beyond the direct gaze of the sun, but a ruddy afterglow still lingered on the peaks of the distant Cordilleras, lending faint coloring to a picture rapidly fading into the sombre tints of night, and to which the rising mist from the river added a weird and ghostly character. Our canoe, secured to a stake by a strong painter, lay well beyond the reach of the mighty current which, already swollen, for the rainy season was fast setting in, swept by with a ceaseless murmur. I was just falling into a favorite train of thought, suggested by the apparent waste of these great powers of Nature, and which leads me irresistibly to the conclusion that mighty purposes, in which man can have but an unimportant share, remain to be worked out on this earth, which, with a childish presumption, we are so fond of designating as ours, when a shout from among the canes startled us all into instant attention. Recognizing the voice as that of José Leon, who, while engaged in collecting wood for Brown's fire, had wandered away unnoticed, the professor and myself hurriedly joined the hunter, as it was evident from his gestures that he had discovered something worthy of attention. "Tis a *vaca monte*, señores," he cried, in answer to our inquiring looks, "and if I do not much mistake, one of the large sort with the red hair; they are so rare that we hardly ever come across them now. See where he has climbed the bluff; look at the length of his reach; why, he must be as big as a cow." Sure enough, the red sandstone of the hill side bore the marks of the tapir's great clumsy feet. The animal had evidently come down to the water to drink, and the return trail, showing that he had not crossed the river, led us to infer that he had a haunt in the neighborhood.

"We must not miss such a chance," cried the professor, in ecstasy; "if we lie in ambush here all night we will be certain to get a shot at him when he comes again to the water; run José and fetch both rifles; we will get into position at once." "Stop a minute," cried I, "the professor's rifle will be quite enough to bring. I am so tired I would not

stay up to-night to shoot a white elephant." "A white elephant," cried the professor, in disgust, "but this is a red tapir! You might live to the age of Methuselah without getting another such chance." "Well," I retorted, "I don't think I shall live even through the night without some supper; that I must have, and I strongly advise you to follow my example."

Such a trifling consideration would never have prevailed on the enthusiastic professor but for José Leon's assurance that there was not the remotest chance of the tapir's making his appearance for some hours to come; and it was with as much irresolution as Mr. Pickwick displayed when he parted from old Humphrey without shaking hands with him for the third time, that the professor at length forced himself from the scene of his anticipated triumph.

Munching our fried ham and hard tack with that glorious appetite which an active, open air life insures, and for which epicures, could they procure it for money, would be wise to part with half their possessions, we held an exciting council of war. The professor's enthusiasm, fully participated in by José Leon, was, under the genial influence of food and drink, gradually extending itself to me, and having bargained for one smoke, which the professor reluctantly allowed, fearing lest the tapir's olfactory nerves might detect the unaccustomed odor, I finally determined to participate in the midnight vigil, a lively remembrance of former disappointments in similar exploits rendering me, however, somewhat less sanguine than my more impressionable companions.

The professor, abundant in his precautions, had been gradually diminishing the bulk of the fire, and now that the Indians had finished their supper, finally reduced it to a couple of smouldering logs, sufficient to afford means of relighting the pile, but not bright enough to shine through the intervening canes and prevent Mr. Tapir from indulging in his accustomed matutinal refreshment. Having filled our pockets with several extra charges, we noiselessly stole to the positions assigned us by José Leon, and now began that sensation, half ecstasy, half agony, which sometimes makes the young sportsman feel as if he would gladly see the enemy of mankind himself appear within range in order to afford him an excuse for letting off his piece and putting an end to the period of suspense. Talk of the devil—the thought had hardly flashed across my mind when down the bank rushed a horrible winged figure, with flaming eyes, and hoofs and horns complete. I raised my rifle convulsively, but the hammer flew up and struck me so violent a blow on the nose that I was utterly confused for the time, and with difficulty comprehended the meaning of the words, uttered in a despairing tone, "Confound it, man, you're snoring loud enough to frighten all the beasts out of the forest." Surely enough, I found I had fallen peacefully into the embraces of the drowsy god, and, having turned over on my back, would in all probability have slept till morning had not a well directed pebble, jerked by the professor, alighted on my nasal organ, and instantly called into existence the startling train of fancies above narrated. Thoroughly ashamed of my unsportsmanlike behavior, I shook off with a painful effort the almost irrepressible desire to shut my eyes once more, and now, in deed, began a period of waiting which taxed all my endurance. The night, which was very dark, had also become unpleasantly chilly, and, to use a thoroughly Irish expression, that almost audible silence prevailed which, after a time, becomes so distressing to irritable nerves. The only sounds which broke the stillness being the occasional ha-ha of a loon on the river, or an uneasy movement on the part of the professor, José Leon lying as motionless as a cat at a mouse hole. How long this lasted I am utterly unable to tell, for I felt as powerless to compute the passage of time as any opium eater in his most distorted dream. At length, however, a faint "hist" from José Leon roused my attention, and in a moment more a rustling in the bushes caught my expectant ear. The noise increased, and before long a dark object appeared, shuffling down the bluff within twenty or thirty feet from where we lay. To me it appeared nothing more than a black mass on a scarcely lighter background, but to Leon's practised eye, however, the tapir's form was plainly distinguishable, and the sharp crack of his rifle rang through the silence of the night. The professor and I poured in a broadside, and springing to our feet, were hardly able in our excitement to obey an elementary rule in hunting big game, viz., to reload the instant you deliver your shot. A hideous grunting and splashing in the shallow water convinced us that our quarry had not escaped unscathed, and the arrival of a couple of the Indians carrying firebrands, which they fanned into flame as they ran, enabled us to distinguish a huge bulk struggling convulsively within a few feet of the shore. We at once poured in another volley, but so thick was the hide of the brute that it required two more shots at the same close range before he consented to stretch out his limbs and die, as the Irishman said of his pig, for all the world like a christian. We soon drew our prize to the shore, and found that Leon's surmise was a correct one; we had indeed shot a red tapir. It was a male, and fully five feet in length from the tip of its short tail to that of its ugly, overhanging snout; its hide, covered with the distinguishing red hair, we soon found to be fully an inch in thickness; and in its general outline it bore a striking resemblance to the form of a pig passing by process of evolution into that of an elephant. Dawn found us hard at work preparing the body, fatigue being for the time forgotten. When, however, the skin was ready for hanging in the sun, and we had made a hearty breakfast from some savory steaks cut from the fallen monster, which, although

they would probably take rank at home with a particularly inferior beefsteak, tasted to us, after our saltmeat diet, like the choicest porterhouse cooked in Delmonico's best style, exhausted Nature asserted her rights with irresistible power, and determining to remain camped where we were until the following day, we took shelter in the ranche, and soon were wrapped in delicious slumber. Before very long, however, we were again roused by the indefatigable Leon, who came with the intelligence that another tapir had been discovered, and in an instant all was excitement again. The Indians loaded their long guns with slugs enough to shoot half the game in the forest, and we, buckling on knife and revolvers, and seizing our rifles, started in Indian file after Leon, who, leading us up by the bluff, at the foot of which lay the remains of our last night's victim, and for some half a mile along the line of the river, pointed out a growth of broad leaved, wild plantains, among which he declared lay hidden a female tapir, probably the mate of the one we had shot, accompanied by her calf. We were quickly posted in a circular line between the plantains and the river, and Chanquoi, making a long circuit, got on the other side of the covert and began beating the game towards us. We had not long to wait; first came a crashing amid the brush, and then, lumbering into full sight, with her calf beside her, appeared the huge misshapen beast we were in search of, making directly for the tree behind which I stood. I raised my rifle, and, shall I confess it, a peculiar sensation, which, whatever it may have been (Pure funk; printer's devil), was certainly not conducive to accurate shooting, prevents my being able to state exactly at what part of the brute I took aim. The next instant I had made way for her ladyship with remarkable celerity, and she, with a lack of civility I was perfectly able to excuse, passed on towards the river without even noticing me by a glance. Bless me, why did you let her escape? roared the professor. Bless her, replied I, I am extremely obliged to her for letting me escape. Come on, cried Leon, we may get a shot at her yet, and off started the whole party in pursuit, each individual Indian yelling at the top of his voice. The speed at which the animals went, considering their lumbering build and the thickness of the undergrowth, was something wonderful. It was useless attempting to perforate their thick hides from behind, and our only chance was to turn them before they got to the river. On we plunged, reckless of torn clothing and lacerated skins. Soon the forest grew lighter, and the glimmer of water warned us of our approach to the river bank. The wild enthusiasm of the chase, however, rendered us reckless, and on we sped, till suddenly the game disappeared from view, and the next instant our whole party were struggling together in the mud at the bottom of a steep bluff, while the two heads of mother and child were rapidly lessening in size across the expanse of the turbid waters of the river. The professor, his face covered with mud, cast a reproachful glance at me, his resemblance to a super I once remarked behind the scenes, painted up for some Indian drama, and trying to look spooney at a girl he was talking to, struck me so forcibly that in an instant we were both roaring with laughter. The whole party joined in our merriment except Leon, who looked on scornfully, evidently quite unable to see where the joke came in. We retraced our steps to camp, and after repairing damages sought once more our much needed repose, while in the sun before the ranche hung drying the skin of the only red tapir ever killed by an American in Costa Rica.

How to Cook a Wild Duck.—How neatly a Frenchman turns a compliment, makes a *calambourg*, or gives a receipt for cooking. Here is a way of preparing wild ducks, told with exceeding grace, which method we have no doubt is as good to eat, as it is pleasantly narrated, taken from *La Chasse Illustrée*.

"Once on a time there was a terrible wild man who lived on nothing but what he shot or fished. This wild man possessed all the virtues which belong to a free life in the woods, but besides was remarkable for two things, his culinary talents and his indecision. He was so undecided, that he never was quite sure what kind of sauce he would dress his game with. Once it happened to this eccentric man when he had shot a hare, that he cut it all up into fine bits, in order to make a stew, when suddenly changing his mind, he sewed together all the disjointed members of the hare, and made roast of it. Never was there seen so perfect a gourmand, nor one so utterly undecided. It came to pass that on one occasion a gentleman, a hunter and a gourmand too, stumbled across this wild man in his lair. With the hospitality of a savage, the wild man invited the new comer to dine with him, on a magnificent wild duck, which he proposed roasting. It was a lovely sight to see how the noble bird, turning slowly before the fire, was just assuming a delicate golden tint. "Looks nicely, does it not?" said the savage, "but I shan't roast it." In vain did the guest plead for roast duck. Remorselessly the savage tore the bird from the spit, cut off legs, wings, divided up the breast, and pitched all pell mell into a stew pot. Sad, even despairing, the hungry guest, a remonstrance on his lips, saw the wild creature throw into the pot a pinch of salt, then a few whole pepper-corns, two table spoon-fuls of olive oil, then a half tumbler of Bordeaux wine, and last the juice of a lemon. Then the untamed man stirred it and let it simmer for a half hour. Somewhat doubtfully the guest tasted the dish. Oh! ecstasy, it was delicious! Full of enthusiasm, that worthy man has sent us the receipt."

Will some of the readers of the FOREST AND STREAM try M. Florian Pharaon's receipt for cooking a wild duck a *Pindéris*? The great Brillat Savarin could not have told how to do it more artistically.

—After the late champion match, Daly offered to play Garnier the same game for \$500 a side, but Garnier would not accept. The offer is still open.

Woodland, Lawn and Garden.

FORM OF CITY GARDENS—PLANTS FOR EFFECT—THE CIRCLE.

THE arrangement of a city garden must always depend more or less for the beauty of the same on its limited size. Every one well understands the possibilities and impossibilities of the effects obtained. In a limited space, as found in most city gardens, we have but little room in which to make what so many of our lady friends so much delight in—a "city flower garden." We will, however, give them the benefit of our practical experience in the laying out or arrangement of city gardens within a small space. And herein will be found the principal obstacle to a good show of flowers, viz., too small a space for the development of choice flowers. Therefore, we shall in this case only give such instructions as shall be best adapted to small plats in front or rear of the dwellings found upon the majority of New York or any other city streets.

We prefer always to see—especially in cities—for a garden finish a well laid green sod or swarded lawn, be it eight by ten feet or five times that dimension. Green, closely trimmed lawn, large or small, is always a pleasing and refreshing feature for the eye to rest upon. We know very well that many will say "that is too severe in taste, etc.; we must have some flowers; do give us a few." All we can do to gratify your wishes we will assuredly do, and if our suggestions shall in any way aid the inexperienced in their work we shall not have written in vain. But we candidly assert we would rather improve an acre than two square rods. In front of bay windows should never be massed large trees, particularly if the space is confined to feet instead of rods.

We will suppose you have determined in your own mind to have a flower garden. Then the style is first to be considered. What shall it be? The geometric, the artistic, or the simpler form. We take the simpler for this paper, and you are expected to lay it out entirely yourself. Yes, entirely; do all the work, reap all the honors, and receive all the rewards in the shape of fine boquets of your well merited industry.

We will also suppose your plot of ground to be, say forty feet square, and is now laid down in green sward. If this was my own I think I should be well content to keep it nearly all green, and if I broke the sameness or monotony of this little lawn I should prepare a circular bed by striking a circle of ten feet in diameter in the immediate centre of this plat. You will please notice the manner by which I obtain my circle, and then, as I shall give you practical working instructions, and not plans, you can readily make just as correct an outline as myself. Remember, what you learn here embodies the very first correct principles of the art of laying out larger or smaller grounds. Commencing with the simplest of all forms, without any pretensions to elaborateness, we will show you a pleasant form of garden, intended for the display of annuals and bedding plants, and which can also be adapted to plants of another class, color, and habit.

In order to obtain a correct circle of ten feet in diameter, you will first procure a pole for your measuring rod, say three inches wide by six feet in length. This may be marked off into feet, and divided and numbered from one to five, like an ordinary ten foot measuring rod. Near one end of this pole you will bore an inch hole, and into this hole you will have to fit a smooth pin of eighteen inches in length, sharpened at one end. At the figure five on this rod or pole you will have another hole of the same size as your first. Into this hole you will insert another pin, of either wood or iron, which has a very sharp point; this pin should enter the hole quite firmly, and with it you work out the outline of your circular garden. You will first fix your rod upon the ground and drive the pin near the end firmly into the ground; then you will attach the pin at figure five, and you have a half diameter of your circle in your adjusted rod. Now carefully draw your complete circle, which will be of ten feet in diameter on the green sward. You now have your outline perfected, and removing your rod you will cut through the sod to a depth sufficient to remove the same entirely from the enclosed circle, leaving the smoothly cut edges clean and true. No particular instructions are necessary here in regard to the preparation of the soil for the flower garden, as they have already been given in other papers relating to the same—a good, deep, rich, finely pulverized soil always constituting the basis of a flower garden.

The centre of this bed may be planted with any tall plants you may choose, such as zinnias, astors, marigolds, balsams, heliotropes, or two or three cannas and a calladium or two. Next to these you can place a row or continued circle of bedding plants, say phloxes, portulacae, Chinese pinks, and the low pinks of various kinds obtained of the florist. In the row next the edge of the circle you can place the zonole geraniums, and in the row next to them the silver leaved geraniums. This will give you a fine show at a very trifling expense. We should say here that the bed should be raised one foot in the centre.

I do not deem it necessary to name for these circles all the plants, but rather let your own taste assist your selection. One of the finest beds of this style I have ever seen had for its centre three calladiums, two calla lilies, and two Indian shot, or cannas. The rest of the bed was filled entirely with silver leaved geraniums.

Thus we have given you in this paper one of the plainest of the simple forms of city gardens, and one from which, as your confidence in your own ability increases, you can elaborate and extend into many beautiful forms of fine and unique design.

OLLIPOD QUILL.

SPRING RADISHES.—The great charm of a good radish is in its mildness, and this can only be secured by growing it in a rich soil. For a spring radish, indeed, the soil can scarcely be too rich. This hurries it up. A slow grown radish is sure to be hot and stringy. The round radishes, or turnip rooted, are the best, and the white generally more acceptable than the red. The long rooted radishes sometimes are in eating a little earlier, but to most tastes are not so grateful as the others.

In sowing radishes a common error is to put the seeds in too thick. It is thought that they can be weeded if they all grow, but they are seldom thinned out, and when left thick are never so good in quality, besides being later in coming into use.

Most people sow thick because they have no faith in the seedsman. It is rarely we have seeds to fail. When they do it is generally through deep planting. Radish seed particularly likes to be kept near the surface. If the seeds are sown while the ground is still moist from the digging and preparing, the seed may be merely sown on the surface and rolled or beaten in. Then every seed will grow, and only those seed may be sown first where a plant is to come up to mature.—*Germantown Telegraph.*

FOREST TREES AND CULTURE.—The *Lincoln* (Neb.) *Leader* gives the results of the system of tree planting inaugurated by the Burlington and Missouri Railway Company along its line for a distance of 120 miles, between Lincoln and Lowell. This latter experiment is of special interest to the farmers of Nebraska and many of the territories, showing, as it does, not only the method pursued in planting, but also the kinds of trees selected, and the percentage of loss in the case of each variety.

The prairie was broken up the year previous to planting, a portion of it as late as the month of November. In the spring the ground was again plowed and made mellow. The trees are planted in a variety of ways, according to their age and condition, but many were laid in a trench made by plowing. The following is a list of the number and variety of forest trees planted:—

Ash, two years.....	20,000
Box elder, two years.....	11,000
Honey locust, one year, set for hedge.....	144,000
Soft maple, one year.....	17,000
Soft maple, two years.....	60,000
European larch, two years.....	72,000
Scotch pines, transplanted and root burned.....	20,000
Norway spruce, transplanted and root burned.....	6,000
Norway spruce, root burned.....	8,000
Cottonwood sprouts.....	28,000
Cottonwood cuttings.....	82,000
White willow cuttings.....	62,000
Total.....	560,000

A subsequent careful examination of the trees gives the following percentage alive and in a thrifty condition:—Ash, 98½; box elder, 92; honey locust, 92; soft maple, 83; European larch, 82½; Scotch pine and Norway pine, each 80; cottonwood cuttings and sprouts, 72; white willow cuttings, 75; giving an average loss of about fifteen per cent., most of which was suffered in the evergreens and cuttings, and may easily be prevented under ordinary circumstances. It will be seen that the lowest percentage of loss was found among the ash trees, amounting to but 1½ per cent. The railway company, on this account, and for the value of the timber, have decided to refill with one or two year old ash trees, and have let the contract to replace the trees that fail to grow and cultivate them next season.

—House plants ought to be stimulated gently once a week. Rain water, so refreshing to summer flowers, always contains ammonia. If you take an ounce of pulverized carbonate ammonia, dissolved in one gallon of water, it will make spring water even more stimulating to your plant than rain water. Keep the soil in the flowers pots loose.

—Minnesota pays a bounty of \$4 an acre for tree culture on the prairies.

Natural History.

QUADRUPEDS OF ARCTIC LANDS—ARTICLE II.

BY ARCHER.

Cervus Alces.—the Elk.

THE elk is another of the cervine race peculiar to the marshy forests of the north. In size it is far superior to the stag, (*Cervus Elaphus*.) but cannot boast of an elegant shape, the head being disproportionately large; the neck short, thick and somewhat maned, and immense horns of from fifty to seventy pounds in weight. These antlers are at first of dagger shape, and then divided into narrow slips; at the age of five years they assume the forms of a triangular blade with tooth-like projections on the outer edge; these increase with age, so that at last the horns have fourteen or more branches proceeding from each expanding portion; an expanse of six feet between tips is not uncommon; another peculiarity is the slouching and heavy upper lip hanging very much over the lower, giving an uncouth appearance. The elk stands five feet high at the shoulders and measures about seven feet from nose to tail; the length of the latter is about one foot. The awkward legs, so long that he may easily step over a fence five feet in height, heavy shoulders, give an awkward clumsy appearance which would not tend to convince the novice that this deer exceeds all others in strength and unites great speed with remarkable powers of endurance.

We owe the first description of this gigantic deer to Julius Cæsar, in whose time it was still an inhabitant of the German forests. But the conqueror of Gaul can hardly have seen it himself, or he would not have ascribed to it a single horn, placed in the middle of the forehead, or said that both sexes are perfectly alike, for the female is smaller and devoid of antlers. At present the elk is still found in the marshy forests of eastern Prussia, Lithuania and Poland, but chiefly resides in the more northern woods of Norway, Sweden, Finland, Russia, and Siberia; in the mountainous districts of the latter it is said to be found of unusual size. The color of the elk is a dark grayish-brown, but much

paler on the legs and beneath the tail; Pallas states that in Siberia, where snow is almost constant, the elk takes upon itself a whitish winter dress, * which observation affords Darwin another link in the adaptation, through time, of color to surroundings. The hair is rough and the hide so hard that it is sometimes difficult to penetrate it with a spherical ball from smooth bore guns.

The elk is naturally a mild and harmless animal, but displays a high degree of courage and even ferocity when rutting or wounded, defending itself with great vigor, not only with its horns, but by striking violently with its fore feet, in the use of which it is particularly dexterous. It has been known to kill the wolf and even man with a single blow of its powerful antlers or a stroke of its foot. They go to rut in the autumn; the female bringing forth in the month of April two fawns—unlike common deer, they are never spotted—which follow the dam a whole year. During the summer they do not, like the reindeer, seek refuge from the gad-flies by wandering to the coasts of the sea, or retreating to the mountains, where it would soon perish for the want of adequate food, but plunges up to the nose into the nearest lake or river, where it finds, moreover, a species of water grass, (*Festuca fluitans*.) which it likes to feed upon. The principal support of the elk is obtained by browsing the boughs of willows, aspens, service trees, and other soft species of woods.

It has been generally stated by naturalists that the moose deer of America and the elk of the Old World are identical, but the fact that, but few, if any of the American quadrupeds have been found precisely similar to their eastern representatives excited doubts which have been finally authenticated. It has been affirmed that when the elk or moose is touched with a lance or pursued, it happens often that he falls down all at once, seemingly unconscious, without being thrown or wounded. From these apparently epileptic convulsions some Hahnemannian disciple, with but a faint idea of *similia similibus curantur*, immediately drew the absurd conclusion that the dried and powdered hoof of the animal was an inevitable cure for epileptiform diseases. Although of such enormous proportions, weighing upwards of twelve hundred pounds, the elk runs with greater speed than would be supposed; his gait is a shambling, shuffling trot; he feeds chiefly by night and ruminates like the ox. The superior length of fore legs and short neck prevents grazing, except against an ascent, for reasons obvious. In the winter they seek the forests of pine in herds for protection from the inclemency of the weather under the shelter of those evergreens. He is generally caught in traps, as he is extremely shy and watchful and finds an easy retreat in the swamps and forests from the hunter. The only time of year when they can be easily chased is in the spring, when the softened snow becomes covered during the night with a thin crust of ice which, while too weak to bear the animal's weight, furnishes sufficient support for the hunter and dogs.

**Novæ species Quadrupedum e Glirivum ordine*.—1778, p. 7.

EGGS AND NEST OF THE YELLOW BIRD.

EDITOR FOREST AND STREAM:—

In the current number (7) of your paper, "C. F. S.," of Troy, N. Y., asks if anyone has seen spotted eggs of the *Chrysomitris tristis*.

I have seen a great many sets of eggs of the yellow bird, both in the field and in cabinets, and I have yet to see a spotted egg of *Chrysomitris tristis*. When the eggs are fresh they are of a uniform pale green or greenish white, but when blown they soon lose their greenish tint and become nearly of a pure white color. Before they become added they are semi-transparent, and have very thin shells compared with those of other finches. The yellow birds have small eggs in proportion to their size, and lay from four to six eggs before incubation commences. Their nests are beautifully constructed, and with the exception of those of our common hummers (*Trochilus colubris*) they are unequalled for their beauty of material and construction. The nest of the yellow bird is generally placed in the fork or crotch of the limb of an apple tree, near a bed of the Canada thistles, the seeds of which forms the bird's principle food during the summer. I do not wish to say the nest of the *Chrysomitris tristis* is always placed in an apple tree, for I have found it in the dwarf willow on the river bank, and in the elm and sycamore, sixty feet from the ground, in an open meadow; but it is more often found in an orchard near the farmer's house than elsewhere. The nest is usually made of the flax-like material which the birds pull from the stalks of dead weeds. It is lined with the down of the Canada and Scotch thistles and is very neatly and prettily made. It is rather large in comparison with the nests of other species of the genus, and it has a very small though deep cavity in which the eggs are deposited. The cow bird's egg is often found in the nest of the yellow bird, but it is four times the size of the latter, and could not be easily mistaken. The *Chrysomitris tristis* breeds very late in the season, and seldom builds its nest before the latter part of June or the fore part of July. The fact of Wilson's mistake on the eggs of the yellow bird has been killed several times; but I see it will bear killing again. Some persons think Wilson and Audubon never could have made a mistake, but both made many blunders, particularly Audubon.

JOS. H. BARRY.

THE STOCKING OF OUR EASTERN BARRENS WITH PINNATED GROUSE.

EDITOR FOREST AND STREAM:—

I wrote you, not long since, and urged through your columns an attempt to restock our Pennsylvania and New Jersey barrens with the pinnated grouse. We could hardly call such an enterprise an experiment; it would be a success beyond a doubt, and to illustrate, I would mention that I have it from authority that Dr. F. Jenkins Purnell, of Berlin, Worcester County, Md., about five years ago obtained two pair of grouse from the West, and let them out in the vicinity of Snow Hill, Md. The first season after having been liberated they bred and raised twelve or thirteen young, and from these it is now estimated that there are in this section of the country about two thousand prairie chickens.

The people in the vicinity became interested in the matter, and agreed to protect them. A law was passed prohibiting their being killed for five years under a heavy penalty, and consequently the birds have greatly increased.

The country in Worcester County, Md., is very similar to the scrub sections of southern and eastern New Jersey. Pinnated grouse can be bought at a very low figure during the winter in the western States, and if cooped in low padded boxes in pairs, safe transportation could be relied upon. I feel confident our New York and New Jersey clubs would

heartily join Pennsylvania in such a movement, and would influence in their States the passing of a proper protective law.

If, from "the planting" of two pair of pinnated grouse, Dr. F. Jenkins Purnell has given his county nearly two thousand in five years, what sport could be relied upon if our associations would bring even one hundred pair from the west? "Homo."

—Another correspondent wishes to express an opinion on the quail question, whether they can withhold their scent. If any other person thinks they can, let him not withhold assent.—ED.

CINCINNATI, Ohio, March 31, 1874.

EDITOR FOREST AND STREAM:—

I think your correspondent "Pioneer" is mistaken in the idea that setting birds emit no scent. In my opinion the scent of a bird is similar to the perspiration of human beings, and scent is, to a certain extent, always given off. Of course a bird setting will not give off so much scent as it will at other times; but it does give off some scent. The reason why Pioneer's dog could not find a quail which was setting, was because there was not enough scent emitted to enable the dog to trace the bird.

W. L.

FORT WAYNE, Ind., March 31, 1874.

EDITOR FOREST AND STREAM:—

While hunting last week in Illinois I killed a large bird of the crane species, which was pure white, with the exception of the edge of its wings, which are black, and top of head, which is brown. It measures 6 feet 1 inch high and 8 feet from tip to tip, and weighed 18 pounds. The secondaries are much elongated and hang over the primaries and tail feathers. The bill is straight and black and black legs. The taxidermist cannot name it. Please name the bird. Very respectfully,

J. T. B.

THE HERON'S TORCH.

SALEM, March 29, 1874.

EDITOR FOREST AND STREAM:—

As substantiating the existence of the "heron's lanterns," I submit to you the following notes taken from "Maynard's Naturalist's Guide." It is the experience of a sister of Mr. M., and a careful observer of nature.

She says: "Three or four years ago I was sitting on the banks of Ipswich River, just at twilight, waiting for my brother to come for me in a boat to convey me home. I was keeping very quiet, when I saw a heron alight within a few feet of me on the edge of the water. He was joined by others, until there were about a dozen; then I observed that every one of them had a luminous spot on its breast. This spot was not very bright, but, as it was quite dark by this time, plainly perceptible. They presented a peculiar appearance as they walked about, and I watched them with interest for some time. This singular light surprised me much, as I had never heard of anything like it before."

The species above referred to is the *Nycteardea gardenii* (Baird), and the season was autumn. I should like to know whether this luminosity occurs on both sexes, and if on nestlings, or developed as the bird approaches maturity. If any of your correspondents can inform me I should be pleased to learn the same through the columns of your paper.

Very truly yours,

R. L. N.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, }
NEW YORK, April 12, 1874.

Animals received at Central Park Menagerie for the week ending April 11, 1874:

One Brazilian Tree Porcupine, *Cercolabes prehensilis*.
One Ocelot, *Felis pardalis*.

One Quail, *Ortyx Virginianus*. Presented by Mr. W. A. Day.

Respectfully,

W. A. CONKLIN.

The Kennel.

ON KENNELING AND FEEDING DOGS.

WE do not think that we can instruct and amuse our readers in a better manner than by giving a portion of a letter from "Old Calabar," a sportsman, in *Bell's Life*. Most of our owners of pointers and setters are aware that the close season for all game birds has arrived, it being a mooted question as to English snipe only, whether it is proper to kill this migratory bird on its flight north in the spring. We would suggest to gentlemen who own dogs, and especially those kept on chain or in the yard in the city, that they would exercise their animals at least once a week, so that these faithful and generally much abused creatures will continue to afford us recreation and amusement without going through a severe course of training and whipping at the beginning of woodcock shooting. Calabar says:—

"Many are the theories on this subject, some good and some bad; but one thing is very evident, that to have a dog in good hard condition, no matter what sort, he must be well kennelled, well fed, and have plenty of regular exercise. Shooting dogs of a known good and fashionable breed are now so valuable, and command such prices, that the greatest care ought to be taken of them; but alas! as a rule, no animal is more carelessly looked after—of course I am only speaking of dog owners at large. Most of our well-known exhibitors and breeders pay the greatest attention to their animals, otherwise their chance of taking prizes at exhibitions or winning at field trials would be remote indeed. How often do we see poor unfortunate dogs utterly neglected—a lump of raw meat thrown down to them, no water, their kennels in an utterly filthy condition, no bedding, chained up from week to week, rough and staring in their coats, and eaten up with mange. No animal we have, to keep him in thoroughly good fettle, requires more care and attention than the dog; over feeding is just as bad as under feeding; but this I will touch on in its place. It is not always that gentlemen keeping dogs can command first rate kennels; they may not have the space, their houses may be held on short leases, and they may be unwilling to go to the expense of putting up kennels which they may have to leave behind them the next year. As the rich man can do as he likes it would be useless my giving directions to him as to how kennels ought to be made, because they are buildings you may go to any expense in making. It is to the man of moderate means I address myself, and who may be just as fond of dogs as his richer neighbors. Stables, coach houses, &c., may be made into very good kennels, and will answer the purpose as well as the best, as long as there is a decent sized, well-paved, and well-drained exercise yard. I will suppose you are going to build a kennel to hold three or four brace of setters or pointers; your expenses must be governed by the size and style you are to make your building. The benches for the dogs to lie on should be about a foot from the floor, and fold back against

the wall, so that you may easily wash under them; the benches should be made in *hard* wood, and in *bars*, which must not be too far apart, otherwise the dogs will get their feet through them; half an inch space between the bars is quite sufficient. The object of making the benches in bars is to let the small particles of straw dust and urine through; if the benches are made of hard wood they will not absorb the urine. The walls all round the sleeping house, to about two feet above the benches, should be cemented for the same purpose, the other parts of the walls and the ceiling should be plastered. The flooring, hard bricks, or tiles, must be set and well grouted in cement, and, without any unevenness, merely a slight fall to let the water off. The whole of the inside should be constantly hot lime washed, to keep it clean and sweet, and to destroy all vermin, ticks, &c., &c. This requires to be done oftener in summer than in winter. The exercise yard must be made according to the space you have at your disposal—the larger the better; it must be well and properly paved, tiles of bricks set in cement, and good drainage; if possible have running water through it.

LAVERACK SETTERS.

We published some short time ago a letter from Mr. Laverack of England, in which he stated "that he had never sent or sold a dog or bitch to America." The following letter from Dr. Gautier, of this city, also Mr. Laverack's letter to the Doctor, emphatically states that he (Mr. Laverack) *did* sell a dog of his breed named Ruby to Dr. Gautier. We are at a loss to account for this error on the part of Mr. Laverack, and trust he will correct it over his own signature. In justice to Dr. Gautier and his friends, to whom he has presented several puppies of this breed, we take pleasure in printing the correspondence.

NEW YORK, April 7, 1874.

EDITOR FOREST AND STREAM:—

I was greatly surprised to find in your paper of 19th March a letter from Mr. Laverack, in which he says, "I have never sent or sold a dog or bitch to America."

I enclose the correspondence between Mr. Laverack and myself, including a letter dated Feb. 13, 1872, received from him since my arrival home, in which "Ruby's" pedigree is given. In justice to me will you be kind enough to publish the letter in full, as sufficient answer to his letter?

I met Mr. Laverack at the Crystal Palace Dog Show, London, in May, 1871, afterwards on October 6, 1871, at Moss Fold Farm, near Blackley, 4 miles from Manchester, he coming down from his shooting in Scotland purposely to meet me. I then purchased "Ruby" from him for 25 guineas. His man Taylor delivered her to me in Liverpool a few hours before sailing, and assisted me in getting her on board the steamer. Yours very respectfully,

J. H. GAUTIER.

BROUGHALL COTTAGE, near WHITCHURCH, }
SHROPSHIRE, England. }

DEAR MR. GAUTIER:

Illness has prevented me replying sooner to your letters of December 6, 1871. The pedigree of your red bitch puppy is as follows: She is out of a pure blue Belton bitch named Cora, by a red or chestnut dog named Mystery. Cora is precisely the same way bred as Mr. Garth's, Q. C., Daisy, two years in succession winner of the cup at Shrewsbury Trials. Likewise bred same way as Llewellyn's Countess, winner last year of the Vaynol Trials, getting 95 points out of 100. Cora, Daisy and Countess are out of old Moll, by Dash, the blue dog you saw at the Crystal Palace. Mystery is equally well bred, being out of a blue bitch, own sister to Dash named Duchess, by my celebrated old dog Jet, black white and tan, brother to Fred II. The red bitch you own cannot breed a bad one provided the dog you put to her be pure. She will breed blues or blacks and very likely some lemon and white and some chestnut, all if sire pure, will be good. I am much pleased to hear she has got over the distemper. My address in future is as above, where I shall remain until August, when I go to my shootings in Rooshire, after I again return here. I shall be glad to hear hereafter how the bitch turns out. I am, yours most truly,

E. LAVERACK.

Muzzling Dogs.—An aldermanic act of the city of New York in regard to muzzling dogs has been passed. Just as the necessity exists for having a board of conference, formed of naturalists, whose better acquaintance with such subjects, should influence legislative action in regard to the "close seasons," so should some knowledge of the character and habits of the dog dictate such rules as are thought proper for the protection of life from hydrophobia. Intelligent people are probably satisfied that muzzling a dog in hot weather inflicts a cruel punishment on the dog, and if not exactly prone to bring on an attack of rabies, is not of the least possible use in preventing such an attack. Mr. Bergh has distinctly stated that muzzling dogs "only tends to the creation of the very difficulty which it seeks to prevent." We have before stated, on the best authority, that dogs are no more prone to rabies in August than they are in January. Commending most highly the action of the Society for the Prevention of Cruelty to Animals, we notice that Mr. Bergh has some plans in view for the building of a pound for the vagrant dogs of New York city. The animals are to be collected by the officers of the Society, and are to be registered. If not called for or sold, the animals are to be humanely destroyed. No premiums are to be offered for dogs delivered to the pound, as it would infallibly end in dog hunts all over the country.

YET ANOTHER DOG STORY.—We are not responsible for it. Let M. de Cerilly of *La Chasse Illustrée*, assume all the honors. This is what he tells his French readers. We simply translate for the benefit of our American ones. M. de Cerilly has a friend who owns a dog, a spaniel of the most intelligent kind. This friend is a smoker, and Medor the dog, is sent out every day with exactly five pennies to buy tobacco with. The tobaccoist knows Medor quite well and takes the money, wraps up the tobacco in a twist of paper, and Medor is faithful to his trust. Some time ago Medor with his money in his pocket, or mouth, started on his errand, but loitered on the way, and had a game of romps with a yellow dog who lived round the corner, and between them they lost the money. Medor knowing something was wrong, and that the tobaccoist would give him no credit, sneaked home tobaccoless, and got a good hiding from his master. Next day Medor was sent out once more with five cents for tobacco. Round the corner was the yel-

low dog again, trying to lure poor Medor from the path of virtue. Medor did his best to resist temptation, but alas! he was weak, and fell from grace a second time, and the money was lost. Now being a French dog, some ideas of suicide flashed across his mind, but being a reflective as well as a moral dog after all, though a fearful lieking was in prospective, Medor looked carefully into the situation. A half hour afterwards, Medor marched into his master's presence, the proudest dog imaginable with a double quantity of tobacco, full ten cents worth in his mouth. Of course his master was perfectly satisfied. Next day Medor accompanied by his master went out to walk in the Luxembourg gardens, and approached a group of boys who were playing. "I say sir," said one of the urchins, that is a nice dog you have! We are just going to kill that beast of yours, so we are. He is a thief, and maybe you are no better yourself. Here we were playing at heads and tails when that cur of yours just grabbed up the whole pile of money and was off like a streak of lightning."

"It is with regret," says M. de Cerilly "that I am forced to state in the most positive terms that Medor was a thief. Of course it may be quite in order to insist that the dog in question was endowed with a very superior order of intelligence. I have nothing further to remark, nor do I wish to extenuate Medor's crime."

A HORSE CAR "SPOTTER" DOG.

AMONG the attaches of the Fifth Street Railway Line is one who has exhibited most remarkable fidelity in his attention to the interests of the company. The phenomenon referred to is a medium-sized dog that has been for a long time kept about the car stables, and has of late become a kind of inspector or overseer of the line. Every morning he goes out on a car and rides along for some distance, when he jumps down and waits at the crossing for the next coach. This he boards as it passes, and, after a thorough scrutiny of conductor, driver and horses, and all the appointments of the outfit, he visits some other in like manner. In this way he passes the entire day, usually going over the whole line and inspecting a great many cars. Sometimes he stops at one end of the road and sometimes at the other. He is well acquainted with every conductor and driver in the employ of the company, and is a general favorite. A few days since they all clubbed together and contributed a nickel each for the purpose of buying the sagacious canine a license and a collar. He certainly ought to wear the popular "brass collar," for he is far ahead of all his tribe so far as head goes. At night he keeps vigilant watch at the stables, and seems to have devoted his whole existence to the service of the corporation. He takes his beef with good relish as that he had earned it, and has apparently settled down for life in his position.—*Cincinnati Gazette*.

GUN SHY SETTERS.

CLEVELAND, Ohio, April 2, 1874.

EDITOR FOREST AND STREAM:—

I have a setter that, when young, showed every sign of making a "gun shy" dog. Another pup from the same litter proved perfectly useless, for the same reason. When he was three or four months old and had been pretty thoroughly house-trained, I took him to a boiler shop. He was very shy of the banging noise, but was cured by making him charge under a plate of boiler iron, resting upon some horses, pounding the iron gently at first directly over his head, and making him remain at charge until the noise had no terrors for him. When first shot over he was just shy enough to prevent "breaking shot," but in a short time could have been hunted with a ten-pounder. Am prompted to write the above from nothing your number of April 2d. Also, speaking of white geese, I have seen many large teams of them on the Gulf coast, at the mouth of the Rio Grande River Texas. They appeared to be snow white at a distance, although I never was very near them. This flight was seen by me between April and August.

Duckist.

The Horse and the Course.

THE HERRING SAFE TEAM.

SOME of those quaint old German woodcuts, well known and cherished by collectors, portray the ceremonial, the pomp and pageantry attending the coronation of a Kaiser some 350 years ago. Here the curious may notice huge massive steeds, living mountains of flesh, bone and muscle, bestridden by grim knights in panoplies of steel.

Whenever we see a certain well known team of horses, all champing their bits, the animals with their heads down, their intelligent eyes beaming through a dense forest of foretop, deliberately putting down one clattering hoof after the other, grandly bedecked with bear skin housings, and other equine bravery, we recall to our minds the pictures of those horses the followers of Albrecht Durer once loved to draw and engrave.

There is not a New Yorker who does not know the Herring Safe Team. The most indifferent lounge on Broadway, as this team passes along, must needs look at them, and cannot but help admire the ease with which the magnificent horses draw the ponderous truck and the massive iron safes. These horses strike us as the embodiment of some slow but irresistible power, and we seem pre-disposed to think that although mechanism develops untold forces, did we but hitch this team of eight to a locomotive with valves all open, working under full head of steam, only providing the trace chains did not snap, the animals would haul the snorting, hissing engine along in the way the horses were told to go.

Twelve horses are employed by the Herring Safe establishment, but only eight come under our particular attention. The average weight of seven of the horses is 1550, but the heaviest horse turns the scale at 1750 pounds, making altogether some 12,580 pounds of bone, flesh, and sinew to pull with. Seven of the horses are somewhat over sixteen hands, and the biggest horse is over seventeen hands. The kind of horse wanted for hauling heavy safes is of the

character known as the pony built horse, but of course the term "pony" means only that chunky style of horse where fore and hind legs are close together, with a round barrel, just sufficient to let all the equine machinery work well together. Big horses, if leggy, with too much day light under them, would be useless for the business. The shaft horse must be able to stand no end of shock, and if not steady and well on his legs, would often be thrown off his feet.

The horses come mostly from Pennsylvania and Ohio. Formerly a large proportion came from the first named State, being of the old Conestoga breed, but of late years this fine style of horse is hard to find. Price is no very great consideration with the safe people, and \$800 is frequently paid for a fine animal. Their feed is sixteen quarts of oats a day, with occasional use of soft food in winter. Entire horses were once used in the team, but as at times they were quarrelsome, they are now rarely employed. The most intelligent horse is always put in the lead, and obeys by the word of mouth; "gee" and "wo" are used for the left or right, and at the signal "back" the horses stop. A green horse is generally put somewhere in the middle, and he becomes quickly broken in to the work. In fact, even if he is ugly or awkward, he gets into a school where the other horses soon teach him how to behave, for what can one horse do with four horses before him and three behind him? It has happened that a sensible horse, a little obstreperous at first and ignorant of his duties, after having been thrown off his pins once or twice, suddenly gets the hang of working in the team, and such a horse has in some occasional cases been promoted within a week to take the lead. With a truck weighing 6,700, carrying a ponderous safe of 16,000 pounds through Broadway, turning sharp corners with a well calculated curve, it can be understood how much depends on the strength and intelligence of the animals. Think of the power to be exerted in backing up such a dead weight of iron to the sidewalk, and yet Mr. Herring assured us that he had a shaft horse who had backed up a safe weighing eight tons into position. Of course good, kind and intelligent horses always presuppose a manager or driver having some extraordinary amount of judgment and intelligence, and exactly of this kind we found Mr. Hilliker, who has the horses under his charge. "They keep straight on," said Mr. Hilliker, "and never turn to the right or left until I tell them to. Of course if it happens that they are taking a load up Broadway near their stables, it is in their horse nature to want to go home, but a single word keeps them steady. It is wonderful, though I am used to them, to see how Dan, our lead horse, picks his way along. No skeer or nervousness about him. If there is a team before him going about his gait he will follow straight behind; but if he sees a chance, or it goes too slowly, he will take to the right or left, as his judgment directs. Truck drivers who get tangled up on the streets often say that your horse Dan can make his way through a 'block' in the streets a great deal better than they can! It's quite a trial of temper for our horses sometimes. When the truck gets at the place where the safe has to be put in and hauled up the horses have to stand for hours in the streets, and they get stared at, and patted and touched, and sometimes pinched by the boys, but they don't seem to mind it."

"At what age do you buy your horses?" we asked. "At five or six years' old. We want them fully developed and well broken before we use them. A horse that has been forced too young never will answer our purpose. Mr. Herring can tell you that we had one horse which was twenty-four years' old, and which worked over twelve years' with us. We think when a horse has worked for us six to eight years he has done us full service. We see no difference as to usefulness between the horse and the gelding. There 'sir, now take a look at Dan in the truck, he is our best horse."

Accompanied by Mr. Herring, the senior of the firm, we had a good look at Dan, who was standing motionless in the van. From the sidewalk, such was the compactness of the form of the horse and his symmetry, that his huge size was not perceptible, especially as the street was a foot lower than the pavement, and it tended to diminish the rise of the horse.

"You must mount on the truck and look down on him in order to appreciate him," said Mr. Hilliker, and scrambling up on the seat of the truck we did look down on Dan. Such a huge barrel, such a ponderous rump, such a regular valley, running through the top of the hind quarters, such a massive neck, with the points of two fine ears peering through the shaggy top-knot! It was like appreciating a landscape from some eminence, and not a horse. Mr. Herring loves his big steeds, and by care and good judgment, has collected a team of horses which would be hard to equal in the United States, for size, strength, docility, or condition.

—The Louisiana Jockey Club inaugurated their spring meeting on April 11th. The weather was delightful, the attendance large and the track in fair condition. The first race was one mile and a quarter, for all ages; club purse, \$500; first horse, \$400; second horse, \$100. Ortolan came in first, followed by Sallie Watson, Port Leonard, B. F. Carver, Chris. Doyle, Nellie R., John McDonald, I. O. U., and Falmouth, in the same order. Time—2:17½. The second race, the Pickwick stake, mile heats, for colts and fillies three years old; \$25 entrance, play or pay, with \$1,000 added; second horse to receive \$200, and the third \$100. There were thirty-two nominations and six starters. Bonaventure won. Time—1:51, 1:50½, 1:54. The third race,

distance three miles for all ages with 100 pounds on each; club purse, \$700. The race was won by Silent Friend, beating Bessie Lee, Capt. Hutchinson, Carrington, and Fannie, in the same order. Time—5:49½.

—A trotting match came off at Augusta, Ga., on April 11th, between Hickory Jack and Basil Duke, mile heats, best three in five, to harness, for a purse of \$1,000. Jack Chambers entered Hickory Jack, and James W. Crawford, Basil Duke. The latter won the race in three straight heats. Time—2:41½, 2:35½, 2:39½. A large crowd was in attendance, and about \$6,000 changed hands on the result of the race.

BROOD MARES IN SPRING.—Having for twenty years been a breeder, to some extent, of our noblest domestic animal, the horse, I thought a short article on the care and general management of the brood mare at this season of the year might not be uninteresting. The best feed for the brood mare is corn stalks, or good timothy hay, with four quarts of ground oats and wheat bran, equal parts each day. The ground oats and bran not only enable the dam to make all necessary preparation to supply the coming foal with nourishment at the time when most needed, but it keeps her healthy and strong, and enables her to furnish the growing fetus with the very best kind of material to make the best bone and muscle. The dam should have moderate exercise, but it should be regular. If she is used in a team, she should not be driven faster than a walk, nor loaded too heavy, for in either case there is danger of injuring the dam and ruining the foal. She should be housed or sheltered nights, and in all stormy weather.

As foaling time approaches, she particularly needs the practiced eye of the careful and experienced breeder. For she should be watched by day and night, as many a valuable colt has been lost, that two minutes' labor, at the particular time, would have saved. As soon as the colt is dropped, the attendant should see that its head is free from the blanket, as it will otherwise soon smother or drown. The next thing is to sever the umbilical cord about five inches from the foal, and tie the end next to the young colt with a string, to prevent bleeding; this, if possible, should be done before the dam rises, as many a foal has been ruptured at the navel by the dam rising before the string was severed. After the above has been promptly attended to, leave the dam alone with the foal for half an hour. If, at the end of that time, through weakness or any other cause, the young foal has been unable to secure its natural nourishment from its dam, the attendant with whom the dam is most familiar, should lose no time in rendering the necessary assistance by holding the colt at the side, and by putting the nose to the teats of the dam.

After the colt is able to draw its nourishment from the dam without the aid of the attendant, little need be done, but furnish a shed, if the weather is inclement, and a good liberal supply of hay or stalk, and a peck of ground oats and bran per day until there is a full bite of green spring grass.—*Cor. Michigan Farmer.*

CARE OF TEAM HORSES.—The following good advice to teamsters has been published in the form of a showy poster, and sent out by the Massachusetts Society for the Prevention of Cruelty to Animals. It is signed by Daniel H. Blanchard, and endorsed by several veterinary surgeons, agents of railway and express companies, and by Chas. A. Currier, special agent of the society:—

WHAT CONSTITUTES A GOOD DRIVER.

1. A man who sees that good care is taken of his horse in the stable, by being well fed with wholesome food, of cracked corn, and oats, with plenty of good hay.

Potatoes or carrots may be given once or twice a week to good advantage.

See that he is kept clean, warm and comfortable, with plenty of bedding.

A piece of rock salt should always be left in the manger.

2. He should see that his harness is kept soft and clean, particularly the inside of the collar, which ought always to be smooth, as the perspiration, when dry, causes irritation, and is liable to produce galls on the shoulder.

The collar should fit closely, with space enough at the bottom to admit a man's hand. If too large, it has the bad effect of drawing the shoulders together.

On no consideration should a team, or any work horse be compelled to wear a martingale, as it draws the head down, and prevents him from getting into an easy and natural position.

The cheek-rein may be used, but only tight enough to keep the head in a natural position, and it should never be wound around the hames.

See that the hames are buckled tight enough at the top to bring the draught iron near the centre of the collar. If too low, it not only interferes with the action of the shoulder, but gives the collar an uneven bearing.

Caution should be taken that the girth is not buckled too tight, particularly on string teams, for when the traces are straightened, it has the tendency to draw the girth against the belly, and distress the horse.

3. See that the horse is kept well shod with a good stiff shoe, always calked at toe and heel on the hind feet, as it is there where all the propelling power comes from when heavily loaded.

Keep the feet good and strong, by not allowing them to be cut away too much by the blacksmith.

4. The best of judgment should be used in loading, taking into consideration the condition of the street, and the distance to be traveled.

Never overload, for by so doing, you only distress, strain and discourage your horse, and do him more injury than you can possibly gain by carrying the extra load.

When your load is hard to pull, stop often, and give your horse a chance to breathe.

No good driver will ever resort to the cruel practice of whipping or beating his horse. A light whip may be carried, but there is seldom use for it. Much more can be accomplished by kind treatment and good judgment.

Remember the horse is a very intelligent, proud, sensitive, noble animal, the most useful known to man, and is deserving of the greatest kindness.

—There is a bill before the Massachusetts Legislature defining the close season for trout, land-locked salmon and salmon trout, between the 20th August and the 20th March in each year.

Answers To Correspondents.

We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, traps, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous communications not noticed.

C. E. T., Washington, D. C.—Will reply in our next issue. Too crowded this week.

C. VAN D., New Jersey.—We refer you for the answers to your letters to *Wilkes Spirit of the Times*.

KIRTRIDGE, Ayer.—Will you please inform me what size rifle you consider the best for shooting in Maine? Ans. 45-100.

CARL HODGE, New Haven.—What is the price of Laverack puppies? Ans. \$10 10 s. each, not including transportation, &c.

W. S. J.—We can send you Thoreau's book by mail; cost \$2; think it the best. For fishing, see Hallock's "Fishing Tourist."

G. B. J., Boston, Mass.—What rifle do you think the best to shoot with in California. What is the price of a good one? Ans. If you will look at our advertising columns you will find an ample choice of weapons; calibre, 45-160; price from \$35 to \$60.

DAUPHIN, Harrisburg, Penn.—Please give me the title and price of a good work on fishing. I want a book concerning preparation of lines, flies, bait, knots, &c., and yet not so expensive a work as Norris'. Ans. Roosevelt's Superior Fishing, or Scott's Fishing in American Waters.

H. E.—Please tell me the best medicine for purifying the blood of a terrier dog? Ans. Buttermilk alone is a good but slow alternative in cases of a heated, itching skin, or other cutaneous affections short of actual mange. Nitrate of potash (nitre) is a very useful alternative to dogs, in doses from four grains to ten.

M. M. B., Philadelphia.—What is considered the best American made breech-loading shot gun? Ans. We do not know which is the best. Buy one of each and test them thoroughly. Is the Ward Burton breech-loading shot gun a reliable, hard shooting weapon, and what do they sell for? Ans. We do not know a shot gun with that maker's name; there is the Ward-Burton rifle.

NATTY, Central City, Colorado.—Please tell me if the Remington breech loading shot guns are good guns. I notice the report of their trial in your last issue, but don't know enough about target shooting to learn from that. How do they compare with the shooting of Scott's guns at the gun trial? Ans. Highly creditably and good all round guns.

F. C., Cleveland, Ohio.—Would it be possible to use a glass eye to improve the appearance of a large setter dog that had lost one? Ans. Certainly. Do any of the crack long range shooters take other positions than the standing or kneeling? Ans. Up to 200 yards from the shoulder, standing; over 200 yards, any position; some flat on their backs, others on their stomachs.

G. T. H., Hartford, Conn.—I am anxious to obtain as good a gun as possible for general shooting, such as quail, grouse, woodcock, &c., and one I can use for duck occasionally, perhaps once a year. Will you kindly advise me in this matter as to the weight, length of barrels, stock, gauge, &c.? Ans. The weight should be about 7½ lbs., length of barrels, 28 in., stock depends on length of your arm and neck; gauge, 12 bore. If you can carry a little heavier gun, say 8½ lbs., we should advise you to buy a 10 bore, you would then be able to kill an extra duck or two.

PISCATORALIST, Philadelphia.—Will any ordinary pond do for breeding gold-fish? Where is the best place to get them for breeding? When do they spawn, and how many would you put in a pond 40 feet square? When hatched will they be red or black? Ans. Any pond will do, provided all the catfish and pickerel have been taken out, as they are very destructive to the young fish. Their spawning season is during May and June. Your pond will hold from one to five hundred. Good breeding fish can be had of J. Bagot, 31 Fulton street, N. Y. The color varies, some are red from birth, others do not get so until they are three or four inches long.

F. S. H., Grand Rapids, Mich.—Please inform me in your Answers to Correspondents if there is a work on ichthyology giving full descriptions of the fishes of America, and taking the same place with reference to fish that Gray's Manual of Botany does to plants and Cones' Key does to birds; if not, what is the nearest approach to it? Ans. Do not know of any work that embraces all the fishes of America. There is DeKay's Report on the Fishes of the State of New York, and "Arrangement of the Families of Fishes," by Theodore Gill. Address Naturalists' Agency, Salem, Mass.

ZOOLOGIST, Providence, R. I.—Consult articles in back numbers of FOREST AND STREAM or purchase the "Naturalist's Guide," price \$2. Address Naturalists' Agency, Salem, Mass. Would advise you to take a few small wide-nosed bottles with rubber stoppers, filled with alcohol to put your insects in. Use a small pair of pincers or tweezers for securing the coleoptera and other insects, and a small canze net for butterflies, moths, &c. For preserving bird's skins, use dry arsenic and fill them out with cotton, and make some shallow wooden trays that will fit in a box and rest on each other to keep them in. Take with you a few pieces of canvas or two or three rubber ponchos to throw over provisions, specimens, guns, ammunition, &c., during rainy weather when in camp. For collecting geological specimens, use a heavy hammer with a long handle, a square head and a flattened nose, the edge running at right angles with the handle.

R. B. W.—Will you please answer the following questions: 1st. Are there more than one variety of the dusky duck? About the 1st of October I shot a pair of ducks (on a fresh meadow at the head of tide water) with markings similar to the dusky duck, but only about two-thirds the size, and with bodies larger in proportion to their size than the dusky duck. Unfortunately I did not save the birds, and never have been able to get any information regarding them from the duck shooters. 2d. I have remarked, and have often heard it remarked that the fish hawk (osprey) never increase in numbers in localities; from year to year they occupy the same nests, but their young do not return to build nests. Can you inform me what becomes of them? Ans. 1st. The Gadwall is the dusky duck, and there is but one species. The black ducks and female mallards are sometimes called dusky ducks by gunners. The birds you killed were probably young black ducks. 2d. The osprey generally breeds in one locality, and often uses the same nest for several years in succession. The young birds seek new breeding grounds in any locality that suits them, near some lake, river, or the seashore.

S.—My pointer, Shot, 18 months old, was for the past week held his head on one side, as if the muscles of the neck were paralyzed. At first I thought that there was something wrong with his ear, but careful examination proved the contrary. He is in good health, appears lively, and shows no tenderness upon careful manipulation about the head and neck, but persistently drops his head over to the right side. He is a very valuable animal, which makes me desirous of obtaining all the information regarding the probable cause of the trouble. I may add that he is not overfed nor very fat, and has regular exercise. He gives no indications of discomfort whatever. If any of your correspondents can throw light upon the nature of the trouble and its treatment it will be highly valued by one who is not only a subscriber, but who takes pleasure in sending your admirable paper to many portions of the country, for which it is remuneration enough to hear, as one writes to me that he "so't up all night a readin' of it." Ans. We could only suggest what most likely has occurred to our correspondent S., namely, galvanism. Could any of our readers give any remedy?

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, APRIL 16, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notices of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

REMOVAL.

Hereafter the FOREST AND STREAM will be printed and published at 17 Chatham street, City Hall Square.

ARCHERY.

IT has been our province to bring before our readers occasional notices of English archery meetings. In such comments as we may have made on this most interesting topic, we have never failed to express our admiration for our foreign sisters, who, regardless of the pelting showers, have faced the elements, and shot whole quivers full of arrows indifferent as to the storm. We must confess to have held up these ladies as examples to our wives, sisters and daughters, whom we thought too frail to venture out in unseasonable weather. We ought, however, before this, to have recalled our expressions, since we heralded early in March last, an archery match held at Buena Ridge, Mott Haven, where numerous young ladies, from various parts of the country, showed their graceful skill, regardless of the inclement weather.

At the time of the match we were only too happy to herald the first archery meet of the season, and we trust that this spring and summer the FOREST AND STREAM may have its columns graced with the records of many such archery contests. We know of no amusement which is more pleasant or more health-giving, nor better calculated to give to women strength and gracefulness. If croquet has its charms, so has archery. If there is a question of agreeable excitement about either of them, we should award the palm to the devotee of the bow and arrow. What more charming sight than to see a pleasant lawn, and at one end the butts in all their bravery of red, black, white, and gold, and at the other a group of ladies in the most graceful of poses sending the hurrying arrows through the air, watching them describe their curves and dropping them plumb into the target. Then the merry laughter, the clapping of hands and the applause which greets the successful order, are all delightful.

In England there are societies of lady archers who have met regularly for the last 100 years. The ladies of Arden have twanged their bows ever since 1794, and the Golden Bugle and Arrow, won on such occasions, are treasured as heir looms. We shall be very happy to give the fullest information in regard to archery, believing it to be a recreation most thoroughly adapted to ladies, or to either sex,

and feeling certain that "the healthy body and the mind at ease," all depend very much on the pure air and active exercise, just such as an amusement of this character can give. We intend to devote considerable attention to this most graceful sport. We feel sure that it can be thoroughly introduced in the United States. It is true, archery does exist to a certain limited extent, but has not taken proper scope, nor is it known or appreciated as it should be. It wants popularizing. Central Park would be an excellent ground for archery meets in New York, and we feel sure the Park Commissioners, if asked, would give a good lawn for archery practice. If the sterner sex delight in rifles and Creedmoor, can we not have an archery movement in the country? It is the diversity of such out-door sports which gives a true zest for all exercises. If men take to cricket and base ball, shall not our women have something to relieve the monotony of croquet? We feel certain that any endeavors on our part to introduce archery on a permanent basis in the country, will be fully appreciated by many of our fair readers, for with old Ascham we say that archery is "the grandest sport for either man or fair dame or demoiselle that was ever thought of."

IMPORTATION OF PINNATED AND RUFFED GROUSE INTO ENGLAND.

A VALUED English correspondent sends us the following:—

"A few years ago there was published a very pleasant book on American field sports, entitled "Gun, Rod and Saddle," by "Ubique," an officer in the English army, who seems to have spent much of his time in the United States, in fishing and shooting. From the minute description the author has given of the habits of the ruffed grouse and the prairie hen, there is now a perfect mania in England among some of the sporting noblemen and extensive land owners to introduce these birds.

"Mr. Jackson Gillbanks, a distinguished naturalist and sportsman in the north of England, has taken a very leading part in the matter, and has been writing a great deal on the subject in *Land and Water*, the *Field*, and other papers. This gentleman strongly advises getting eggs, warranted sound, as he thinks that birds hatched in England would take to English food, and not be so apt to wander out of bounds, which is the great danger to every novelty. A club of noblemen and gentlemen is now forming for this purpose, and beg for the help of their American brother sportsmen. One large proprietor near the New Forest, Hampshire, writes: "I will give £10 to a fund to bring over either birds, or sound eggs, and can get a great number of my neighbors to do the same, and more, we will find the money if you will find a man to send, and another to receive them." A short time ago J. H. Bates, Secretary of Maclean county, Illinois, wrote in the London *Daily News* that he could send over to England, 2,000 prairie fowl at 10s. each, or £1 per couple, if subscribers to that amount would put down their names. However, his proposal met with no response. Mr. Jamrach, the celebrated importer of wild animals, of Wapping, wrote to *Land and Water* that he had two dozen couple at £2 5s. a pair. These were picked up directly. Surely, writes an English enquirer, they could be sent over for less than that. Now here is a new species of trade going a begging; our English friends propose Liverpool as the most suitable port to send them to, as it is the most direct passage across, and within reach of the Scotch and northern proprietors who would be the principal customers. We are satisfied from reliable information, that a consignment of either ruffed grouse, or their eggs, sent to Liverpool to an agent, or put up for sale by auction, would be a very profitable venture. And why not bring us the English pheasants, *Phasianus colchicus*, or their eggs back in return, to vary our list of game?"

Immediately on the receipt of this, we begged Mr. Charles Reiche, our well known animal and bird collector, to give us the fullest information in regard to the shipment of our birds for the benefit of our English friends. Mr. Reiche stated that it would be impossible to procure the eggs of either the pinnated or ruffed grouse. Apart from the difficulty of collecting them, the long transportation of the eggs by rail to New York would spoil them. As to the live birds, he says that during the months of December and January next he would agree to deliver in London or Liverpool one hundred pair of prairie chickens (pinnated grouse) in good order at the price of £1.10 shillings a pair. The order to be for one hundred pair and upwards. He expressed his desire to be able to send ruffed grouse, but declared that he was afraid that it will not be possible, because all attempts at caging the ruffed grouse have been unsuccessful, as they invariably killed themselves when kept in confinement. The well known standing and experience of Mr. Charles Reiche is a guarantee of his ability to fulfill any contract undertaken by him, and we would be glad to give our personal aid in furthering the views of our numerous English correspondents.

GEOGRAPHICAL RANGE OF THE MOOSE.

WE print, editorially, the following article from Rev. A. B. Lamberton, of Rochester:—

"As some few persons are still of the opinion that there are moose yet remaining in our State, it may be well to restate the reasons for the contrary opinion, which appeared in your issue of February 19th, together with others not yet published.

"In that article I did not venture to fix positively the time of the disappearance of the *alce* from the Adirondacks.

The most positive statement that I made on this point was, viz: "I think there has not been one killed within the State for the last sixteen years," and so far as the facts which have since appeared are concerned, this statement was approximately correct. E. C. S., (FOREST AND STREAM, March 6th,) furnishes evidence of a moose having been killed in the vicinity of Racquette Lake, New York, in 1861, thirteen years ago." The Albany *Argus* informs its readers that "it is said that Gov. Seymour shot one in that locality, (North Woods,) about fifteen years ago. I have also in my possession a letter which was sent to W. W. Ely, M. D., of this city, from Reuben Howard, one of the old experienced moose hunters of the wilderness in which he says, "the last moose I killed was thirteen or fourteen years ago," and then after speaking of two that were killed year afterwards he adds, "I have not seen or heard of any since, not positively."

"Were moose not wholly extinct in our State, our guides and trappers would know something of their whereabouts. We are however assured that "old and experienced guides do report the existence of moose tracks, in the neighborhood of Mud Pond." From personal observation we may be permitted to deny this statement. Some three years ago a guide came in and reported having seen moose tracks in the vicinity of the above pond. Of course his story was not credited. Three or four of the oldest guides present told him that there had not been any moose in any part of the wilderness for years. I encamped the same season near this pond for two weeks when I explored every swamp and morass within its vicinity without meeting with a single track or sign of moose. Guides who are constantly discovering the tracks of these animals should be able to find their yards—feeding pastures—without much difficulty. When we ask them to show us the tracks, they reply that the rains have washed them away. But where are the signs of their feeding? These will remain for years. The tracks of moose that these guides find are worth about as much to the naturalist and sportsman in guiding them to the animals as all the "Will-o'-the-wisps" that dance over the marshes. I defy any person to point to a single indication of the presence of these animals in any of the vicinities named in the *Argus* as containing moose. We are told that Mr. Fenton during last "August encountered the fresh tracks of a three year old moose, between his residence and Stillwater on the west line of Herkimer County." The answering of such an assertion is out of our province. It is not admissible as any kind of evidence in an article on Natural History. These tracks might have been those of a young ox or of an immense buck. A young moose will not make on a hard road larger tracks than will either of these animals. As to determining the age to the exact year of an animal by its tracks, is too novel for comment. "When the few numbers now remaining," of which the above paper speaks shall be found, we have no doubt the Legislature will act upon its suggestion and protect them. It would seem, however, useless, since these animals have protected themselves so well for the last ten years, that no reliable guide or sportsman has seen or heard of one of these quadrupeds."

A letter from Superior City in Northwestern Wisconsin, under date of March 31, says:—

"The last week has been favorable for killing moose. Eight have been brought in, and most of them in good condition. The butchers sell the meat at the stalls at the price of beef, and it is much relished as being more tender and sweeter than beef. The deep snow and heavy crust makes it impossible for the animals to move about, consequently they become an easy prey to the hunters."

Our readers must not imagine that because the animals were killed at Superior City, they are natives of Wisconsin. It is most likely the moose have come down from the neighborhoods of Dog and Red Lake, also the Lake of the Woods in British America, where they still exist in considerable numbers.

HYDROPHOBIA.

THE following method of treating hydrophobia will doubtless be read with interest. It may be remembered that Dr. Pancoast wrote to us in reply to an inquiry of ours made to him that "fortunately cases of hydrophobia in man are of rare occurrence, and few if any physicians have had sufficient experience in the treatment of such cases to render their opinions entitled to very strong consideration." Dr. Yarrow having had several cases of hydrophobia under his care, his letter may perhaps throw some new light on the methods of curing those unfortunate persons who may have been bitten by mad dogs:—

UNITED STATES ENGINEER OFFICE,
Explorations and Surveys West of the 100th Meridian,
WASHINGTON, D. C., April 3, 1874.

EDITOR FOREST AND STREAM:—

As the subject of hydrophobia appears to be attracting considerable attention at the present moment, perhaps I may be permitted to give an account of the successful treatment of three cases of persons bitten by rabid dogs occurring in my practice while on duty at Fort McHenry, Baltimore, Md. The first case was that of my own son, a boy of eight years of age, like his father very fond of dogs, and to this fondness his misfortune may be attributed. A strange dog of mongrel breed had entered the yard and without apparent provocation the animal sprang on him and bit him in no less than six or eight places, on both hands and on the right shoulder. At the time I was absent in the city of Baltimore, but the hospital steward at once applied nitrate of silver after having first washed the wounds carefully. Upon my return, not being altogether satisfied with the mode of treatment, and having heard from some of the soldiers that the dog had been seen for several days wandering around the post, snapping and biting at other dogs, with a mucous discharge and slight cough, I deter-

mined on a more energetic plan of treatment, and after having applied local anesthesia to the parts I carefully excised each bite, going down with my scalpel to the bottom of each wound, after which fuming nitric acid was applied for two days in succession. This treatment was supplemented by the use of fermented poultices made with Indian meal and yeast, to encourage the throwing off of the slough. In three weeks the wounds had entirely healed and no bad effects have thus far resulted; this occurring in 1870. I should perhaps mention that this dog bit a number of other dogs who were all unmistakably afflicted with rabies and were accordingly killed. Some two months after this case the second occurred in the same neighborhood and was treated in the same manner and with a like result. The third case was one which occurred at Harrisburg, Penn., and the patient was not seen until three weeks after the reception of the injury. He was treated in the same manner and no evil effects manifested themselves, although the man's mental condition was in such a state that an attack of brain fever supervened, in which he nearly lost his life. As corroborative evidence in favor of this plan of treatment, I may mention that a person bitten at the same time as case number three, and by the same dog, died two months after of hydrophobia, although his wounds had been cauterized with nitrate of silver. This heroic plan of treatment which I have adopted and which I should use under nearly every circumstance, I offer for the benefit of your readers, believing it to be one of the very best.

Very truly yours,
H. C. YARROW.

AMATEUR RIFLE CLUB.—Tuesday the 7th was held a meeting of the Amateur Rifle Club, Col. Geo. W. Wingate, the President, in the chair. After calling the meeting to order the Chairman remarked, in relation to the proposed acceptance of the international challenge by the Amateur Rifle Club, that he had no doubt but the match could be carried out, there being no apparent obstacles to it. After reading the minutes of the previous evening, Mr. F. P. Fairbanks, the Secretary and Treasurer reported that the funds of the club amounted to \$600, which he had deposited in bank, and that the present membership numbered seventy-eight. Letters of encouragement were read from the Messrs. Remington and Mr. S. H. Green, Secretary of the Sharpe Rifle Company, regarding the proposed match with the Irish eight, each enclosing \$250 to defray the expenses of the competition. Mr. Richards offered the following resolutions, which were adopted:—

Resolved, That the action of the Executive Committee in regard to the Irish challenge, meets with the approval of the members of this Club, and that it is hereby directed to accept the same.

Resolved, That the Secretary be directed to convey to Messrs. Remington and Sharpe the thanks of the members for the generous donations lately made by those firms towards the expenses of the Irish match.

The following, offered by Lieut. Col. Gildersleeve, was also adopted:—

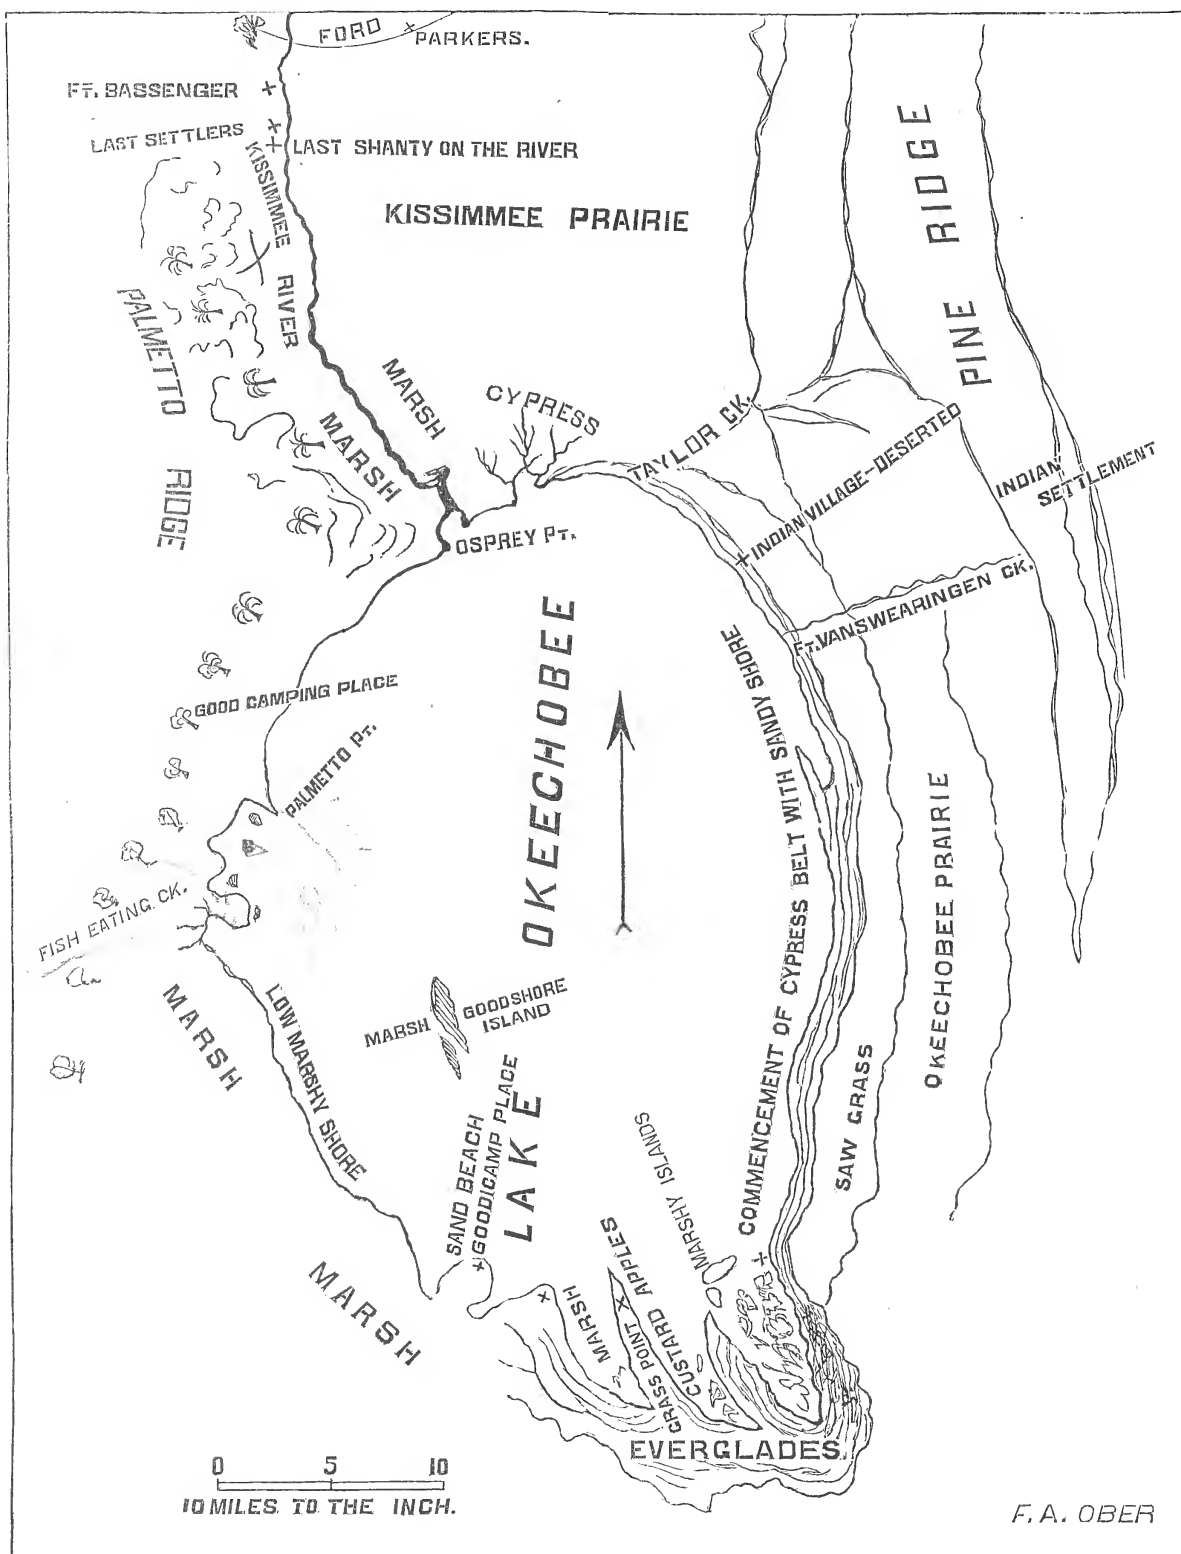

Resolved, That the matter of procuring designs for a badge to be worn by such members of the club as are willing to procure the same, be referred to the Executive Committee with power.

On motion, it was agreed to appoint a committee of three, with instructions to provide a suitable building at Creedmoor for the use of the club. The election of officers was then held, and resulted in the re-election of the present board as follows:—President, Geo. W. Wingate; Vice President, Henry A. Gildersleeve; Secretary and Treasurer, F. P. Fairbanks; Executive Committee, Henry Patton, J. T. B. Collins, S. S. Schiermerhorn, A. Alford, and L. Brece. The Chairman stated that a communication had been received from the National Rifle Association, announcing that the work of preparation of Creedmoor for the coming season was being rapidly carried on by twenty men employed for that purpose. It was decided that the matches of the club be held on Saturdays, twice a month, at 10 o'clock in the morning or noon, to be shot at a distance of 800 and 900 yards, two sighting shots and five scoring shots at each distance; also the Executive Committee be authorized to provide the badge to constitute the prize. A motion was adopted directing the Executive Committee to prepare rules for the prevention of carelessness in the use of firearms at the matches, and that no two men be allowed to use the same gun at the same match.

—Some time ago the Fish Commissioners of Pennsylvania purchased from our State Hatching House 104,000 salmon trout eggs. They were conveyed from Rochester to the Pennsylvania Hatching House, near Marietta, and were successfully matured. The young fish were quite recently deposited in the Schuylkill River, near Morristown. There is little doubt but that in time this most useful fish will be thoroughly introduced into the larger Pennsylvania rivers.

LAKE OKEECHOBEE, FLORIDA.

It is with no small satisfaction that we are enabled this week to announce the complete success of our expedition which was fitted out last December for the exploration of Lake Okeechobee, in Florida, and to present to our readers the first map of that mysterious body of water ever published! In another part of this journal will be found a detailed description of the lake and the journey thither, written by our indefatigable commissioner, Fred Beverley, as he is pleased to sign himself for the present. Some faint idea of the difficulties that have attended his explorations may be gathered from the fact that his is the only attempt (including several made this winter) that has been successful within the last twenty years to reach the

lake; but these difficulties assume a more horrible and tangible realization when it is known that more than twenty miles of the journey was accomplished by wading and pushing their boat by hand through swamps swarming with alligators, and infested with poisonous snakes and all kinds of creeping, stinging, and flying vermin. Mud, water, and heat made the transit most fatiguing, trailing vines that constantly barred their progress had to be cleared away, and whenever they found a bit of *terra firma* solid enough to camp on it was scarcely more than six inches above the surrounding mire.

Of the lake itself few praises are to be sung. The practical value of its location and discovery are scarcely a sufficient reward for the pains and expense involved in getting to it. Scientifically, our commissioner's efforts have been most satisfactory. Besides taking photographic views of all available points of interest around the lake, and on the journey thither, he has catalogued a list of sixty-two varieties of birds found there, a full description of which we shall print next week, the same being the first ever given. Professor Grey, who accompanied our commissioner, has also a full list of plants. Five weeks were employed in exploring every inlet and bayou of Okeechobee, so that nothing now remains to be discovered or written. Mr. Beverley had the experience of several previous efforts to aid him, as well as a most complete outfit of boats and camp stuff brought from the north and obtained at the settlements nearest the lake, with good guides, tools, instruments, etc. He is now among the Indian villages on Okeechobee, and hopes to forward us another letter in a fortnight. Our latest advices are to March 25th.

—The Lockport Shooting Club have arranged for a shooting tournament there, commencing Tuesday, April 21st, and continuing three days. It will consist of trap and rifle shooting. Buffalo, Rochester, Syracuse and Canada sportsmen will be out on the occasion in full force.

GAME PROTECTIVE SOCIETIES.—We are very much gratified to note the rapid increase of associations all over the country for the protection of game. No better evidence can be afforded of the wide spread interest that is felt in this all important subject. These organizations are the first practical results of the direct efforts that are now being made to accomplish what has been so long left undone through inefficient but well intended legislation. Prominent among the most recent organizations are the State Sportsmen's Societies of Maine, Missouri, Ohio, and Illinois; the West Jersey Game Protective Society; the Sportsmen's Club of Western Pennsylvania; the Game and Inland Protective Society of Nova Scotia; the Georgia Sportsmen's Club; the Massachusetts Anglers Association; the Cuvier Club, of Cincinnati; the Octoraro Club, of Pennsylvania, and the Sportsmen's Club, of Manchester, New Hampshire. Many other clubs, numerically of less importance, have been formed in various States and in the Provinces, notably the Forest City Shooting Club, of Portland, Maine, the Bluff City Shooting Club, of Memphis, Tennessee, the Forest and Stream Club, of Brainard, Minnesota, and the Toronto, Canada, Gun Club. Besides a Fishery Commission has been appointed for Maryland, with two efficient officers; and state game laws have been established in Colorado, California, Minnesota, and Nevada, where they did not exist before except in name. In Ohio the movement for protection has been so earnest that it has taken political shape, and the State House has been for weeks the hardly contested battle ground of factions backed by petitioners 30,000 strong on either side! But while the measures now before the legislature may be defeated through their unreasonableness and imperfection, out of the awakened interest has arisen an earnest desire for a National Convention whose wisdom shall harmonize conflicting interests and so codify existing game laws as to make them just, sensible, and of practical utility. There is no doubt that a National Convention will be speedily called. The country needs its aid and would profit by its action. All isolated efforts merely add to the confusion, and while they plainly indicate the general mood, they but emphasize the necessity for combination.

The following is a list of officers of the Game Protective League newly organized at Manchester, New Hampshire:—President, John B. Clarke, Manchester; Secretary, William W. Colburn, Manchester; Treasurer, Frederick Smyth, Manchester; Vice Presidents, Rockingham County—Marcellus Elbridge, Portsmouth; Strafford—Luther C. Critchett, Strafford; Belknap—G. V. Pickering, Laconia; Carroll—William C. Fox, Wolfborough; Hillsboro—Elbridge F. Perkins, Wilton; Merrimack—John M. Hill, Concord; Cheshire—C. H. Henderson, Keene; Sullivan—William Jarvis, Claremont; Grafton—Burns W. Pattee, Enfield; Coos—Nathan R. Perkins, Jerson.

The officers of the Georgia Sportsmen's Club are:—President, J. D. Weed; First Vice President, Robert Wayne; Second Vice President, M. McLean; Cor. Secretary, W. H. Connerat; Recording Secretary, George E. Alden; Treasurer, J. H. Heyward.

—The monthly meeting of the New York Society for the Protection of game was held on Monday evening, April 12th, at the house of Wm. C. Barrett, Esq., in 39th street. There was a full attendance of members. Much valuable information was elicited by a discussion as to the expediency of prohibiting the spring shooting of woodcock, and other migratory birds and fowl. It was shown that the birds were full of eggs at this season, and by no means always in prime condition.

Mr. Hallock's scheme for co-operative legislation was taken up, and placed in the shape of a series of resolutions which were referred to a committee.

THE REICHE CARAVAN.—Some time ago we wrote a brief account of Mr. Reiche's establishment in this city, devoted to the collecting and disposal of wild beasts, birds, and reptiles. Mr. Reiche informs us, that when last heard from in Egypt his train of animals were en route from Nubia, following the Nile, their objective point being Suez. The party have under their charge thirty-one giraffes, seven elephants, three double horned rhinoceri, innumerable antelopes of new varieties, and a whole flock of ostriches. A certain number of the animals will be disposed of on the continent, but no doubt some of the finest specimens will come to this country. Enterprise in such matters is always wonderful, and it is indeed marvellous that an American house should command the wild beast market of the world.

Sporting News from Abroad.

Mr. Ruskin, the many-sided critic, ever as ready to discuss the merits of a Turner as prone to argue on the comparative necessity for an improved series of Napier's Logarithms, has of late been airing the best of English in regard to the recreations of the 'Varsity men. "It is all very well in its way," he says, "for you, gentlemen of England, to run and jump, box, play cricket, and pull boats, but don't you think you might turn your thews and muscles to some better account? Now, for instance, instead of your working yourselves to death in a boat, straining your heart-strings in order to gain the honor of a paltry race, why don't you strip and take a harrow or a spade and dig ditches, or plant trees, or grow turnips, or do something which may benefit mankind either in an agricultural or in a landscape gardening point of view? In this way you would not only improve your healths, but be of a real benefit to mankind." These are not exactly the words the great English art critic uses, but they embody pretty much his thoughts. Of course all ideas of this character are as impossible as they are utopian. They call for an utilitarian principle in man, which does not exist. As well declaim against race-horses, and want them all to be yoked to the plow or harrow, or insist that all fox hounds, pointers and setters, should be either turn-spits, or used to draw, as do some unfortunate curs in France, the burdens. Some people must delude while others must dance. There are men who would pine away and grow rusty both in mind and body, whose backs would be forever bent, did they spade and shovel, no matter were they certain that in time to come some noble grove of trees planted by them shading the way, or a fair route constructed by their hands leading to a beautiful country, were the certain ends of their toil. We must have in this world objects and aims which flatter ambition, which the world may immediately speak about. They may be evanescent—ephemeral, if you please, but the present satisfaction they give is worth ten times the future encomiums they may receive. As well say to young people who dance, "Tis waste of time! Are you acquainted with the enormous power you are wasting in the *valse à deux temps*? Have a tread-mill erected in your ball-rooms; tramp away on that altogether; convert yourselves into so much horse-power; attach a series of looms to your wheel, or the saw of a lumber mill, and you will be surprised at the amount of work you will accomplish." Mr. Ruskin had better find a new Turner, and let athletic amusements alone for the nonce. There is a deal too much of the *doctrinaire* about Mr. Ruskin of late to please us. But while commenting on art critics, it gives us pleasure to notice that Mr. Buckland is busy among the Landseer pictures. It seems that in one of Landseer's works, the "Deer Fighting," a picture in Dunrobin Castle, on the broken antler of a red deer there is a single drop of blood—but one. Here now comes in the question for the naturalist: Does any blood come at all from an old horn on a buck's head? The subject might be, we think, disposed of at once, by simply imagining that the *goute* of blood came from a lunge the angry deer had given his enemy, and like a warrior, the conquering buck had moistened his glave in his adversary's heart's blood. Mr. Buckland, however, goes through the whole catalogue of Landseer's pictures, and finds, *mirabile dictu!* that the greatest of English animal painters always used a little bit of red somewhere. And why not? Is red a forbidden note—a discord in the gamut of colors? One thing certain is, that Landseer wanted color badly, and felt that his pictures were too often *morue* and *terne*, over-sad, subdued-like in tone, and with mindful artistic acumen, stuck in a little bit of brightness—sometimes even a little out of place, whenever there was an excuse for it.

—If Eton, Harrow or Rugby, famed for cricket and football, in the opinion of many only make sturdy batsmen, bowlers or kickers, can they do anything more? If our own Harvard or Cambridge athletic exercises make chests to grow broader and give more lung capacity, increasing flexors, do they diminish the mental powers? We have in England some glorious triumphs in the Classical Honor Lists. Here are Harrow men reported as taking all the gold medals for the Greek and Latin odes. As remarks most justly our English contemporary: "These are a sufficient argument against people who think only of such ancient foundations as seminaries for young athletes." A man may, therefore, be stroke-oar and be up in Euripides, and measure 42 inches around the chest, which by no means implies a want of brain capacity. The ideal man, the paragon of human beings, is he who can lift a ton weight without turning a hair, and then read Pindar without making a false quantity.

—Mr. Ashbury, in his steam yacht Eothen, may be said to have made a prolonged cruise. Starting in August, 1873, visiting the Cape de Verde Islands, and finally Brazil, in January of this year he left Montevideo, and has just returned home from Montevideo to the Eddystone. Some 7,000 long miles is a fair trip. Total distance sailed, 14,250 miles. The greater part of the voyage was made with sails. Under sail on March the 1st the Eothen made 200 miles. We may not exactly think Mr. Ashbury's yachts, (we mean such as he brought to the United States) can compete with our own, but no one can gainsay the fact, that the owner of the Eothen is a thorough devotee to sailing. The time will not be far distant when our California friends will heave up the anchor on some trim pleasure craft, glide out of the Golden Gate, touch at Otahiti, and with a clean pair of heels never stop until they sight Japan or China; thence round the coast to Bombay or Calcutta, then make

for the Persian Gulf, the Red Sea, and the Lesseps Canal; then onwards to the Mediterranean, through the Straits to the Atlantic, and then through the canal across the Isthmus Darien (for it will be built before ten years are over), and home again to San Francisco. We know we are prophetic, but all will be done some day (the trip and the canal), and the FOREST AND STREAM will live to record it.

—From *Bell's Life* we find anticipations in regard to the coming field trials at Shrewsbury. Field trials are now national institutions in England. It is believed that even in the greatest country in the world for field sports, by field trials the many admirable points of the pointer and setter will be better appreciated, and then gentlemen understanding how much pleasure can be derived from having perfectly trained animals of pure race, will give over effeminate and murderous battues and drivings. The prestige of a dog who wins at a field trial is ten times greater than any honors to be acquired at a dog show.

—The Inter-University sports took place on the 28th of last month. We can give but a short resume of the clever performances. Oxford won the high jump, Brooks clearing 5 ft. 10 in. Cambridge won the 440 yard race. In putting the 16 lb. weight Oxford won with a throw of 37 feet 11 inches. In the mile race, Sanford of Oxford came in ahead in four minutes forty seconds; at 100 yards Cambridge won. In throwing the 16 lb. hammer, Hales, of Cambridge, threw 126 feet 9 inches. In the 120 yards hurdle Oxford won. In the long jump Cambridge again took the honors, its representative clearing 22 feet 10½ inches. In the last contest—the three mile race—it was the turn of Oxford, Stevenson winning leisurely in 15 minutes 43½ seconds. Oxford having won most of the prizes, was declared the victor. There have been eleven competitions so far, five matches having been won by each. There was a tie in '64. Is it beyond the range of possibility to get up a match of this kind at home some of these days?

—Where will not the ubiquitous Yankee and his peculiar notions go? Scarcely in the habit of advertising gratuitously, we still copy from a Paris paper a notice of this character: "*A vendre. Un trotteur Americain. Tres brillant.*" And: "*Un Sulky de course, à tres peu seroi. Poids 30 kil.*" Unfortunate nag! Unhappy vehicle! They may use the former, but what on earth will they do with the latter? Perhaps mount a mitrailleur on the sulky, and use it in some future campaign.

Shot Gun and Rifle.

APRIL IS A CLOSE SEASON FOR GAME.

—Wild ducks have not been as plenty in a good many years as they are about the Montezuma marshes and swamps this spring. The black ash swamps are teeming with the dusky, grey and wood duck in the vicinity of Seneca River, and gunners are having fine sport in stalking them among the timber. English snipe have also commenced to arrive and the Onondaga sportsmen will soon be skirmishing along the Montezuma flats.

—Syracuse is the residence of many of the children of Nimrod and Walton, and has two of the most flourishing sportsmen clubs in the State. Mr. Frank Klock is President of the Central City Club, and new officers of Onondaga Club have just been elected, viz:—President, F. E. Carroll; Vice-President, S. W. Sherlock; Secretary and Treasurer, John Stedman; Financial Secretary, E. H. Mann; Attorney, D. J. Mitchell; Executive Committee, Thomas Kimber, Charles H. Finch, John Bedford.

—A Washington correspondent says, under date April 10th:—"Northwest winds and rough water have interfered much with the duck shooting during the last week. The box is the form of approach generally used here, and its use is impracticable but in smooth water. Ducks were never more plentiful. On a trip from the city to Mount Vernon, on the 2d inst., we started up flock after flock of thousands of red heads, black heads and red necks. Canvass backs getting scarce and not found in flock with other ducks; now and then a little flock by themselves. They are getting fishy in flavor, feeding now principally on the minnows and thread herring. The other named ducks have become too fishy to retain any value for the table. Jack snipe, season just opening, are quite plentiful and in plump good condition. A gunner wading the magazine marsh put up twenty-one in a half mile tramp, bagging seven."

—Messrs. Ira A. Paine of New York, and E. W. Tinker of Providence, shot a match at pigeons at Providence, Rhode Island, on Saturday, April 11th. The conditions of the match were to shoot at twenty-five yards rise, ground traps, five yards apart, 14oz. shot. The birds arrived on the ground in only fair condition, as they had to be transported by steamer from this city and were evidently sea-sick. Notwithstanding this slight drawback there were a large number of field sportsmen present, the members of the Narragansett and Boston Clubs attending in a body, and at the solicitation of Mr. Henry Bergh a number of gentlemen from the Rhode Island Society for the Prevention of Cruelty to Animals, who expressed themselves on the ground as follows:—"They could detect no more cruelty than was necessary in the killing of game-birds in the field, in fact the birds were more expeditiously killed than it was possible for a sportsman to carry out in field shooting." The match was won by Tinker, killing thirty-five birds to Paine's thirty-three.

—The Philadelphia Sportsmen's Club will hold their fifth social meeting on Saturday, April 23d, at the Tinicum Fish House. A shooting match for three prize medals by mem-

bers of the club will commence at 11 o'clock, A. M., sharp, entries close April 23d. A special train for Tinicum will leave Gray's Ferry Station, at 10:15, A. M., returning, leave Tinicum at 6:50, P. M.

—The Bluff City shooting Club of Memphis, Tenn., held their second match for the possession of the Champion Cup of the Club last week. The match was at five double birds, eighteen yards rise, 100 yards boundary, the club rules to govern. The weather was much against both the birds and shooters. At the first match Mr. Bryson killed seven out of five double rises and carried off the prize. The second match Mr. R. W. Lightburne won the prize after shooting off the tie with Mr. Specht:—

THE SCORE.		Scored.				Total.
Name.						
Jos. Specht, Jr.	11	*00	11	10	01
R. W. Lightburne			11	11	01
D. D. Saunders	10	10	11	*00	*00
William Bowles			10	11	10
J. W. Alley			00	11	00
A. F. Granger			10	01	10
P. Bryson			00	*00	11
E. W. Welles			*00	11	01
D. O. Dyer			00	10	11
D. Bryson			*00	01	10
J. M. Rodgers	10	11	*00	*00	00
S. L. Burdick			00	00	00
*No birds.						

Messrs. Lightburne and Specht shot off the tie at twenty yards at three double birds each. Mr. Specht killed only three, and Mr. Lightburne killing five out of the six, won the match and cup.

—An old hunter of many years' experience, who resides in the wilds of Pennsylvania, sends us the following notes relative to McKean, Cameron and Wyoming Counties, a region that we receive frequent inquiries about:—

LOVELTON, Wyoming County, Pa., March 9, 1874.

EDITOR FOREST AND STREAM:—

I have had some considerable sport in still hunting deer in McKean, Cameron and Wyoming Counties. In the two former, in the fall of 1859, I took my first lessons in the art with an old hunter, W. T. You may think I liked the business well, as I did not lose a day's hunting in five weeks (except Sundays). We still-hunted, when there was no crust on the snow, or enough to make it noisy travelling, as anyone knows that is acquainted with still-hunting, and when there was too much crust, we generally drove the deer, one of us taking the fresh trail and following it and the other heading off. In this mode the one that heads off should understand the ground well and the runways. So I generally had to do the trailing, and in this I would sometimes get a shot. If a hunter understands the ground thoroughly, he can start a deer and head it off many times alone, if he ain't too lazy. This often makes lively and exciting work and serves to warm up a person thoroughly and makes a very agreeable change, after getting pretty thoroughly chilled by the slow movements that are necessary, at times, in order to get a shot. While we were hunting in Cameron County, along the spurs of the mountain that faced the Sinnemahoning Creek, W. T. had the satisfaction of killing five deer in one day, and all alone. Starting them in the head of the hollows between the spurs, they generally would run around the point of the spurs, so that by crossing over from the head of one hollow to the next, he would head them off. I tried this one day, starting two deer; they made around the point, and I started over across to head them off, and as I gained the top of the hill I looked down cautiously to see if I could see anything of my game; but instead of seeing the deer that I had started, I saw a large buck lying down on a sort of bench down the hill. But as his head was turned directly toward me, I was afraid to move for fear of starting the old fellow. So I trusted to my chances of hitting him by rising on tip-toe on the brush and limbs that were in the way. The result was that I did no harm, except to scare him, and as he went away another deer followed that had laid out of my sight. And this was not all. Before I could get my gun loaded, along came the other two deer that I had started and was trying to head off. But I have learned now to hunt with a different gun than a single-barrel, muzzle-loader, as I use now a breech-loader, either single shot or a repeating gun, and think that it would be difficult to persuade me to go back to the use of a muzzle-loader of any description. I have also found that too light a ball is objectionable. I used one season a gun that carried a ball of about 120 to the pound, and I lost as many as I killed, when a ball twice as heavy would have killed them all. It is bad enough to shoot a deer down dead, let alone having to shoot them three or four times, or else they get away and perhaps die. Besides I had rather follow a well deer than one slightly wounded, as they are more on the look-out and not feeding much. The practice of hounding deer, that I cannot sustain. A deer that has been run any length of time is not fit to eat, and he that cannot kill his deer without hounding is no hunter, and I think the time is not far distant when this practice will be prohibited wherever there is deer. The wilderness in this and the adjoining county has been famous the past six years for the nesting of pigeons, except last year, but the beech-nuts are so plenty this season that we look for them back. Deer have been plenty this season, and so have hares, and all fat. We have a large wilderness here yet of some 40 miles square. Considerable many trout are caught here in their season, but there are too many fishermen to have good fishing.

TUSCARORA.

NEW YORK, April 6, 1874.

EDITOR FOREST AND STREAM:—

On Good Friday I went out on Long Island, hunting for snipe. I hunted all over but did not find any, and on my way home, as I was crossing the meadows I struck on a spot where there was a small pond, and the water was about three feet deep, and as I neared the pond I heard a Quack! Quack! noise. I immediately brought my gun to full cock and kept a steady look out, as I thought to see a duck raise every moment. The quacking continued. I walked over in the direction where I heard the noise, but could see nothing. After a while I heard the quacking very distinctly in three different places, and I thought of course that it was ducks calling each other. I waded around for about two hours, but I found no ducks, so I discharged one of the barrels of my gun, as I thought that would scare them up, if anything would, but no ducks raised. It is the most curious thing that ever happened to me. Have you ever heard of an instance of this kind? Please answer, or clear this mystery for me. By so doing you will much oblige.

There were indications of ducks all round, as the grass was cut short as if ducks had been feeding there.

G. T. J. O.

Did our correspondent mistake the Scaipe! Scaipe! of the snipe?—Ed.

SAN FRANCISCO, Cal., March 31, 1874.

EDITOR FOREST AND STREAM:—

I want to know what is the opinion of riflemen generally in the east as to the relative merits of breech and muzzle loaders for accuracy as target rifles, especially at long ranges. Considerable experimenting has been carried on in San Francisco, for the purpose of testing rifles, by firing them from a machine rest at all ranges from 230 to 2,000 yards, and we have never yet found a breech-loader which could compare with the muzzle loaders, especially above 200 yards. To illustrate: One target has been made here at 230 yards (in the open air, where the wind had to be calculated for) of 100 consecutive shots, only one of which was outside a four inch bull's eye, and the total string measured 93 inches and a fraction. If you will notice, most of the shooting done at Creedmoor last year was by breech-loading guns which won all but one of the prizes. If we look at the experience of the English who, remember,

have been shooting at long ranges for fifteen years, many of their breech-loading rifles do excellent shooting, they say, at 1,000 yards in favorable weather; but in any competitions where any rifle is allowed, the muzzle-loaders are always used. A good example of the accuracy of the Rigby rifle is shown in last year's contest for the shield. There was a strong puffy breeze from the left front (nearly in front) during the whole of the 1,000 yards shooting, yet the Irish team put all but 3 of their 120 shots on the target, and six of them put all of their 90 shots on. Wilson's score, as you will see, was 11 bull's eyes, 1 centre, and 3 outers. All this may be old to you; if it is pray excuse it. But I would not like to see our team beaten, and if you find one suggestion for a text, I shall be repaid for writing the above. Respectfully, G. H. S.

The inquiries put by our correspondent G. H. S. are very much to the point, and we trust shortly to be able to answer the question of muzzle-loaders vs breech-loaders in full.—Ed.

SAN FRANCISCO, Cal., April 1, 1874.

EDITOR FOREST AND STREAM:—

Company E, First Regiment N. G. C., to improve themselves in rifle shooting, have instituted a series of matches, dividing the Company into three classes, each class shooting for a badge at distances suited to their skill—the third class 10 shots at 100 yards; second class 5 shots at 100 yards and 5 shots at 200 yds.; first class 10 shots at 200 yards. I append the score of the first class at the match shot March 29. Rifle, Sharpe's military, new model. Distance, 200 yards; 10 shots. Wind, moderate, parallel to line of fire. Target, 4x6. Bull's eye, 8 inches square.

—The change of targets at Wimbledon, mentioned by us, has of course caused a certain amount of controversy in England. In the *Volunteer Service Gazette* we find a long letter from Edward Ross, the well known rifleman, in opposition to the change, and one from Major Leech, which we publish:—

DUBLIN, MARCH 26, 1874.

SIR.—I so rarely trouble the *Volunteer Service Gazette* with a letter, that perhaps you will concede to me the privilege of now doing so, with the view of eliciting public opinion on the sweeping and unexpected target changes lately proposed for Wimbledon, to be adopted, it appears, by the N. R. A.

These alterations appear to me to have been too hurriedly made, and the subject of paper *versus* iron targets has not been sufficiently discussed, nor any committee, that I know of, formed to inquire and report upon the relative merits of each.

As I understand it, the hits are to be indicated on a dummy target, distinct from the paper target, which latter moves down to be mended after each shot, and then moves up again; and the tired soldier takes little or no interest in the proceeding, but with every disposition to do what is right, indicates *tolerably* near, perhaps, where the shot hit.

The maker has little to guide him, as the projectile from a small bore almost *glides* through the paper, and there is trouble in finding a hole little bigger than a pea.

The constant strain upon the attention of the marker, even assuming the aid of an intelligent non-commissioned officer, will be over-much for him to mark with sufficient precision for match-shooting purposes.

At present the hit upon the target calls the marker to attention, and the splash of the bullet makes its position sufficiently visible, an advantage also possessed by the shooter with the aid of a telescope.

The proposed system is not suitable for Wimbledon, where speculation should have no place, and where all reforms should be introduced after proof of their value and necessity.

I believe the opposition to this innovation will be both loud and just.—I have the honor to remain, your faithful servant.

ARTHUR B. LEECH.

We believe that we repeat the feeling of our own N. R. A. in regard to the changes at Wimbledon in the form of the targets, when we reiterate the statement made in our last that at least for several years to come the old forms of targets will answer our purposes fully. Please gracious, when we are thoroughly proficient, we will devise a new system of target, if necessary, for ourselves. As it is, for comparison sake, we can use the Wimbledon scores of the last fourteen years.

—Some time ago we expressed our doubt as to whether a muzzle-loading fowling piece could be converted into a breech-loader, so as to give entire satisfaction. We are, however, in receipt of the following from a correspondent in Corinth, Mississippi, under date of April 3d, which pleases us to give verbatim:—"Messrs. Clark & Snider, of Baltimore, altered a gun for me from a muzzle-loader to a breech-loader. I cannot say too much in praise of the work. It works admirably, and I sincerely trust that sportsmen in their section of country who have good muzzle-loaders and want them altered will send them to Clark & Snider, for they can make such change without injuring their shooting qualities or adding to the weight of the gun. R. Y."

MEETING OF THE NATIONAL RIFLE ASSOCIATION.—On Tuesday last, the 7th April, as we were going to press, was held the 25th regular meeting of the Board of Direction of the National Rifle Association. The Committee on the range reported that the damage caused by the rains of the winter was fast being repaired, and the hope was expressed that by the 1st of next month everything would be in order. The question of inaugurating the coming season with a spring match was referred to the Executive Committee with full power to act. A balance of \$600 was shown by the Treasurer's account, all of which will be wanted for the repairs at Creedmoor. Measures were proposed for the further propagation of sound ideas on the question of rifle

shooting, and it was determined that members of the association should do all in their power to induce their friends to enroll themselves in the N. R. A. It was announced that Company I of the Seventh had joined the association. The meeting was of the most harmonious character, and the interests of the association will no doubt be fully cared for by the officers. There were present the Secretary, Col. Gildersleeve and Messrs. Wingate, Smith, Casey, Church, Shaler, Woodward, and McMahon.

EDITOR FOREST AND STREAM:—

Will you permit an old and now superannuated rifleman a word or two in relation to the proposed International Rifle Match, in which I naturally feel a deep interest? What has most struck me in regard to the regulations is—first, the distance; second, the absence of all restrictions relating to the time that is to intervene between the raising of the rifle to the shoulder and the firing; third, that nothing is said relative to "arm or body resting." The distances respectively are 800, 900 and 1,000 yards. These may be all right if the practice is for military purposes only; but if for sporting, these ranges are, if not wholly, at least largely too great. In this country—excepting of course in war times—the rifle is used mainly for sporting purposes, and sportsmen will, I think, agree with me that it is rarely that they are called upon to draw trigger upon game at such ranges. Second, the absence of restriction in regard to the time allowed the shooter between the raising of the rifle to the shoulder and the pulling of the trigger. Sportsmen who are desirous of becoming rifle experts will soon learn to know how much of their success will depend upon quickness of aim. To take a deer "on the fly" or even to dislodge a squirrel, at times requires sharp practice, and this will certainly not be attained by adherence to the printed regulations in your last issue. Third, the silence in regard to "arm or body rest." By this, I mean the resting of the elbow of the left arm on the hip, which is a natural, if not an artificial rest. Offhand rifle shooting I have always understood to be the holding of the rifle in such a way that the left arm shall not touch the body except at its natural connection at the shoulder.

All these objections may be provided against in the Wimbledon regulations for 1873, by which, I observe, the match is to be governed; if not, do you not think them worthy of attention, if not in this contest, at least in those of a purely sporting character? I am aware that there are those who ridicule the idea of rifle shooting at such distances as 40, 60, or 100 yards, but let such try their hands at it and they will find that it is not the easiest thing in the world to strike a three-quarter-inch mark half a dozen times in succession at forty yards, or, as your correspondent "Ogils" remarks, "to hit a three-quarter-inch mark several times consecutively at twenty-five yards, *off shoulder*, is little easier than to make seven consecutive six inch circular bull's eyes at 200 yards, in clear weather."

Allow me in conclusion, not as a matter of boast, but as one of fact, to state that several years ago, I made sixty-two consecutive off-hand rifle shots, the total string measure of which from the break of the ball nearest the centre was twelve and five-sixteenths inches. Shots that demolished the centre point counted nothing. The targets were retained for a number of years but are now lost, or I would be pleased to send them to you. If any of your 800, 900 or 1,000 yard shooters have done better, or think they can do as well or better, I shall be pleased to hear from them through the columns of FOREST AND STREAM. A. M. S.

Sea and River Fishing.

FISH IN SEASON IN APRIL.

Salmon, *Salmo Salar*.
Trout, *Salmo fontinalis*.
Land-locked Salmon, *Salmo gairdneri*.

Salmon trout, *Salmo confluis*.
Shad, *Alosa*.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

—The weather is precarious for fly-fishing. During the past week local storms of sleet and snow have occurred in the mountain regions, and cutting blasts have swept the plains of Long Island, bringing a shudder at the mere thought of taking "a day's fishing." Normally the trout season opened on the 16th of March; to-day, a month later, rods and creels are still in "ordinary," as the sailors say, and we have scarcely heard of a string of fish being taken. Seth Green is perhaps the only person who has been in luck. Hear what Seth saith. Seth says:—

"There is no trout fishing within fifty miles of Rochester, except preserved streams. I fished in Caledonia Creek last Thursday, the stream that Mr. Collins' trout ponds are on, and caught six pounds of trout in three hours. There is more trout in that stream than in any stream of its length in the world."

—Adirondack lakes are still (April 13th) ice-bound, snow a foot deep, and thermometer thirteen degrees above zero. Our readers will be informed as soon as the streams open.

—We have received from Dr. J. R. Romeyn of Keeseville, a trout fly devised by Dr. Ely, of Adirondack fame, and named the Romeyn fly. It has a green body, with wings made from the mottled feathers of the wood duck. We shall try it for shad on a number four hook.

—Bass fishing was excellent on the Susquehanna last season between Dauphin and Clark's Ferry. Fish Commissioner Duffy is of the opinion that there will be an abundance of these fish in lower waters of the Juniata, this season. What appears singular in regard to these fish is, that in the vicinity of Peach Bottom, which is from fifty to sixty miles nearer the mouth of the river, a very few bass have been taken, the number not exceeding half a dozen within three years, and these were caught in seines and fish baskets.

—The subject of fly fishing for shad seems to increase in interest as the season for that almost untied pastime

approaches. As to the selection of suitable localities, all the directions that can be given in a general way are contained in the following notes from Prof Baird and Seth Green:

UNITED STATES COMMISSION, FISH AND FISHERIES.
WASHINGTON, April 6, 1874.

EDITOR FOREST AND STREAM:—

At present the theory in regard to the shad is, that instead of migrating up the coast from south to north in the spring and back again in the fall, they simply spend their oceanic life in the seas quite adjacent to the rivers where born, and return to them in the proper season.

I cannot give you the locations where the shad may be taken with the fly, as this has not been a subject of research with me. As a general rule you may safely assume that where fish are arrested in the rivers by rapids and impassable dams, there they can be taken to the best advantage in this manner. Very truly yours, SPENCER F. BAIRD, Commissioner.

Seth Green's experience and practical knowledge of the habits of the shad can add but little more information. He says, in reply to a private letter from this office:

"Shad can be taken with the fly in the different waters at the foot of any sharp running reefs by letting the line run out and swing down to where the water is comparatively still, and move it gently back and forth. The greatest trouble in all streams is to find the shad. They are not plenty enough in any waters except at Holyoke Dam.

On any other river you may fish an evening and not see a single shad. Before I hatched shad in the Connecticut River, you might have fished for shad several evenings without seeing one. I did the first shad hatching in the Connecticut River in the spring of 1867, and in the year 1870, the shad were more plenty than the oldest inhabitants had ever seen them. But Mr. Chalmers has described the way to take shad so much better than I can, that I will not say much about it. I took young shad eight inches long with a fly, at Holyoke, in the year 1867. I have never taken a full grown shad with a fly, but I have not the least doubt that I can, after reading Mr. Chalmers' letters. He is authority in these matters. Yours, SETH GREEN.

—The following inscription is attached to an imperial photograph at Andrew Clerk's, representing an angler in full regalia, with a fish nearly as large as himself hung suspended beside him, so as to exhibit their relative proportions:—

"A bass weighing 75 lbs., caught by Wm. B. Post, Esq., at Newport, Rhode Island, August, 1873, he standing on the shore, and with the rod and line shown in the picture."

The capture of this fish by rod and line was a remarkable feat. Scarcely less creditable was the capture by Mr. Cooke Evans in Serpent Lake, Minnesota, last fall, of a muscalonge that weighed 17 pounds and a half and measured a yard and a half long, with an eight ounce split bamboo rod.

—As to the angling in Maine, the northern and western parts of the State are "full of it." Mount Desert, of late a favorite seaside resort, combines more trout and salt water fishing within a smaller radius than any other resort that we know of. We have taken pound trout from Eagle Lake, only about two and a half miles from the ocean. It is beautifully situated up among the Mount Desert hills, and is well worthy a visit. There are lots of small lakes in Hancock county where trout may be taken, but they usually run quite small, from one quarter to half a pound. Moosehead, the Umbagog Chain, Grand Lake, and the country lying about them are the localities after all for the experienced angler, and we very much doubt if their superiors can be found out of Maine. As to the Umbagog lakes, we prefer the Andover route to the Upper Dam. Leaving Portland at two P. M., by Grand Trunk road, you arrive at Bryant's Pond at four o'clock, where a stage takes one to Andover, a distance of twenty miles, stopping at Rumford, half way, for supper. Stop at Gregg's, who keeps an excellent house, and who will provide guides and take you to the lake, twelve miles, on a buck-board. If you have a fair wind you will reach the camp at Upper Dam in season for the evening fishing.

—A pleasant summer resort on Long Island is thus described by H. C., a frequent correspondent:

SAG HARBOR, L. I., March 26, 1874.

EDITOR FOREST AND STREAM:—

Last Tuesday I took the 3:15 P. M. train from Hunter's Point and arrived at Sag Harbor at 8:15, after a tolerably pleasant and certainly safe ride of 102 miles on the Long Island Railroad, the fare being \$2.70. Next morning I accompanied the genial Mr. Barker, the Noyac miller, to his trout preserve at the head of the waters which supply his mill-pond, and I was well pleased to see the success of his experiments in raising trout so strikingly illustrated. The arrangements of the preserve are simple but very ingenious and effectual. A fine cold and never-failing spring of water is utilized to supply a gentle flowing stream which, forced through three or four sieves, runs over beds of fine sand contained in a covered box of about fifteen feet in length by a foot in depth. On these beds are laid the trout eggs, and on opening the box I saw the water gently flowing over the beds, on which were hundreds of diminutive trout swimming about, looking like half-inch pieces of black thread. Next to the spawning trough lay a longer and wide trough, covered with laths, through the openings of which could be seen hundreds of trout of a year's growth, the water running over their beds about four inches in depth. The laths are requisite to keep off the kingfishers and other birds, which would otherwise feed on the young trout. Further on the creek itself is allowed to run, unobstructed by any troughs. This part of the stream is arranged so as to have places under the embankments for the trout to hide in. It is not over a foot deep and about fifty feet long. In it there were some sixty fine trout gathered, sunning themselves, but they soon vanished from sight. Next season Mr. Barker proposes drawing off the water from his mill-pond and clearing out the eels and perch it contains, supply it with trout, which originally existed in the brook forming the pond. It is just the locality for a trout pond, having a depth or some twenty odd feet in some places, while it is nearly surrounded by woods, and charmingly located as a summer resort. Mr. Sampson's farm adjoins the pond on the southeasterly side, and he has a spare room for a couple of boarders during the summer months. There is good perch fishing in the mill-pond, and occasionally one may get hold of a trout, but they are scarce. Permission from Mr. Barker is required to fish in the pond, which he readily gives. Noyac is a cultivated strip of land running along the southerly shore of Little Peconic Bay from Sag Harbor to North Sea. The Harbor once had 6,000 inhabitants and over, but now has scarcely 2,000, and in Noyac there are but three of the old residents left, viz.: the Pearsons, the Edwards, and the Eldridges. Once upon a time the waters of the shores of Noyac were full of game fish, but what, with seines, nets and "pounds" they have all been driven away, and though the locality used to abound in bass, not a fish is now to be caught there. Off Jessup's Neck—a strip of land covered with cedar brush and full of nests of musquitoes—there is excellent bluefishing to be had in season, and in the bay scollops abound, as also excellent

hard and soft clams. There are a few porcees to be had in the bay and kingfish occasionally. Back of the cultivated strip there are the woods, which extend back some four miles towards Bridgehampton, and in the watered portion woodcock shooting is good in season. In the fall excellent wild fowl shooting is to be had in the bay, and for purposes of a family sojourn in summer to parties liking a very retired and out-of-the-way country place, Noyac presents an attractive locality. H. C.

—An attentive Florida correspondent sends the following note:—

[It will be perceived that he speaks of black bass (*Gryles sulmoides*) of the surprising weight of 21 lbs., which is something unheard of by us, and is a fact well worth making a note of for future reference.—ED.]

NEW SMYRNA, E. FLORIDA,
March 31, 1874.

EDITOR FOREST AND STREAM:—

Yours of the 19th came to hand last night—a letter is as long coming here from New York as it takes to go to England. I am preparing for Professor Baird a statement of the spawning periods of the sea-fish of this coast, with other particulars, and I will give you an abstract of it. I get it from the native fishermen.

As to the list of sportsmen in Florida, few come to this place; the house is now empty. Enterprise, Palatka and Sand Point are the chief rendezvous of our craft in this region. I can report as having been here lately, E. G. Pendleton, Virginia; F. B. Tucker, W. L. Fairbrother, Chicago; E. U. Wright, W. W. Fisher, Lindley Johnson, Philadelphia; George M. Downes, John Halk, Rutherford Stuyvesant and wife, New York; T. J. Pierpont, J. F. Masters and wife, Henry Shipman, Brooklyn; Wm. S. Peele, Boston, most of them belonging to the hunter or fisher folk.

Sheepshead fishing is over, as they are now spawning. Bass or redfish, salt water trout, kingfish and pigfish are our principle game now, some groupers and snappers, which, from their rarity, are much prized. The arge fish are beginning to be troublesome, the sharks, rays and sawfish, which carry away so many hooks that I fear I shall be destitute before I leave. We have now many catfish in the river; two kinds, one much resembling the fresh water cat of the clear lakes weighing, say 2 to 3 lbs. The other a larger kind, from 4 lbs. to 16 lbs. with very long dorsal and pectoral fins, armed with sharp spears. They have eggs in them as large as cherries, and the fishermen say they are viviparous, like the rays and sharks. I think it is *Galeichthys marinus* (Cuvier.) The drum will soon be in season, and then we shall have a new sensation, they being very large heavy fish from 10 lbs. to 50 lbs.

There is a fresh water stream not far off, Spruce Creek, which is said to abound in large trout, black bass. I have heard of two being killed there this spring which weighed respectively 19 lbs. and 21 lbs. I shall try to visit this stream and if so will report to you. Very truly yours,
SAMUEL C. CLARKE.

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

HIGH WATER, FOR THE WEEK.

—Mr. John F. Munn has recently launched from his yard, at the foot of Court street, Brooklyn, a singular looking yacht, designed by her owner, Mr. J. W. Holmes. She is intended for a cruising vessel, we believe, but how successful she will be even in that way is a question involved in considerable doubt. That the idea of speed in connection with this vessel never entered the designer's brain we can readily conceive. Her dimensions are as follows:—Length on load water line, 36 feet; length over all, 40 feet; beam, 16 feet; draft of water aft, 3 feet 6 inches; forward, 2 feet 6 inches; length of centre board, 13 feet. Her depth of hold and freeboard we did not ascertain accurately, and dare not hazard a guess, for they are simply incredible. Neither her entrance or her delivery is particularly fine, as may well be imagined when we remember that her length on the load water line is 36 feet, and that her beam is 16 feet, and placed only a few inches above this water line. Her sides are straight, and their height out of water forward is enormous. The house extends clear across the deck, and is flush with the rail. At the forward end there is a row of dead lights, showing that ventilation at all events has not been neglected. Aft the house the entire boat is cock pit. But more singular than the hull itself, when we consider the purposes for which we understand the yacht is intended, is the rig adopted. Why any one should step a mast 65 feet in length in the eyes of a boat of this size, and condense his canvas into mainsail and topsail for prospective cruises to the West Indies, passes all understanding. Her boom is to be 42 feet long, and gaff the same length, though we understand the head of the mainsail only hauls out to within twelve feet of the end of the gaff, leaving that amount of pole to aid in spreading a peculiar kind of sail, which above the gaff has the appearance of a club topsail, and below that spar officiates as a species of ring tail.

—Mr. Dickerson's keel sloop the "Psyche," which our readers will remember touched bottom near Rockaway last fall, is at Mr. Steer's yard for repairs. As yet, nothing but internal work has been commenced, but that more than this must be done before she is launched again is evident, for she is at present without a keel, without garboard strakes, and without various other planks, all of great utility, as they will come below her water line.

—Mr. Steers has also in his yard the sloop yacht "Gusie." This vessel, we believe, he built for his own use, originally, but she has been much changed since then. During the past winter she has been raised about ten inches, keeping the same sheer as before.

—Mr. Rutherford Stuyvesant is making very extensive alterations in his yacht, the Palmer, which will unquestionably improve her heavy weather qualities, though it is doubtful whether her speed over the New York Yacht Club

course will be increased. She is at the yard of Mr. Henry Steers, under whose supervision the changes are being made, and when she leaves there very few of her old friends will recognize her with a flush deck fore and aft, great increase of freeboard, and with much diminished sheer. Her top sides will be raised forward from five to six inches, in the waist twenty-two inches, and at the stern fourteen inches, and she will have light bulwarks about two feet in height. We imagine that she will require considerable more ballast than formerly to counteract the influence of the additional weight, all of which will be above the water line. As the old masts are to be used, the area of her lower sails will probably be reduced in order to get the saddles at the proper distance above the new deck.

—Rear Commodore S. B. Colgate, of the Seawanahaka Yacht Club, has his schooner, the Idler, at Mr. Henry Steer's yard, where she has been recaulked and thoroughly overhauled. There have been no alterations in the hull, but her masts have been taken out, and will be changed by shifting the position of the hounds about three feet lower down. This will of course shorten the luffs of the fore and mainsails, but by the use of longer gaffs, and peaking up the heads of the sails at a greater angle, the loss in area will be more than counterbalanced by the improvement in shape. With topsails set, there will be no reduction in canvas, for the tacks of the topsails will fill in the corners taken out at the throats of the lower sails. Indeed, with the end of the Idler's main boom twenty-six feet over the stern, and head gear to match, it does not seem a matter of vital importance if there had been a loss of a few feet in sail area.

—A large number of gentlemen have been cruising this season upon the St. John River, Florida, in small yachts and sail boats. Several of these craft were arranged with every combination of comfort, without being too large to follow the tributaries of that river to their remote sources. Those who thus reach the points far from the main water routes are rewarded by seeing abundant game, and gain the chances of shooting and fishing beyond the ground overrun by the multitude. The amount of animal life on and near the St. John has been greatly diminished. Shooting from boats, and constant hunting by professionals, who get good prices from the steamboats for venison, and from travellers for plumage birds, has rendered the game birds and animals very scarce and shy. James H. Peabody, Esq., of Philadelphia, has his steam yacht Falcon on the river. She is well arranged for the service, and combines all the qualities proved desirable by a long experience in hunting here, and no more delightful life can be imagined than cruising with her, manned as she is by an excellent crew. The number of tourists going up the Ocklawaha has been very large. Colonel Hart has a new boat upon the route, but could not carry all who wished to see the romantic river and wonderful spring, so he is about laying the keels for two more boats of the peculiarly strong form that alone can endure the hard knocks they get from cypress knees and oak boughs.

—A meeting of the Lynn Yacht Club was held at their club house in Lynn, Massachusetts, Tuesday evening last, when it was decided to hold their usual regatta on the 17th of June.

DORCHESTER YACHT CLUB.—It was our intention to have published in this issue an authentic list of the yachts, owners, etc., belonging to this club, but we are informed that at the annual meeting of the club a change was made in the rule for measuring yachts. Under the new rule the length of all boats will be increased from about three inches for the smaller boats to about six inches for the larger ones. The boats are measured while in the water, and as there are not more than three now in commission it would be impossible to give correct figures, which we hope to do in May. The yacht Bessie has been purchased by W. Whitney Lewis, Esq., the measurer of the club, of her late owner, W. F. Whitney. George F. Clarke, Esq., has disposed of the yacht Merlin to S. S. Gray, Esq., of the Beverly Yacht Club, but still retains the cutter Saxon. The Merlin has left the club. Edward Burgess has sold the Friedly to George H. Balch, who has entered her in the Dorchester, Beverly, and Boston yacht clubs.

BOSTON YACHT CLUB.—The sloop yacht Owl has been purchased of Mr. Cunningham by J. E. McCreary, of Philadelphia, where she will probably be taken. She is now at her moorings off the Club House. The schooner yacht Rebecca, owned by J. H. Reed, has recently been added to the club roll. We published last week a list of the yachts of this club, into which several errors inadvertently crept. We shall, before the season opens, publish a carefully revised list.

SOUTH BOSTON YACHT CLUB.—This club gave their last social party of the season on Easter Monday evening. Their club house at City Point was gaily decorated with flags and yacht signals for the occasion, and a large number of the members with their ladies participated in the festivities. Under the influence of their new commodore, J. N. Roberts, Esq., and his associate officers, the members are uncommonly active in promoting the success and welfare of the organization. At the last regular meeting the steward, Mr. Winett, presented the commodore, in the name of the club, a complete set of colors and signals for his use. Improvements are to be made on and around the club house, which will make it every way desirable for the purposes intended. Yacht owners are now busily engaged in putting their boats in condition and making such alterations as past experience and future needs have suggested.

Following is a correct list of the yachts belonging to this organization, compiled from the latest information:—

Name.	Owner.	Water Line.	Keel or Centre Board.
STEAMER.			
Starry Banner.....	Thomas Taylor.....	61	Keel.
SCHOONERS.			
Banshee.....	W. J. Orcutt.....	23.5	Keel.
Carrier Dove.....	T. Barker.....	31.5	Keel.
Leslie.....	S. W. Bailey.....	21	Keel.
Hattie.....	T. Christian.....	26.1	Keel.
Haze.....	J. B. Moody.....	22	Keel.
Kittie.....	J. M. Ward.....	31	Keel.
Mercury.....	J. N. Roberts.....	33	Keel.
Ranger.....	T. R. Miller.....	31.4	Keel.
Wanderer.....	W. Nelson.....	25	Keel.
SLOOPS.			
Annie.....	P. McKenna.....	28	Keel.
Bessie.....	F. A. Taylor.....	17	Keel.
Columbia.....	R. W. Bibber.....	19.10	C. B.
Clyde.....	T. Lutted.....	23	Keel.
Cycla.....	H. R. Smith.....	24.6	C. B.
Clytie.....	J. N. Roberts.....	18	C. B.
Fannie.....	Benjamin Dean.....	21.6	C. B.
Fearless.....	J. A. Woodward.....	20	Keel.
Fly.....	W. B. Alexander.....	16	Keel.
Gracie.....	J. M. Learned.....	24	Keel.
Hope.....	M. S. Dix.....	16	Keel.
Kate.....	C. T. Haley.....	20	Keel.
Kelpie.....	S. J. Capen.....	28	C. B.
May.....	W. Gorman.....	18	C. B.
Maud.....	C. E. Fuller.....	18	C. B.
Mabel.....	J. N. Roberts.....	19.2	C. B.
Nellie.....	Walter Reed.....	23	Keel.
Naiad Queen.....	W. Kilner.....	26.1	C. B.
Posey.....	H. J. McKee.....	24	C. B.
Petrel.....	M. F. Murphy.....	18.6	C. B.
Puzzle.....	G. A. Wheeler.....	22.3	Keel.
Queen Mab.....	M. J. Kiley.....	21.0	C. B.
Ripple.....	C. D. Macomber.....	22.1	C. B.
Rover.....	J. H. Stark.....	22	C. B.
Starlight.....	F. S. Wright.....	35.6	Keel.
Starlic.....	A. T. Plummer.....	20	C. B.
Uncle Moses.....	C. H. Dolbeare.....	21	Keel.
Unique.....	J. Stewart.....	20	C. B.

There are 130 members on the rolls. Their first regatta will take place in June, and doubtless others will be held during the season.

EDITOR FOREST AND STREAM:—

The annual meeting of the Argonaut Boating Club of Toronto, Canada, was held at the Rossin House, in that city, on the 4th inst., when the following officers were elected for the year 1874-5: President, Mr. H. O'Brien; Vice President, Mr. Spragge; Captain, Mr. Roger Lambe; Treasurer, Mr. George Tizard; Secretary, Mr. Walter H. Newbery; Executive Committee, Messrs. J. F. Smith, John Martland, T. W. Fisher, C. E. Ryesson, James E. Ellis, Rusk Harris and Harrold Lambe. This association is in a very flourishing condition, numbering some one hundred and fifty members, and with a fleet of eleven racing and practice boats. The club lately erected, at a cost of over five thousand dollars, a very commodious and pretty boathouse on the Esplanade fronting the bay.
WALTER R. NEUSEY, Honl. Sec'y.

—The Halifax Boating Club will, if Mr. Brown is willing to row—as there is little doubt he will be—accept the challenges of both Coulter and Scharff, and undertake the management of the races on his behalf. James Ten Eyck, who was challenged by Scharff at the same time as Brown, has accepted the challenge. William Scharff, of Pittsburg, Pennsylvania, a member of the McKee boat club of Pittsburg, and George Brown, of Halifax, Nova Scotia, are arranging a race for the championship of America and a large sum of money.

—The St. Augustine, Florida, Yacht Club, has elected the following officers for the ensuing year: Commodore Gordon Granger, Esq.; Vice Commodore, Daniel Egar, Esq.; Secretary and Treasurer, R. F. Armstrong, Esq.; Measurer, Charles F. Crary, Esq.; House Committee, W. H. Robinson, Esq., of Florida, J. M. Morton of New York. It is to be legally incorporated.

COLUMBIA COLLEGE, April 13th, 1874.

EDITOR FOREST AND STREAM:—

Although our crew has not been definitely decided upon, the following will most likely be the men selected, and the positions in which they will row:—G. C. Kobbe, '74, bow; Simpson, School of Mines, or G. Griswold, '77, 2; Wells, School of Mines, 3; E. Rapallo, '74, 4; R. C. Cornell, '74, 5; B. F. Rees, School of Mines, stroke. Rees, Cornell, and Rapallo hold over from last year's crew. Simpson and Wells have had some previous experience in rowing, while Kobbe and Griswold are new men, and the latter is also rather young. You will see that our material is of the best, and if we do not turn out a good crew it will not be for the want of men. Fearon, of Yonkers, has been building us an addition to the college fleet, and hard work will soon be begun at Harlem. Our quarters at Saratoga have been selected, and the crew will arrive at the lake early in June, so as to have at least a month's practice on the course. There is some talk of adopting the English stroke this season, and two graduates of Cambridge—old Columbia students also—have offered to train the crew if it should be thought best to adopt it, but the probabilities are that the change will not be made until one more trial has shown whether the same stroke that put us fourth last year cannot bring us in ahead. I will write again in a few days, or as soon as Captain Rees selects his men. Yours, W. A.

PORTLAND, ME., April 9, 1874.

EDITOR FOREST AND STREAM:—

The annual meeting and supper of the Orient Boat Club took place at the Preble House on the evening of the 6th instant. The following officers were chosen:—President, H. P. Ladd; Vice President, E. Dennis; Secretary, C. M. Henry; Treasurer, G. D. Loring. Regatta Committee, H. P. Ladd, C. M. Henry, J. Frazier. The boathouses occupied by the Emerald Club and the noted Longshore crew are to be torn down to make way for wharf improvements. It is expected that O'Brien of the famous McLaren crew, of St. John, will occupy the seat of Conwell, the stroke oar of the Longshoremens the coming season. A second match between the rival brushmaking scullers, Frazier of this city and Lane of Boston, is already talked of, and will probably be arranged in a few weeks. Mr. Henry, of the Orient, offers to row anybody in this vicinity for \$100 aside, and a response from Davis, of the Emeralds, (the present State champion,) is looked for.

—A page of yachting and boating matter is unavoidably deferred.

DETAILS OF THE OXFORD AND CAMBRIDGE BOAT RACE.

—Our regular English files being late this week, in order to keep our readers thoroughly posted on all important boating matters both at home and abroad, we publish a portion of a cleverly written letter from the New York *Herald's* correspondent in London on this important race:—

"Exactly at eleven o'clock the Oxford crew cleared away from the Leander boat house and dropped down to the starting barge. Both boats started almost simultaneously, but it seemed to me that Oxford delayed a little. For the first quarter of a mile they rowed singularly even; then Cambridge began to draw a little ahead, increasing almost unobservedly, bit by bit, until passing the Whitestone lodge, on the Middlesex side, which marks the first mile, they had gained a boat's length, and one of the knowing ones, standing near me, dropped his glass and said, 'The race is over.' Not so, however. Just at Hammersmith Bridge the Oxonians put on a spurt, which, finding successful, they continued, and now the real interest of the race began. The Cantabs got to work too, but could not shake off their opponents, who held to them with grim tenacity. The shouts of 'Well rowed, Oxford,' from the densely lined banks became universal, and it really looked as though fortune were once more going to favor the dark blue. The bow oar of the Oxford boat is seen to be rolling his head in a very strange manner, but it is declared to be 'his way,' and the coxswain is certainly steering a very devious course, but the whole crew is doing so well that just entering Carney Reach they collar their opponents. The wind has been careering about the Reach, apparently, and has left the water lumpy—a state of things which the Cantabs, who are running in their Waite boat, are supposed to specially object to. Here is Oxford's greatest chance, and certainly while in the Reach she had got her boat's nose half a length beyond her antagonist. Short-lived joy for the dark blue supporters. Barnes Bridge is in sight, and the coxswain of the Cantabs calls upon his men, whose superior training has kept them comparatively fresh, while the Oxonians are manifestly spent. Once more they try a spurt, but in vain. The Cantabs draw relentlessly ahead, and the Oxfords know they are beaten, but pull on pluckily to the last. When the gun fires announcing the Cantabs' arrival at the goal their rivals are three lengths behind them. This was an admirable and closely contested race throughout—not over quick, for the four and a half miles were rowed in 22 min. 38 sec.; but it must be remembered that the tide was slack and the wind contrary. The average pace was—Cambridge, 38 strokes per minute; Oxford, 37. Both crews rowed well. Both crews seemed dreadfully punished by the performance. Mr. Rhodes, the Cambridge stroke, leant over the side of his boat as though about to vomit, then rested his head on his arms unable to respond to the cheering. The Oxford stroke's plight was not much better, and the men in both boats looked thoroughly pumped out."

Rational Pastimes.

Will our University correspondents kindly send us their most recent catalogues.

—We have in type a very instructive and readable article upon cricket by A. A. Outerbridge, the celebrated cricketer of Philadelphia, which is unavoidably deferred till next week. Correspondents in all departments must bear patiently with us; the material furnished us is too good to throw into the waste basket, and will appear in due time and season.—[Ed.]

The Staten Island Cricket and Base Ball Club held their annual meeting at Wimers Hotel, Tompkinsville, Staten Island, last week when the following officers were elected for 1874:—W. Butler Duncan, President; W. H. Clark, Vice President; Nathaniel Marsh, Secretary; Walter M. Betts, Treasurer. The Board of Directors elected to serve this year were M. M. Rogers, A. E. Outerbridge, George S. Scofield, Jr.; John B. Duer, and W. B. McKean. The club have engaged this year Mr. A. Carpenter, from Boston, as their professional cricketer, and the eleven will be selected from the following players:—Jones, Duer, Outerbridge, Luske, Robinson, Davis, Filmer, J. Lee, Adams, Harvey, Marsh, Sprague and others. The base ball nine will present Beaven, Sprague, Clyne, Jackson, Lemist, Hitchcock, Betts, Armstrong, Mort, Rogers, &c. The club numbers 130 members, and will play on their grounds, fronting on New York Bay, at Camp Washington, Staten Island. The season will commence on Saturday, April 18th.

—The cricket nine of Germantown engaged to play base ball this season is as follows:—Sharp, catcher, McTighe, pitcher; Fox, first base; Van Rensselaer, second base; Rob. Newhall, third base; Dan. Newhall, short stop; Pease, left field; Dixon, centre field; Tiers, right field.

—This afternoon the first great championship game of the season will be played at Twenty-fifth and Jefferson streets, the contestants being the rival professional nines of this city—the Athletics and Philadelphias. Much interest is attached to this first meeting on account of both clubs presenting somewhat stronger nines, and each being in fine trim. The Athletic nine will be as follows:—McBride, pitcher; McHeary, catcher; Fisler, Battin, and Anson on the bases; Sutton, short stop, with Gedney, Mc Mullin and Clapp in the out-field. The above are a very strong nine individually, but whether they could not be better positioned in the field is a problem which to-day, doubtless, will alone decide. The Philadelphias will play the following exceedingly strong nine:—Cummings, pitcher; Hicks, catcher; Mack, Radcliff and Holdsworth on the bases; Fulmer, short stop; with York, Egler and Bechtel in the out-field. Both nines are very evenly matched, and a sharp contest will be sure to ensue.

—Charles H. Mills, the brother of Andrew Mills, of the Old England Club of Brooklyn and well known in the base ball fraternity as a free player and an impartial umpire died

at his residence in North Second street, Brooklyn, E. D., on April 10th, of consumption, brought on by a neglected cold contracted while standing as umpire.

—The Arlingtons opened play on the Capitoline Grounds on April 13th, and showed some fine fielding, their catcher especially. They will play there every Monday this season.

—The members of the gymnasium of the Young Men's Christian Association, Twenty-eighth street, held an athletic entertainment last week. Most of the competitors were gentlemen amateurs. Prof. J. Wood and J. W. Taylor engaged in the manly art with gloves; then came C. H. Cone and Charles Coombes, the former a noted swimmer and pedestrian. The American style of wrestling was shown by John H. Malory and P. H. Lawlor, which elicited loud applause from the amateur athletics. C. D. Newton, a graceful gymnast, performed a series of difficult feats on a single trapeze, which were well received. Prof. Long's pupils showed some good performances with the gloves. Profs. Sinac and Silcasa next displayed their talent with foils, both proving themselves masters of the art. Col. Monstrey and H. Johnston went through the broad-sword exercise. The numerous dexterous passes were more or less brilliant, all being warmly acknowledged. Profs. Sinac and Silcasa then gave an exhibition of the French mode of boxing, which was novel and entertaining, as the contestants use their feet. This created considerable enthusiasm, and the Frenchmen retired amid ringing applause. The final event was a glove contest between Prof. O'Neill and Prof. Long. Throughout the entertainment the best order prevailed.

—The new professional nine of Baltimore opened play on a practice game on April 11th, when they had a strong field nine opposed to them with young Stratton as pitcher. The professional nine, included Snyder as catcher, Brainard as pitcher, Gould, Sellman and White on the bases, Kohler short stop and Ryan, Deane and Bulask on the out field. Deane is the new Captain of the team, Sweasy is to play second base and Sellman at short field. The contest was close and the play excellent. The score stood at nine to four in favor of the Baltimores.

—The Hartfords played their first regular match game on April 11th, when they had the Trinity College Club as their adversaries, assisted by Bernie as catcher. The game was finely contested up to the close of the fifth innings, at which time the score stood at three to two only, and the professionals slightly anxious. In the sixth innings, however, the Hartfords got on heavy at the bat and finally won by a score of nineteen to two. Ram stopped play at the close of the seventh innings.

—The following is the record of professional games to April 14th:—

March 2.	Profess. vs. Amateurs at Philadelphia	23—14
21.	Phila. vs. Field Ten at "	12—8
28.	Athletic vs. Field Nine at "	16—3
30.	Athletic vs. Modoc "	27—4
30.	Atlantic vs. Field Ten at Brooklyn	16—6
April 2.	Atlantic vs. Field Nine at "	9—8
2.	Boston vs. Field Nine at Boston	10—8
2.	Athletic vs. Pacific at Philadelphia	33—5
4.	Mutual Ten vs. Field Ten at Brooklyn	19—4
4.	Athletic vs. Riverton at Riverton, N. J.	20—7
6.	Philadelphia vs. Modocs at Philadelphia	25—0
8.	Atlantic vs. Davis Ten at Brooklyn	20—3
8.	Hartford vs. Field Ten	28—6
8.	Athletic vs. Shibe	25—2
11.	Hartford vs. Trinity College at Phila	19—2
11.	Athletic vs. Zephyr at Philadelphia	45—0
11.	Philadelphia vs. Allentown at Allentown	46—8
11.	Atlantic vs. Concord at Brooklyn	14—2

—The Hartford and Yale nines will play a game of ball at Hartford, April 18, and another at New Haven, April 26.

—Four colleges—Harvard, Yale, Amherst, and Bowdoin—responded to the call of Harvard for a convention on the 4th instant, at Springfield, Massachusetts, to arrange for a freshman base ball tournament. The convention was unanimously in favor of a tournament, and voted to hold it on the Union grounds, Boston. The date was not fixed upon, but it will probably be the last week in June. The tournament will be for the freshman championship of the country.

—"Boiled Eggs" is the name adopted by the new Danbury Base Ball Club, to signify how impossible it is to beat them.

PRINCETON, N. J., April 1874.

EDITOR FOREST AND STREAM:—

During the past three or four months the pulsations of Princeton's athletes have been very infrequent, and apparently the life of out-door pastimes seemed almost to have become a dead letter. Foot-ball has alone been worshipped at its shrine by its devotees. Truly the gymnasium never presented such an animated appearance as it has during the past winter. There you see the men aspiring to a seat in the University boat race next summer pulling the rowing weights at the rate of 42 strokes a minute, and yet anxious to know how fast they were going, but alas! they shot past tree and every mile stone at such a speed that no opportunity was afforded them for calculating the rate; and after pulling for half an hour, you see them jump up and look so "glad to find they were where they started," and all without turning once. In the middle of the gymnasium you perceive a small party lustily swinging clubs under the guidance of another, whom, upon inquiry, proved to be the captain of the University Base-ball nine, and the men were his willing vassals. Again, as you glance around, you cannot fail to discover "the Hercules" putting up the 110 pound dumb bell two or three times, the gentleman gym-

nast exercising only so much as to develop his fine (?) shoulders and chest, and give him a more manly appearance; then the real gymnast is easily recognized by the ease and grace of his every action and the swelling of his muscles as he accomplishes each difficult performance; besides, numerous aspirants to broad shoulders, full chest, large arm, &c. may be seen looking eagerly from the 300 to the 110 pound dumb bell, and wishing that they could raise the *former*. Nevertheless, as we compare the *physique* of the men who now appear upon the field and water with their appearance last November, we cannot but see and acknowledge that the four months of comparative lethargy has truly been productive of much good. As the earth exchanged her garb of snow and mournful strains of the cheerless wind for a mantle of pleasing verdure and cheerful chirping of the birds; as all nature awoke as from a trance, so the latent forces and desire for out-door sports were permitted to break their bonds, and the devotees of athletic sports, each in his own sphere, surpassed in number and zeal those of any former year. The nature of pastimes in Princeton is not a little varied, hence I will just give a cursory account of each department separately.

BOATING.

Though this is as yet in its infancy, it promises to develop into a large and powerful manhood. Many men have been striving to *earn* a position upon the crew, and at first 36 men went into active training. Since then the number has been reduced to 18, who have been upon the water several times, and from whom the crew will be chosen at the opening of the next term. A new boat house is in progress of erection, and will soon be completed. It is situated on the south bank of the canal, about a mile from the college, and will be 76 feet long and 40 feet wide. The Freshmen are actively employed in working up a crew, and Princeton hopes to be well represented at the coming regatta. Quarters have been selected upon Saratoga Lake, and the 16th of July is eagerly anticipated by all.

BASE BALL.

Never has the season opened more auspiciously, in many respects, for the success of the University nine. The men have been in the gymnasium exercising and practising throwing, and the benefit so derived has been prominently manifested. A good pitcher seems to be the only deficiency, and when that is obviated the chances of success will be vastly increased. Friday, the 3d, a practice game was played between the University nine and a ten selected from the college, resulting in the defeat of the college ten. A very high wind prevailed, which in part accounts for the low score, which was as follows:—

University—3, 0, 1, 0, 0 2—6.

College—0, 0, 0, 0, 0, 0—0.

The Secretary's address is A. C. Crawford, Princeton, N. J., and all prominent amateur clubs would like to be heard from, especially the Chelsea, Staten Island, Nassau, and Nameless clubs, as well as Harvard and Yale College nines.

PEDESTRIANISM.

Several men have developed quite a fondness for this healthful and innocent recreation. Among the various trips they have made we would mention those of two men. Saturday, March 28th, they started for Trenton, a distance of 10 miles. The first five miles they walked in 45 minutes, the whole distance in one hour 50 minutes. Saturday, April 4, they walked to New Brunswick, 18 miles distant, in 3 hours and 40 minutes. Frequently excursions of from 5 to 10 miles are made into the country and return.

CALEDONIAN GAMES.

Men may be seen constantly practising jumping, standing and running, putting the stone, and throwing the hammer. From present indications we can prophesy a large number of contestants and a fine display of the muscular.

As time rolls on opportunities will be offered for future contributions, and until then you may consider athletic sports at Princeton not dead, but in untiring efforts for perfection.

CHAMPION.

—Since the match for the championship between Messrs. Garnier and Daly, business has been very good at the leading billiard rooms. Every contest between our leading experts seems to give a fresh impetus to the noble game, and sets the devotees of "Billiardiana" to hard work practising the shots, &c., they see in Tammany Hall.

—The improvement in business at the Spingler House rooms is very satisfactory. Under Mr. Dndley Kavanagh's management the business has nearly doubled. Mr. Maurice Daly may be found here every day practising for contests ahead.

—The 15-ball pool game at the Spingler Rooms is lively. Thursday evening last there was a long contest between some of the best players in the city, during which the 15 balls were pocketed by two of the players in one inning each. The man holding the highest ball had a poor show.

—Mr. Cyrille Dion has issued a challenge to play Maurice Daly a match at French caroms, 600 points up, for \$1,000 a side. Daly is willing to play the match as proposed, but would prefer a larger stake, so we can look for another first-class contest in a short time. The game will be played within thirty days from the time the match is made.

—William Saxton, of P. Braisted's room, Fourth avenue, in playing a four-ball game the other night, made a run of 672 points, and an average of 130. If this young player continues to improve as of late, he will soon rank with the best.

—It is rumored that champion Garnier intends to visit California on a professional tour in a short time.

PRIZE LIST.

FOREST AND STREAM

A Weekly Journal,

DEVOTED TO

Out-Door Sports

Hunting, Fishing, Yachting, Boating, Practical Natural History, Fish Culture, &c. &c.

It is the OFFICIAL ORGAN of the

FOREST HOUSE, AT STARK'S FALLS, FOOT of the Bog. O. J. Pelsue, Proprietor. Boats and experienced guides furnished to sporting parties at reasonable rates. P. O. address, Colton, St. Lawrence Co., N. Y.

PAMRAPO HAS THE LOVELIEST

sites, and the most charming surroundings of any suburb near New York. Situated facing the Bay of New York and the Narrows, the views of marine scenery are absolutely enchanting. Here is ever a changing panorama of passing vessels, life and activity sparkle upon the waters, bay and sky blend the beauty of their gorgeous painting, such as not even an Italian lake scene can surpass.

HEALTH—The death rate is only 12 in 1,000; in New York and Brooklyn nearly treble.

WEALTH—All the principal railroads south and west terminate at Jersey City—the Erie, Penn. Central, Midland, Central New Jersey, the New National, and West Side. Taxes are only half the rate for New York or Brooklyn, and are so low that property will double every few years for twenty years to come. Here is the proof: The rate of increase in New York is less than two per cent.; Brooklyn, nearly five per cent. while the rate of Hudson County is nearly fifteen per cent.

With these advantages, it is only natural that this section should offer the greatest inducements to investors, both large and small. So come and select your sites, and build your house, or buy a house on installments, \$10 monthly, only from desirable parties taken, and after a few hundred dollars are paid lot buyers are loaned money for building purposes. Call on owner, C. E. HOE, 65 Wall, 4 Pine streets, or Pamrapo, N. J., which place is only 25 minutes from foot Liberty street, N. Y.; fare in all but 7 cents commutation.

TROUT FISHING IN THE PENNSYLVANIA Mountains good. Send for circular. A. MAGINNIS, Forks P. O., Monroe County, Pa. It

A SPORTSMAN'S HOME FOR SALE—WITHIN an hour's ride of the City of Philadelphia, an excellent Farm of 164 acres, 2 fine stone dwelling houses, 2 stone barns, with necessary outbuildings. Beautifully situated, and in every particular a very desirable property, especially to those fond of field sports. Stuffed grouse (pheasant), quail, hares, squirrels and foxes abound. A fine stream runs through the property. Price \$8,000. Will be sold on very easy terms. Address XXX, Forest and Stream Office, 103 Fulton street, New York.

VIENNA, AUSTRIA, NOV. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

Sirs—A friend of mine sent me, with a transport of Indian Skulls, two pounds "Vanity Fair," which I declare to be the best Tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair" is the King of all, by its aromatic flavor and the right sort of strength. My friend in New York got an appointment in California, by that reason I apply immediately to you, begging you to send me for the enclosed ten dollars, a supply of "Vanity Fair," and send with the next steamer to Germany. If there is a German firm that sells your excellent "Vanity Fair," I beg you to enclose me the address.

GOODS SENT BY EXPRESS, C. O. D.
Apr 16 PECK & SNYDER, 126 Nassau St. N. Y.

This arm was submitted in competition with over one hundred different systems, American and Euro- pean, to the Board of United States Officers, appoint- ed by Act of Congress, 6th June, 1872, for the pur- pose of selecting the best arm for the service, and of which Brig. Gen. A. H. Terry was President. It suc- cessfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for the military service by all nations is only a question of time; that whoever an arm shall be devised which shall be as effective as a single breech-loader, as the best of the existing breech-loading arms, and shall at the same time possess a safe and easily manipu- lated magazine, every consideration of public policy will require its adoption.

Resolved, further, That the experiments before the Board with the Ward-Burton Magazine System have so impressed the Board with the merits of this gun, that they consider it as more nearly fulfilling the con- ditions above specified than any other tried by them or of which they have any knowledge, and it does recommend that a number of magazine muskets be made on the plan for further trial in the field." (See Ordnance Report.)

We are now making these guns to sample them- selves on the demands, and will soon have them in the market.

The following is our scale of prices: Special Maga- zine for large game, weighing from 3 to 3 1/2 lbs., 70 to 85 grs. of powder, 550 to 400 grs. of lead, 8 to 6 lbs. weight, from \$60 and upwards according to finish.
Special Long-range Magazine Rifle or Creedmoor Shoot- ing, 50 grs. of powder, 450 grs. of lead, carrying 2 to 8 cartridges weighing 10 lbs., from \$100 and up- wards.
Magazine guns for general use, carrying 2 to 9 cartridges, 50 grs. powder, 250 grs. lead, from \$40 and upwards.
Single Breech-Loader, Creedmoor shooting, long range, 50 grs. powder, 450 grs. lead, from \$50 and upwards.
Single Breech-Loader for general use, 60 grs. powder, 350 grs. lead, from \$50 and upwards.
The price of all our rifles, unless otherwise ordered, will be \$25-100.

For Forest and Stream.
BALSAM LAKE.

WALTER, stay your restless paddle!
Noiseless let our "dug-out" drift;
Listen to the dreamy murmur
Of the outlet o'er the rift.

All along the sedgy margin
Booms the frog, and further out
Hear the far-off splash and ripple
Of the ever-rising trout.

From the hemlocks grouped together
In the hollow of yon hill,
Looking down the silent valley
Of the shadowy Beaverkill,

Floats the rapture of the woodthrush,
And anon the startled bark
Of the fox, gives distant challenge
To our camp fire's fading spark.

Slow the crescent moon is rising
O'er the hemlock's shattered crest,
And the lonely owl has seen it
From yon gulley in the west.

Hear him hoot far up the mountain,
Pausing in some noiseless flight,
Calling us in hollow accents—
Who—are you—down there—good night! P. C. B.

For Forest and Stream.
Minnesota Notes.

BY SIDNEY WILMOT.

DOWN in Kaudiyohi County, by the shores of Green Lake, lives a brave woman who would blush if I were to write her name for the papers, but who did not hesitate to give good earnest to shoot three fine deer when the fair opportunity came in her way. I thought it was a "yarn" when a neighbor first told me, but when I met her husband, completely verified the story. In the absence of her husband Mr. A—s', A—l, a Swede, came running in, eagerly asking, "Where is Mr. A—? I want him to get a gun and shoot three deer which 'Fanny' is keeping in the lake." "Fanny" is the most useful setter I ever saw. I will tell you more about her another time. Mrs. A— read, "If you will row the boat I will go and do what I want." Taking down her husband's gun she went with the enthusiastic Scandinavians, and in two hours came back triumphantly with a doe and two fawns as the trophies of her skill. I am sorry I cannot give the filling in of the story; but as truthfulness and not exaggeration is characteristic of the choice FOREST AND STREAM, I will not trust upon my imagination. I should like to have seen sport—the panting Swede—the aroused lady—the sagacious dog. The lake is not less than two miles across at its widest point and two hours' pulling, shooting, shouting, bark-must have made it lively indeed. I think I must ask you to write it out for us.

I want sometime to tell you about "Fanny," and I may as well do it now. She is a black and mottled setter—not very large, but powerful, with silky hair, lustrous and soft, beautiful ears, deep, soft, loving eyes. I never see them but once, but shall never forget them. She is a complete retriever—excellent for chickens—will bark at geese, tree bears and make herself generally useful. Her owner told me, "She is my market. In duck season she is hidden in the grass and brings me home on an average of one a week, which she catches alive." Mr. R—, an old hunter, assured me he had frequently captured a full grown duck by merely frightening them with a shot. The fat ducks would waddle out on the shore and the dog would bring him every one. It is five years since, falling in love with the beautiful creature, I gave her owner to let me have a puppy from her. Four years later, when I had changed my home twice and given up all expectation, I received a line from Mr. A—, saying he was ready to redeem his promise and send me a fine puppy. And in due time the little dog came by express. He is full grown now and I hope will have some-

thing to say for himself in your columns some day. I do not often look at his beautiful form without thinking of the gentleman and sportsman at Green Lake who remembered for four years his verbal promise given to a passing stranger as he stopped for a hunter's lunch near his cottage door. Pardon so much personality, but I did want to put such kindness on record. I am "chock" full of brag about "Dan," my first setter, whom I, of course, think a wonderful dog, but I will spare you.

Colonel Crittenden, at Fort Abercrombie, on the western border of Minnesota, in command of the 17th U. S. Infantry, has in connection with a club in his regiment a fine pack of dogs. Two fine stag hounds from General Custar's pack—descendants from a pair Duke Alexis gave him—several choice greyhounds, a string of fox hounds, rare pointers and setters, with some immense Newfoundlands made as fine a sight of dogs as ever gladdened the eyes of a lover of dogs in the west. I am told it never takes them more than four hours to go out and catch an antelope. It is reported that General Stanley had one greyhound in the Northern Pacific Exploring Expedition last summer, which alone caught twenty-seven antelopes.

One result of the formation of a Sportsmen's Club at Brainerd—the headquarters of the Northern Pacific Railroad, where the road crosses the Mississippi River—is better attention to the raising of good dogs. Curs are at a discount. Good dogs cost no more to keep, and aside from those who make it a business, gentlemen are glad to see well bred dogs multiplied.

The N. P. R. R., from Duluth, on Lake Superior, to Bismark, on the Missouri River, passes through a country well adapted to sport. I do not say the woods are all alive with game, but there is abundance of it, and it increases as the Indians are kept closer upon their reservations. There are moose, elk, deer, bears, wild cats in the dense woods east of Brainerd. Probably fifty deer were killed within three miles of Brainerd last winter. West from Brainerd to the Red River the country grows more open and streams, lakes, marshes increase until you reach the wonderful Red River Flats. Here it is entirely within bounds to say ducks can be found by the million. The shallow ponds, the streams, the larger lakes are alive with them. It is no uncommon thing to see a thousand at once from the car window. Passing on a hand-car, between stations, with a good dog, one could make a big bag without leaving the track. At times prairie chickens, (I am content to use the popular nomenclature,) are almost as abundant. At Fargo, in Dakota, it ceased to be any sport to shoot chickens last fall, and one party from Duluth, including Rev. Mr. Heberton, a most accomplished hunter, after bagging eighty chickens one afternoon gave up in disgust, *it was so hard to make the chickens fly*. But it is not always so. It is marvelous where so many chickens hide on other days. From Fargo, on the Red River, for 250 miles out to the Missouri, the country is mostly open rolling prairie. Rivers and lakes are comparatively rare, but when found, abound in fish and attract great quantities of game to their wooded shores. A gentleman who went through on the first train to Bismark, after the snow was cleared, reported seeing "a thousand antelope," *i. e.*, a great many. A personal friend last fall counted thirty antelope while riding from Fort Totten to Fort Seward; elk, wolves, jack rabbits, and other game also abound. Buffalo are rare, as hostile Indians beyond the Missouri watch the fords jealously to prevent their crossing. If you will notice the map of central and northern Minnesota you will see that lakes abound as in no other State in the Union. Nor are they largely marshes or mud ponds, but clear lakes with gravelly shores, spring fed, and many of them of wondrous beauty. Lieut. Maury, unless I am very much mistaken, has said Minnesota has more lakes than all the rest of the country. Of some of these, and of some rare water excursions which may be made on them, and the beautiful little rivers which traverse them, I will gladly speak in another paper. We hope the visitors from the mother country will bring some of their wonderful dogs to the matchless prairies of Minnesota and Dakota. Fair fields and fair play for all dogs and no roughs to interfere.

The general manager of the N. P. R. R. assured me he would extend all possible courtesies to gentlemen from abroad bringing their dogs to a match. Indeed this kindness is characteristic of all the officials of the road, many of whom love dogs and guns, and some of whom are active members of the Brainerd Club. I am personally acquainted with Mr. T. P. Cantwell, Secretary of the Brainerd Club, and know he will cheerfully and thoroughly answer any questions which your patrons may want to ask him.

For Forest and Stream.
TROUT OF THE TRUCKEE RIVER.

NOT having seen a regular speckled trout or brook trout, as they are called, for many years, I have almost forgotten their appearance, but these trout are vastly different both as to size and habits. First let me say the waters of the Truckee River extend from Lake Tahoe, (the head of the Truckee,) to Pyramid Lake, the sink thereof. Tahoe is already known to fame for its fine trout and beautiful surroundings, its unknown depths, treacherous "buz-zum," subaqueous hot springs, and romantic scenery. It is a great resort for tourists, situate on the line between Nevada and California in the Sierras. The Truckee River flows from its north end, and is its only outlet of importance, but the river is fed all along its course by mountain streams of melting snow till it debouches in this basin, where is built Reno, and in which agricultural pursuits are carried to some extent through irrigation, the Truckee furnishing the water supply. The river leaves the basin after an easterly course through it by a canon, and passing a little northerly empties into Pyramid Lake, a large body of water within the confines of the mountains, but not quite so picturesque as Tahoe or Donner Lakes. The country around it affords excellent grazing ranges. Pyramid Lake abounds with feathered game, swan, geese, ducks, &c., the latter of several species, and is the winter quarters of the trout. As soon as the river begins to rise in the spring they start on their pilgrimage for Tahoe, with their bellies full of spawn, and in such vast schools that it is no trouble to get as many as one wishes by simply going to the river for them. The Washoe and Piutes Indians are great fishers, and the loads they take are surprising. They spear, and grab and bait for them. Getting out in the middle of the stream on a rock, they await one's coming, jab a small spear in his back and pass him out. At the several mill dams, with a grab hook, made by fixing four large hooks in a "hunk" of lead, attached to line at end of pole and throwing it at the foot of the fall and jerking it out vigorously they manage to hook from the large numbers gathered there to go over when the water is high enough, great quantities, hundreds of pounds daily at one dam. I do not yarn this at all and venture to say that several tons of trout have been taken this way at the dam here in town at the season of the year mentioned. Standing on its bank near the falls one can see the trout jumping the dam every minute. The grab hook takes the greatest quantity next the bait; either spawn tied in a small sack of mosquito netting of pink color or a minnow does the business. The Isaac Walton, be he Caucasian or native American, fishes any where along the river, but usually where it runs deepest and smoothest, whereas I believe the brook trout of the east is taken from foam of cascade and rapids, and by concealed anglers. Concealment is not necessary here. The bait is thrown out as far as pole and line will cast it and let float down with the current, properly leaded to cause it to sink near the bottom, just to escape the rocks and sunken logs, and when all the line is out is pulled up and thrown again out and up stream. The trout takes it freely and is easily landed, not by jerking the fish out of the water, but by playing him ashore. I have seen some fly hooks used by fancy anglers, but they do not seem to be a favorite bait. Spawn or minnows are preferred. Hooks are used from number four to larger. The grab hooks are much larger. The Kirby hook is preferred to the Limerick. Now as to appearance and size of the trout. There seems to be two distinct species, though similar in appearance. Instead of

red specks these have black specks, and golden sides, dark backs, light bellies, little or no scales, huge mouth. The golden color is not upon all, which seems to be a distinction in the kind. The speckles are round, black and run in lines the whole length of the body. The smallest one I have seen weighed three-quarters of a pound, and ten pounds full was the weight of one an Indian speared, but the average is two and a half and three pounds, many being heavier. The meat is darker than whitefish, of good flavor, some bones in the smaller ones that bother about eating, especially with "store" teeth. Most people prefer the one pound trout, on account of the sweeter flavor. I don't; bones too numerous and small. They sell at 12½ cents per pound in this market. Great quantities are sent to San Francisco and Sacramento while the weather is cold enough to send safely. The lines used are the ordinary linen lines or grass lines. Cane poles, or any that are strong enough, and the longer the better, to get the bait cast out to the middle of the stream or as near as possible in the deepest channel of the river. There are no fish laws in Nevada, nor any game laws except for quail, which expire, in August or September. Enterprising men have imported the eastern quail into California recently, and they seem to do well. Eastern fish are also brought to this coast. At or near Tahoe is a man engaged in fish culture; what he does with them I cannot say. The silver trout, so called, of the Truckee River, differ but little from the darker ones, being a lighter color only.

RENO, Nevada, March, 1874.

For Forest and Stream.

HOW TO SHOOT AT LONG RANGE.

NUMBER FIVE.

THE last source of error that we have to describe is that of the operator, or rifleman himself. All of this class of errors may, we believe, be included in one grand one, and if he avoids this he will escape all the rest. This is, *not pulling the trigger at the right moment*. No rifleman need ever expect to hold his rifle still. So long as its butt rests against a human organism the movements of respiration and circulation will cause the muzzle to describe a series of curves, infinitely small perhaps, but quite perceptible if one looks through a telescopic sight. The only thing that can be done is to accept the fact of a movement, and pull the trigger while the axis of sight is moving toward the bulls eye, and at that happy instant, so that the projectile will neither fail to reach it nor be thrown beyond it.

This art can be acquired, and, when acquired, kept by *practice* only. Moreover, practice at Mr. Conlin's suspended bullet, at seventy-five feet distance, is just as good as practice at the Creedmoor bulls eye at 1,000 yards. When the rifleman has acquired this union of the nerves of volition and action, so that he pulls, without jerking, just at the right moment, he can tell as soon as he has pulled the trigger, and before hearing from the marker, whether his shot has been a good one or not. That is to say, if his cartridge was properly loaded and his rifle properly sighted.

Having acquired this power, his chief effort should be to so adapt himself to external circumstances as not to interfere with it. He should therefore take that position in which he finds he can do it best, whether it be kneeling, sitting, or lying flat. He should dress in such a manner as to keep himself perfectly comfortable, and not cramp his freedom of movement. He should eat, drink, and smoke (if he is a smoker) with moderation, for any disarrangement of the stomach acts upon the nerves at once, and the power is lost. Finally, he should keep his temper, whether a bulls eye or a miss is recorded against him.

Match rifle shooting is very like match billiard playing. Some men can do very well in private what they utterly fail to do in public. These are not the men to compete with the Irish team. If the Irish team are beaten, we believe it will be because their bodily condition will not be as good as it is at home. It is child's play to shoot at long range at Creedmoor, where the clear light of an American afternoon scarcely varies, and those optical illusions that we have described are rare compared to Wimbledon, with its broken ground, and mirage arising from the moist English air constantly changing the elevations of sights. It is a fortunate thing that the challenge was for American ground, and not for English. Here we have some chance for beating them; there the chances would have been decidedly against it.

We have a few words in conclusion to say about marking, and then our sermon is done. The Wimbledon system of marking, admirable in other respects, has one defect. It is not sufficiently accurate either to record our shots, so that practice may teach us experience, or for the purpose of determining ties. A slight addition will remedy this defect, leaving the system untouched. In addition to the usual marking of centre and bulls eye, divide the target into squares of one foot apart. Number these squares like the sections of a western township, from right to left and from left to right. These numbers need not actually be put on the target, but on a diagram.

If telegraph wires are used (as they should be), the marker at the butt signals the number, as well as the hit, thus:—B. 41, or C. 69, or O. 2, as the case may be. If there is no telegraph, the marker holds his disk over the square hit long enough for the recorder at the firing range to recognize what square it is, which he can do from its position, aided by the knowledge of whether it is bulls eye, or centre, or outer. At very long ranges a telescope would be necessary. The number of the square hit is entered in the rifleman's notes, along with the degrees and minutes of actual elevation, the state of the weather, etc., etc. This system is used on practice days, when the object should be to give all the information possible to the rifleman.

But match days should be looked upon as examination days, to see how much progress each man has made. The rifleman then should be told nothing, and not allowed to use a telescope. The only use of the squares (which should be recorded as usual) would be in determining ties. For example—of two bulls eyes, one is in square 41, the other in square 56; 41 is of course the highest. Some squares are of equal value as removed from the absolute centre, but it would be easy to get over this difficulty by agreeing to rank the squares which are equal in position by their numbers. Thus of the four bulls eye squares—30, 31, 42, and 43—it should be agreed that 43 was the highest value expressed as a rule. Ties shall be decided by taking the hit upon the nearest square to the centre as the highest; if both hits are on squares equally distant from the centre, that upon the square numbered the highest shall be taken to be the highest. The adoption of this rule would abolish the tedious shooting off of ties, which everybody, we believe, heartily abhors.

T. C. C.

THE NEW SIGHTS ON THE REMINGTON RIFLE.

LONG ago we pointed to the necessity of constructing carefully adjusted sights for our rifles. Believing that our breech-loaders, as far as mechanism and material went, were very nearly perfect, we felt certain that all that was wanted to achieve excellence was, that our manufacturers should pay greater attention to their sights. We

present to-day to our readers a carefully executed cut of the Remington sights, which will be used this season at Creedmoor on their target rifles. The back sight is placed just behind the hammer, on a permanent pedestal, but the upright can be removed at pleasure. It moves on its joint backwards, forwards, and when the sight is not in use it can be brought down flat to the cheek piece of the rifle. The back sight has an orthoptic aperture, a minute hole in a cup-shaped convex disk. This disk can be raised or lowered to the various elevations required, and is worked by a thumb screw. There is a vernier scale allowing the most minute measurements to be appreciated. When moving the sight up or down, the disk is slightly loosened, one turn or so secures the whole apparatus and it remains fixed when the proper elevation is obtained. The whole is carefully darkened, so as to give no sparkle of light, which might dazzle the marksman. The front sight is the bead one,

FRONT SIGHT.

neatly covered over, so as shade it properly, mounted on a transverse bar, so that it can be moved by means of a screw at right angles with the barrel to the right or left, in order to correct drift or effects of wind. When the front sight is the central position, it rests between two division marks designated by a little mark on each. When the sight is moved either way, the distance is read from the mark opposite the direction in which it is moved. The whole arrangements are very perfect and compact in form, and will doubtless add immensely to the efficiency of the already justly celebrated gun, when used at long ranges. We notice also, that to meet the wants of various rifle men, these target rifles are now made when required with a combination pistol-handle. The whole mechanism reflects great credit on the Messrs. Remington, who have spared no pains or expense in producing a most accurate and convenient

sight. We add table of elevations for the Remington rifle. The sights are graduated to single minutes of elevation. The graduations on front sight correspond to 2 inches per each 100 yards, or say 20 inches at 1,000 yards. The table of elevations will be published by us later.

Natural History.

For Forest and Stream.

BIRDS OF LAKE OKEECHOBEE.

[Herewith we publish the first list ever obtained of the birds of Florida peculiar to the Lake Okeechobee region; and we can share to a certain extent the pride and satisfaction of our most indefatigable Florida commissioner in thus being able to contribute this valuable addition to the fund of natural science.]—Ed.

1. Wilson's thrush, (*Turdus fuscescens*). Saw one specimen on Lookout Island, the only island dry enough to afford residence to birds of this family.
2. Cat bird, (*Galeoscoptes Carolinensis*). Upon the eastern shore, saw several in the elderberry thickets.
3. Blue gray gnat-catcher, (*Poliophtila caerulea*). Abundant in the boxwood and ash on the eastern shore.
4. *Troglodytes aedon*, (common wren.) Rarely seen.
5. Yellow redpoll warbler, (*Dendroica palmarum*). The most abundant species of the warblers here as elsewhere.
6. Yellow crowned warbler, (*Dendroica coronata*). This species seemed to delight in the maple swamps, and where those trees were interspersed among the cypress, these beautiful little birds were to be found; comparatively abundant.
7. Maryland yellow throat, (*Geothlypis trichas*). Rarely seen in the marshy hammocks bordering the shore.
8. White bellied swallow, (*Tachycineta bicolor*). Numerous; flocks of them were seen flying over the marshes near Kissimmee Bay and along the western shore.
9. The purple martin, (*Progne purpurea*). Was abundant in the pine woods near the Kissimmee above, though none were seen near the lake.

10. White eyed vireo, (*Vireo noveboracensis*). Common in the cypress belt, wherever there was a thick undergrowth. Its peculiar note was the one most frequently heard.

11. Savannah sparrow, (*Passerculus savanna*). Not numerous.

12. Cardinal bird, (*Cardinalis Virginianus*). We missed the pleasing song of this bright songster as soon as we left the live oaks upon the Kissimmee, but after we had emerged from the desolate marshes and gained the first maple island their notes fell upon our ears; not numerous.

13. "Chewink," (*Pipilo erythrophthalmus*). Upon the Kissimmee I saw them in abundance, and a few upon the dry sand of Lookout Island, scratching among the dead leaves. I also detected the local variety, or species, discovered by Mr. Maynard on the St. John's, having the iris white instead of hazel.

14. Cow blackbird, (*Molothrus pecoris*). Not so numerous as the red wing.

15. Red winged blackbird, (*Agelaius phoeniceus*). Very abundant. Everywhere seen in the marshes, enlivening us with their presence and song.

16. Meadow lark, (*Sturnella ludoviciana*). The pine woods near the Kissimmee contained this species in abundance, but none were observed near the lake, owing to the swampy character of the shore.

17. Purple grackle, (*Quiscalus purpureus*). Very numerous, this and the Florida species, *Q. bartrus*.

18. Boat tail grackle, (*Quiscalus major*). Extremely abundant, associating in flocks with the red wings and purple grackles.

19. Common crow, (*Corvus Americanus*). Very few seen.

20. Fish crow, (*Corvus ossifragus*). Abundant everywhere; made sad havoc with the eggs in heron rookeries wherever we landed.

21. Blue jay, (*Cyanurus cristatus*). None seen; few heard on the east shore.

22. Pewee, (*Sayornis fuscus*). Very few seen in the larger hammocks.

23. Kingfisher, (*Ceryle alcyon*). Comparatively abundant along the Kissimmee and all sides of the lake.

24. Chuckwill's widow, (*Antrostomus Carolinensis*). A few heard at the deserted Indian village on the east shore.

25. Ivory bill woodpecker, (*Picus principalis*). None satisfactorily identified, though I caught a glimpse of several which I then thought to be this species.

26. Pileated woodpecker, (*Hylotomus pileatus*). Abundant; its noisy, rattling note could be heard in all the cypress belts.

27. Red bellied woodpecker, (*Centurus Carolinus*). Numerous; the most abundant of the *picidae* here, as well as all over Florida.

28. Golden winged woodpecker, (*Colaptes auratus*). Not numerous.

29. Paroquet, (*Conurus Carolinensis*). Few flocks seen. Along the upper portion of our route on the Kissimmee they were abundant. I think they breed in the cypress belt of the east shore.

30. Turkey vulture, (*Cathartes aura*). Seen everywhere sailing high over the lake, or suddenly flapping out of some thick cypress.

31. Black vulture, (*Cathartes atratus*). Rare.

32. Caracara eagle, (*Polyborus Brasiliensis*). Not numerous. Regarding this species, and the sacred vulture of Bartram, I shall have some notes in a future number.

33. *Falco sparreri*, (sparrow hawk). Abundant along the Kissimmee; rare on the lake.

34. *Buteo lineatus*, (red shouldered hawk). Most numerous species, having young in nearly every large collection of trees.

35. Fish hawk, (*Pandion halietus*). Everywhere abundant in the lake. None of the white headed eagle were seen in the whole trip, though the osprey had nests everywhere.

36. Barred owl, (*Syrnium nebulosum*). Numerous; young found a week old. Its hootings filled the air every night.

37. Great horned owl, (*Bubo Virginianus*). Saw none, but heard several.

38. Wild turkey, (*Meleagris gallopavo*). The shore of the lake is not suited to the habits of the turkey, though we saw feathers at the old Indian camps, probably brought there from the hammocks above on the Kissimmee, where it is comparatively abundant.

39. Quail, (*Ortyx Virginianus*). None seen on the lake, though beys met with above.

40. Killdeer plover, (*Egialitis vociferus*). Abundant on the Kissimmee; none seen on the lake.

41. Snipe, (*Gallinago Wilsoni*). Abundant on Kissimmee.

42. Yellow legs, (*Gambetta flavipes*). Very numerous on the Kissimmee.

43. Red breasted snipe, (*Macrorhamphus griseus*). Abundant at the ford on the Kissimmee.

44. Sand hill crane, (*Grus Canadensis*). But one seen on Okeechobee; abundant on the prairie of the Kissimmee.

45. Clapper rail, (*Rallus crepitans*). Many heard; none seen.

46. Purple gallinule, (*Gallinula martinica*). Not numerous; in the lily pads of the lake border.

47. Coot, (*Fulica Americana*). Abundant.

48. Louisiana heron, (*Demigretta ludoviciana*). Not very abundant.

49. Snowy heron, (*Garzetta candidissima*). Not numerous.

50. White heron, (*Herodias egretta*). Very numerous. Along the river and in several places in the lake I found them breeding in large numbers. The eggs were laid about February 15th and 20th; no young then hatched.

51. Great blue heron, (*Ardea herodias*). Abundant; not near so many as of white; breeding.

52. Blue heron, (*Florida coerulea*). Not common.

53. Least Bittern, (*Ardetta exilis*). Rarely seen.

54. Green heron, (*Butorides virescens*). Very plentiful, and breeding.

55. Night heron, (*Nycticorax griseus*). Common.

56. White ibis, (*Ibis alba*). Exceedingly numerous, especially along the river. They had not commenced breeding, to all appearances.

57. Roseate spoonbill, (*Platalea ajaja*). Two pairs found breeding on an island in the lake; several seen there. The Indians say they breed abundantly on Fish-eating Creek.

58. Crying bird, (*Aramus giganteus*). Very numerous along the Kissimmee and western lake shore. Eggs had been taken a month before our arrival, February 22d, according to a resident on the river.

59. Green wing teal. Abundant along the Kissimmee.

60. Wood duck, (*Aix sponsa*). The most abundant, in fact the only resident species I saw on the lake. They were apparently breeding, as they were occupying holes in the dead cypress of the east shore.

61. Florida cormorant, (*Graculus Floridanus*). Abundant, and breeding on the shore bordering the Everglades. The custard apple trees there were filled with their newly built nests.

62. Snake bird, (*Plotus ankinga*). The most abundant species, with the exception of the white heron, on the lake or river. It had both eggs and young as early as February 23d; everywhere abundant. No mammals were seen about the lake, and signs only of rabbit and raccoon. Deer occurred on the Kissimmee prairie, but in small numbers.

FRED. A. OBER.

—Our Philadelphia correspondent, A. M. S., sends this description and habitat of a Pennsylvania fish which wants a name:—

EDITOR FOREST AND STREAM:—

In nearly all the streams of Pennsylvania east of the Alleghenies there is to be found a fish which in common parlance is known as the *chub*. In Maryland, where, years ago, I found considerable sport in taking them, they were popularly known as the *fall-fish*. Now, will some one of your many intelligent correspondents oblige me with its true technical name? I presume it is unnecessary to describe it in detail. I will, however, say that the fish alluded to attains a weight of from one to four pounds, is what may be termed oblong, rather flat, head and back greenish, sides silvery, belly pure white. It is a quick biter, will rise to a white bait, and when of good size is somewhat plucky. They are taken in the Wissatien and Schuylkill rivers, and I presume all other streams in which they abound during the bright days of winter and spring, their special preferences being for a white grub bait. But why enlarge upon the subject? I presume nearly all your sporting readers are familiar with it, and hope some one will find it convenient to reply to my inquiries.

A. M. S.

—A correspondent in Florida sends us the following incident of a heron and rat:

EDITOR FOREST AND STREAM:—

In an inclosure near the steamboat landing at Palatka, Florida, are several curlew, some alligators and one or two white herons, and they furnish amusement, especially at feeding times, to a mixed audience of idle visitors and small and parti-colored natives. A few days ago a very impudent rat infringed upon this space, and to the surprise of a gentleman who was passing, was instantly caught by the tail by one of the white herons, who, after a few skillful movements, tossed him up, and after a sharp pinch, deliberately proceeded to swallow him, apparently enjoying the morsel as one of unusual flavor. The beautiful bird then assumed an elegant position, as if above all the wants of mortal life, and subsequent visits proved that his meal suited him as well as it would a Chinaman.

L. W. L.

ARLINGTON, Mass., April 10, 1874.

EDITOR FOREST AND STREAM:—

Notice in FOREST AND STREAM of April 2, an item stating that frogs, if subjected to torture, will shriek like a child. The above statement I can fully corroborate. While walking near a pond last summer I surprised a large bull frog (*Rana pipiens*) some distance from the water. On cutting off its retreat to the pond, and while poking it with a stick, it uttered sounds resembling the cries of a frightened child. Continuing my annoyance its cries of fear changed to shrieks of rage, and it bit repeatedly at the stick. It would be interesting to know whether this is the usual behavior of the creature under like circumstances.

MERLIN.

NEWBURG, N. Y., April 13, 1874.

EDITOR FOREST AND STREAM:—

More than fifty years ago Captain Henry Robinson, owner of one of the Havre packets, brought the first carp and goldfish to this country from France. He placed them in a small pond on his place in the southern part of this village. Several years ago, when the dam of the pond broke away, many of the fish escaped to the river. They appear to multiply very rapidly, and any number might be obtained from the fishermen about the bay.

In the year 1825 the English frigate *Hussar* visited New York. Her

captain was owner of a London built, four-oared gig, which had never been beaten. Captain Harris of the *Hussar* challenged any crew in New York for a race, and the challenge was at once accepted by Captain Robinson, who named the boat "American Star," to be rowed by the Whitehall boatmen—Cornelius Cammeyer, Alfred Cammeyer, Richard Robbins and Charles Beattie; coxswain, John Palmerton. The Whitehallers won the race easily. The "American Star" was subsequently presented to General Lafayette and sent to Havre. Yours, R.

THE BLACK BASS.

ALBANY, N. Y., April 13, 1874.

EDITOR FOREST AND STREAM:—

An article on Black Bass, by A. J. Collins, in your issue of the 2d inst. impels me to say something on the same subject. DeKay says: "The black fresh water bass, *Centrarchus fasciatus*, is common in the Great Lakes, and in the smaller ones of this State" (New York), and the specimen described by him and also illustrated in the Natural History of the State of New York, taken from Oneida Lake, was divided, as regards fin rays, as follows, viz.: "Dorsal, anterior portion with 9 stout spines; a small and not very evident depression separates it from the other portion, which consists of 1 spinous and 14 branched rays. Pectorals with 18 rays; ventrals with 5 robust, branched rays; anal, 8 spinous and 12 articulated rays; caudal, 16 flat, robust rays, and 6 accessory rays on each side."

I have taken bass at various times, covering a number of years, with the fly, spoon, gang, live minnows and belly of yellow perch, in the outlets of Lake Ontario, and in the St. Lawrence River, from its confluence with the lakes to Alexandria Bay, including both sides of the river, and among the islands, and I find that the fish called there, and also in Albany, black bass, has its fins divided into—dorsal, 10 and 1 spine and 15 soft rays; pectorals, 17 rays; ventrals, 1 spine and 5 soft rays; anal, 3 spine and 12 soft rays; caudal, 17 3-3 rays. I have also taken, casting with the live minnow, in the early part of September, between Ganauoque and Kingston, Ont., bass, called there Oswego bass, which I know no scientific description of and no technical name for. The dorsal fin of this fish contained 9—1 spine rays and 14 soft rays; pectorals, 1 spine and 14 soft rays; ventrals, 1 spine and 5 soft rays; anal, 3 spine and 12 soft rays; caudal, 16 6-6 rays. The weight of specimen was 4 lbs., length, 18 inches; greatest depth, 6 inches; thickness at the anterior part of dorsal, 3 inches; length of head, 6 inches; mouth, twice as large as the preceding species; color of the back, greenish black; sides, yellowish and pink; belly, whitish around the sub and inter operculars, and the pectoral and ventral fins reddish. Yours respectfully, W. W. HILL.

The Horse and the Course.

—The American Jockey Club will open their spring meeting at Jerome Park on Saturday June 6th, and continue on Wednesday the 10th, Saturday the 13th, Tuesday the 16th, Thursday the 18th, and Saturday the 20th. The improvements made this spring on the Club's course are very noticeable, such as the widening of the course, a straight run of half a mile, which will tend to show an increase of speed, avoid collision in handicaps and two year old races where there are many starters and give full view of the horses from the grand stand. The track has been almost freshly laid and covered with a thick loam, care having been taken to pick the stones from it, which has resulted in making one of the handsomest running tracks in America. All these repairs and improvements have been made under the superintendence of Mr. Charles Wheatley, the Secretary of the Club, and under his able management have made this course one of the best and popular ring tracks in the world. The following is the programme of the meeting. The races commence each day at three o'clock:—On the first day the sport begins with a dash of three quarters of a mile for all ages, with maiden allowances; followed by the Fordham Handicap, a mile and a quarter; The Withers' Stakes, for three-year-olds, one mile; and the Westchester Cup, for all ages, two miles and a quarter. On the second day there is a dash of a mile, for all ages; a handicap sweepstakes of a mile and an eighth, the winner of which is to be sold for \$1,000; The Jockey Club Handicap Sweepstakes of two miles; and a handicap steeple-chase over the usual course. On Saturday, the third day, the sport will begin with the Belmont Stakes, a mile and a half, for three-year-olds; followed by the Juvenile Stakes, half a mile, for two year olds; a dash of a mile and a half for all ages; and a race of mile heats. Tuesday, June 16, opens with the Ladies' Stakes, for fillies, three years old, \$100 each, half forfeit, with \$1,000 added; one mile and a half; closed with forty nominations. The second race is a purse of \$600, one mile and a quarter, the winner to be sold for \$1,500. The third race is a dash of one mile and three-quarters, for a purse of \$700, and the day will end with a handicap hurdle race, purse of \$700, one mile and three-quarters, over seven hurdles. On Thursday, June 18, there are five races:—First, purse of \$500, for maidens, one mile and a half; second, purse of \$700, one mile and three-quarters; third, purse of \$600, for three-year-olds; miles to carry 105 lbs., beaten maidens allowed 5 lbs., the winner of the Withers Stakes to carry 5 lbs., and of the Belmont or Ladies' Stakes 7 lbs. extra, one mile and a quarter; fourth, Members' Cup, valued at \$400, added to a handicap sweepstakes of \$25 each, play or pay; three to start or no race; one mile and an eighth; fifth, handicap steeplechase, purse of \$800, about two miles and a half. Saturday, June 20, the last day of the meeting, also has five races. These are as follows:—First, purse of \$500, for two-year-olds, half a mile; second, purse of \$500, for three-year-olds which have not won this year, one mile; third, free handicap sweepstakes of \$25 each, with \$500 added, one mile and an eighth; fourth, free handicap sweepstakes of \$30 each, with \$600 added, one mile and five-eighths; and fifth and final, a free handicap sweepstakes of \$50 each, with \$1,000 added, two miles and a half.

—The May meeting of the Goshen Park Association occurs on the 20th, 21st and 22d days of May. There will be running and hurdle races together with the trotting races. The purses amount to \$7,500 as follows:—Three minute horses, \$1,000; two-fifty horses, \$1,000; two-forty horses, \$1,000; two-thirty horses, \$1,000; two-twenty-six horses, \$1,500; two twenty-two horses, \$2,000.

—The Louisiana Jockey Club held the fourth day of the meeting on April 20th. The track was heavy. The first race was one mile and one eighth for three year olds, Club Purse \$500. The race was won by Bay Rum. Time, 2:14. The second race was a selling race, one mile and a half, Club Purse \$500. Edwin Adams won. Time, 2:59. The third race was mile heats, best three in five for all ages, Club Purse \$800. Donnybrook won in three straight heats. Time, 1:59, 2:00, 1:58. The meeting closed on the 21st.

Billiards.

—Maurice Daly has accepted C. Dion's challenge and covered his forfeit of \$250 to play a game of 600 points, three ball caroms, for \$1,000 a side. The game will be played on Friday evening, May 15th, in Tammany Hall, and will, as did their last contest, attract a large audience, as they are generally considered pretty evenly matched, although Daly, partly owing to his famous run of 212 in their last match, is slightly the favorite in sporting circles. Some amateurs look for a repetition of the big run but they must recollect it was a remarkable performance, even in this age of "big billiards," and not often repeated.

—It is reported in billiard circles that an unknown will soon challenge Garnier for the championship, and much curiosity is manifested as to said unknown's identity.

—William Dodds, of Pittsburg, Pa., who has been passing a few days in this city, has challenged E. Welms, of Philadelphia, to play a three ball game for from \$250 to \$500 a side, and it is reported for the State Championship. Welms, in answer, proposes to play a home and home match, one three ball and one four ball game.

—Joseph Dion and Maurice Daly are billed for an exhibition at Sandford's Rooms, Newark, next week. Mr. Dion has charge of these rooms, and business has much improved under his management.

—There will be a billiard tournament held in this city some time next month under the direction of Mr. M. Delany, of Wire Cushion fame, and everything will be done to make the meeting pleasant and memorable for skillful playing. It is reported on good authority that Rudolph's departure for South America was a canard, and that he will be on hand to play in the tournament.

—Mons. Ubassy has dissolved his connection with Silverbrand's Rooms. Monsieur is playing well and does not lack backers, as a well known gentleman has repeatedly expressed his readiness to back him for \$1,000 against any one at the three ball game. Table and length of game not specified.

—Last Friday evening Mr. Joseph Price and William Fulgrave played a game of 200 points (French) for \$50 a side. Price won the game by 18 points. Highest runs—18, 16, 14, and 12. The game was played at the Fulton Hotel, 4th avenue.

—Messrs. Cyrille Dion and Maurice Daly have commenced practising for their match, Dion at his rooms, No. 1,239, Broadway. Daly will play practice games with leading experts every Tuesday and Thursday evenings at the Spingler House rooms.

—There are several fine and profitable cocoanut groves at Miami, on Biscayne Bay, Florida. The trees bear all the year round.

—Letters from Rev. J. C. Macdona, "Homo," "Idstone," F. C. Pearce, Esq., of the Kennel Stud Book of England, are unavoidably left over.

—Mr. Egolf, while gunning on Rattlesnake Hill, was confronted by a pole cat and six young ones. The battle was not with the strong, for he killed the whole seven at one shot.

—The Mississippi River is now said to be fifty miles wide from Cairo to the Gulf, and an extent of territory larger than the State of New York is under water.

—A convention of fish culturists was held at Lexington, Kentucky, on the 18th instant for the purpose of forming a permanent association.

—The town of Waldoboro' has appropriated \$2,200 for the purpose of building a fishway, under direction of the State Commissioner of Fisheries.

NATURAL WONDERS ON THE OTTAWA.—A professional gentleman of this locality sends us for publication the particulars of a floating island, which he has observed in one of the back townships of Argenteuil. Between the third and fourth ranges of Wentworth is a sheet of water about a mile long and half a mile wide, called Long Lake, through which flows the West River. In this lake there is a small island about three quarters of an acre in length and breadth; this island, says our informant, has trees growing upon it, and floats up and down the lake by the action of the wind. Our informant says he landed upon the island and found it of a marshy or cranberry-swamp character. It is said that during a recent lumber season the island floated to the lower end of the lake, where it blocked up the outlet to the river, and caused no inconsiderable effort on the part of the lumbermen to tow it away and free the passage for the logs. This country is rich in natural wonders and magnificent scenery. We hear of a stream called the Lost River, which suddenly disappears beneath a huge mass of rock, and reappears at the surface a distance of some three or four miles further on. There is also in the country a trembling mountain of great height with a lake at its summit. The scenic attractions of Argenteuil require only to be made known in order to be visited by a large concourse of tourists in the summer season.—*Argenteuil (Canada) Advertiser*

THE WHITE ROVER.

THEY called the little schooner the White Rover,
When they lightly launched her on the brimming tide;
Staunch and trim she was to sail the broad seas over,
And with cheers they spread her snowy canvas wide.

And a thing of beauty forth she fared to wrestle
With the wild, uncertain ocean far and near,
And no evil thing befell the graceful vessel,
And she sailed in storm and sunshine many a year.

But at last a rumor grew that she was haunted,
That up her slender masts her sails had flown
Unhelped by human hands, as if enchanted,
As she rocked upon her moorings all alone.

Howe'er that be—one day in winter weather,
When the bitter north was raging at its worst,
And wind and cold vexed the roused sea together,
Till Dante's frozen hell seemed less accursed.

Two fishermen, to draw their trawls essaying,
Seized by the hurricane that plowed the bay,
Were swept across the waste; and hardly weighing
Death's chance, the Rover reefed and bore away

To save them—reached them, shuddering where they waited
Their quick destruction, tossing white and dumb,
And caught them from perdition; then, belated,
Strove to return the rough way she had come.

But there was no returning! Fierce as lightning
The eager cold grew keener, more intense.
Across her homeward track the billows whitening,
In crested mountains rolling, drove her thence.

Till her brave crew, benumbed, gave up the battle,
Clad in a mail of ice that weighed like lead;
They heard the crusted blocks and rigging rattle,
They saw the sails like sheets of iron spread;

And powerless before the gale they drifted,
Till swiftly dropped the black and hopeless night,
The wild tornado never lulled nor shifted,
But drove them toward the coast upon their right,

And flung the frozen schooner, all sail standing,
Stiff as an iceberg on the icy shore;
And half alive her torpid people, landing,
Crept to the light-house, and were safe once more.

But what befell the vessel, standing solemn
Through that tremendous night of cold and storm,
Upon the frost-locked land, a frigid column,
That glittered 'neath the stars a ghostly form?

None ever saw her more! The tide upbore her,
Released her fastened keel, and ere the day,
Without a guide and all the world before her,
The sad, forsaken Rover sailed away.

Yet sometimes, when in summer twilight blending,
Sunset and moonrise mingle their rich light,
Or when on noonday mists the sun is spending
His glory, till they glimmer thin and white,

Upon the dim horizon melting, gleaming,
Slender, ethereal, like a lovely ghost
Soft looming in the hazy distance dreaming,
I seem to see the vessel that was lost.

MRS. C. THAXTER—*Atlantic Monthly*.

Fish Culture.

This Journal is the Official Organ of the Fish Cultur-
ists' Association.

THE MICHIGAN GRAYLING AND ITS
HABITAT.

I SEND you herewith as promised a full account of our investigations in Michigan, after the grayling. Our party, consisting of D. H. Fitzhugh, Jr., his nephew Frank Fitzhugh, his faithful guide, philosopher and friend, Leonard Jewell, and your correspondent left Bay City by rail at 1 P. M., with five whiskey barrels, tent and camping outfit for Crawford, 93 miles northwest, which we reached at 6 P. M. This road at present only runs one train, which goes up one day and down the next; it is an ascending grade nearly the whole way up, gradually attaining an altitude at Crawford, or "Grayling" as I will hereafter call it, of 750 feet above the level of Lake Huron, nearly the highest point on this peninsula. Here the railroad crosses the Au Sable about twenty miles from its extreme source, a beautiful spring stream twenty yards wide, with water so cool and clear that it reminds one of Caledonia Creek; at this point it never freezes, and rarely rises above a foot. Within a hundred yards of the crossing is the railroad station and the "Grayling House," kept by M. S. Hartwick, a new frame house where most excellent accommodations are furnished at very reasonable rates. The town also contains seven or eight dwellings mostly occupied by railroad men; the trains stop here for meals.

Four miles west is Portage Lake, the head of the Manistee, whose waters empty into Lake Michigan, where it is said you can launch your boat and float to the lake, 150 miles by river, with capital fishing for grayling a great part of the way. The surrounding country is sandy pine plains, with patches of pine timber, and ten miles north is the "hard wood country." There are no settlements except an occasional railroad station, and the nearest lumber camp forty miles down the river by its course, or twenty miles as the crow flies. If what pine there is in the immediate vicinity of the river is cut off there is nothing to invite the permanent settler, as it leaves a country attractive only to the trapper and the sportsman, and it is possible that the grayling may find safe spawning and feeding ground here for many years to come. Thirty miles north, the line of railroad, (not yet completed,) will strike the source of the Cheboygan River, which flows north and empties into Lake Huron, twenty miles east of Macinaw. This river has trout

at its mouth where there are settlements, and it is said that all its tributaries have them, but I could not learn that it has grayling. It drains a large and wild portion of the State where the angler will find a field for many years to come. Trout are said to be plenty in the Oqueoc and streams emptying into Hammond's Bay, but my inquiries failed to prove that there were also grayling there, and from what I could learn from men who have been on the different streams, the grayling in Michigan is confined on the east side to the country bounded on the north by Thunder Bay River and on the south by the west branch of the Rifle, while on the west side it is contained between the Mainstee and the Muskeegan and its branches. The questions naturally arise, How came this fish here in this confined locality? and why after becoming established and living here for perhaps ages, have they not become more widely disseminated? The trout are supposed to have stocked all streams emptying into a lake or river by means of stragglers, but if the grayling strayed from one side of this peninsula to the other, then why do they not occur in the streams flowing north to the straits? Or did they go over the ridge of land four miles from the Au Sable to Portage Lake? These may be classed with Dundreary's "things that no fellow can find out."

Saturday morning, the 28th, we found it snowing and the thermometer seventeen degrees; we put our whiskey barrels in the river to soak; if the reader thought they were full he over-rated our capacity. We then brought our boats from the station house and launched them, one a scow fourteen feet long and two and a half feet wide, the other a canoe, both provided with wells to keep fish alive; into these we loaded our camp equipage, Mr. Fitzhugh kindly giving the novice his best boat and his powerful adjutant "Len" to pole him, while he and his nephew followed in the scow.

The navigation for two miles down is difficult, as the stream is full of fallen cedars often reaching from one side to the other, which have probably laid there from time immemorial; some can be floated over or run under, while others require the boat to be lifted over them, or all hands to climb over and drift the boat under. The Indians have cut a trail in some places just wide enough for a canoe, and fly fishing in this part is therefore almost an impossibility, as the overhanging brush invites the artificial insect to linger in its branches. The river here is two to four feet deep, and the current is strong as in all parts where I saw it; the banks are higher than farther below, with pine, cedar, balsam, and birch; the temperature of the water was about thirty-five, and the bottom was a black loamy deposit near the shore, changing to bars of sand and clean gravel in the centre of the stream where the current swept. Two miles down the river receives two tributaries which double its size; its banks are lower, nearly flat, and many small islands occur; there are few logs and a boat can be poled steadily. About 4 P. M. we hauled ashore five miles from Grayling, (the town not the fish, for we had seen many schools of them,) and selected a camp site within fifty feet of the river among the underbrush, Leonard having been influenced more by the number of dry birch trees for firewood within easy distance than anything else; but tent pitched, wood cut and supper eaten, we made our bed of cedar boughs on top of the snow, spread our blankets on them, christened our abiding place "Camp Hallock," and holding aloft a copy of FOREST AND STREAM claimed the surrounding country in its name, therefore this paper has full power for all future time to levy contributions from it. Thermometer at sun down four degrees, and when Leonard replenished the fire at midnight it was ten degrees below zero. The next day being Sunday we staid in camp and talked about fishing, and Mr. Fitzhugh now told me that he should not fish until Wednesday the first of April, that as he had been active in getting the law passed making this date the opening of the season he should of course respect it. Then, as his guest, I could do no less than do the same, no matter what desire and fever of expectation I was in to catch and examine this new fish that I had traveled nearly six hundred miles to behold and a large school of them within a stone's throw! I could however have a better chance to examine the stream than if occupied with fishing and I could learn many things perhaps concerning food, habits, spawning beds, &c. Thermometer—to-day, fifteen degrees at 6 A. M.; twenty-nine degrees at noon and twenty-four degrees at sun down.

Monday 30th, nearly noon, the weather was mild enough and we went exploring. The banks here are covered with cedar, birch and tamarack; the edges of the stream lined with alder, red willow and cranberry, (high bush;) the bottom is as above, sand gravel and a loamy deposit; the sandy portions are shallow, perhaps two to three feet; current swift and the sand is bright and beautifully "shingled," with sometimes a deep channel near one bank where the bottom is black; here the fish feed. The river is very crooked, Camp Hallock being in a bend where it lay both before and behind, being only a few rods across, but a mile around. Saw a few places that had been swept for spawning, and so many good spawning places everywhere that it must puzzle a fish to choose. We did not see any fish on the beds, they were in schools of fifty to several hundred; noticed many yearlings, three to four inches, generally by themselves, but often with large ones; saw many fish that would weigh nearly two pounds; fish not rising to-day. Thermometer—6 A. M., seven degrees; noon, thirty-six degrees; sun down, twenty-eight degrees; midnight, eight degrees. Saw a lizard a foot long on a pile of gravel; took him in landing net; saw a raven and many birds that my Mentor Leonard called "venison-hawks;" he said they would eat a deer hung in the woods in a few days, and was something like a blue jay; it was not that bird of which there are plenty on the river, and as we had no gun I had no opportunity of seeing it. Coming back a mink ran along ahead of us and disappeared in the woods; saw several suckers in the stream.

Tuesday 31st, exploring as yesterday, little or no food on the sand shingle, if any, it is moving; the black bottom showed fine leaves of cedar and pine; in shallow water I noticed larvæ of ephemera with their two long filaments in their tails, quite plenty; great quantities of caddis with their soft bodies encased in a house made of sticks which they slowly drag in search of food, while the bottom in many places was dotted with the little boat-fly who was often seen rowing with his one pair of oars. The little beetle known as a "whirligig," (*Gyrinus natator*), was also noticed as well as one "Gigantic water beetle," (*Belosomatia grandis*), whose head I pinch in every opportunity; but best of all, unless it be the caddis, I saw our freshwater shrimp, (*Gammarus*), upon which the trout get so fat. It has often been said that the common earth, or angle worm, did not exist in this country; but I saw one in the

stream; water was too deep to get it; but I am tolerably familiar with the "animal" and do not think there is a chance of a mistake in this matter; saw a spotted woodpecker. I give the scientific names of many things above mentioned where I knew them; there are some things which have no other, and they not only help wonderfully to establish the identity of a fish, insect, &c., but do so show off a man's learning that I regret not being able to give the true appellation of the angle worm, but perhaps my readers may know him. I remember a writer from the woods once speaking of a mosquito and giving its scientific cognomen for fear that it might be confounded with something else. There were sometimes near the shores the roots and dead leaves of the yellow water-lily. My trusty guide Leonard, whose vigorous arm poled me up and down all day, says that down the stream, farther than we went, the watercress is found, and he has known the stream for twenty years and can tell to a foot where the next school of grayling will be seen. He knew this fish twenty years ago as the "Jack salmon." Thermometer—6 A. M., 0 degrees; noon, twenty-eight degrees; sun down, twenty-two degrees.

Wednesday April 1st, the opening of the grayling season, for which we had waited three days; and if, as it afterward proved, it was too early to capture for the table, it was at least in accordance with the law, and for this we had waited, although it was not for the table we were here so early, but to secure live fish for breeders to stock other and less favored waters, and we did not know if their capture were allowable in March even for this. The weather being so extremely cold prevented any early fishing, and in fact Mr. Fitzhugh informs me that in summer he has never had any success in early morning, and we staid in camp until nine and watched the thermometer, at this time it got up to twenty-eight degrees and we went forth. My friend had a fine Judson rod with click reel while I had a rather stiff one, made by nobody in particular, with one of Fowler's rubber reels. Mr. F. arranged a cast for himself and me as follows:—first bobber, a brown hackle; second, a stone-wing with yellow body, and a red ibis for a dropper, at the same time telling me that the stone-wing had always been the most killing fly. Leonard and I went down stream half an hour ahead of the other boat and when he took his position I took a fish. I will not attempt a description of the "high art" with which he was landed for I don't remember it, being intent only on getting him; but when he lay along side of the boat I felt with the Queen of Sheba that "the half had not been told me."

I have read a dry scientific description of the grayling, and if the reader can tell a sucker from a quohaug clam by such description he can beat the writer. We fishermen compare a strange fish to some well known variety, and if we can't make it intelligible, why we give it up. The only description that I have ever seen that conveyed anything like an idea of the fish will be found on page 280, last vol. of FOREST AND STREAM from the pen of Prof. James W. Milner, of the Smithsonian Institute, whom the writer has long known as a man of science, and more recently as interested in fish culture, but never until this article did I know that he had all the degrees. I must quote him: "There is no species sought for by anglers that surpasses the grayling in beauty. They are more elegantly formed than the trout, and their great dorsal fin is a superb mark of beauty. When the well-lids were lifted, and the sun-rays admitted, lighting up the delicate olive-brown tints of the back and sides, the blueish white of the abdomen and the mingling of tints of rose, pale blue, and purplish pink on the fins, it displayed a combination of living colors that is equalled by no fish outside of the tropics." I have been tempted to italicise the last ten words, for they are true; but the writer of them would not so describe the beauties to the *Savans*.

"Why should a man whose blood is within warm
Sit like his grandsire cut in alabaster?"

And now I will try my prentice hand at a description of the fish for the benefit of my brother angler only. I had been deceived by descriptions, told that they resembled a sciseo; but when I first saw the fish with his magnificent dorsal fin spread I felt that those who had described it had never seen it alive.

The grayling has all the fins of a trout; his pectorals are olive brown with a blueish cast at the end; (I am describing him in the water as I saw him in my ponds an hour ago,) the ventrals are large and beautifully striped with alternate streaks of brown and pink; the anal is plain brown; the caudal is very forked and plain, while the crowning glory is its immense dorsal; this fin rises forward of the middle of its back, and in a fish a foot long it will be nearly three inches in length by two high, having a graceful curved outline, and from eighteen to twenty rays dotted with large red or bluish purple spots which in life are brilliant, and are surrounded with a splendid emerald green which fades after death; it does not seem as if this green could be represented by the painters' art; it is that changeable shade seen in the tail of the peacock.

In shape the fish is like a trout, a trifle slimmer perhaps and not so thick near the tail, but the fin on the back of a trout looks so small and square, so deficient in outline and color after beholding the graceful curve of a grayling's dorsal. The scale is large, silvery, with sometimes a copper tinge; near the shoulders there are black spots sometimes triangular, and at others V shaped; in some fish these extend nearly to the tail near the back; they are in lines which gradually shorten towards the belly; the mouth is small, nearly square when opened, and the teeth are merely a slight roughness on the lips, none on the tongue; but you want to see him come in on a line with his fins all standing and your eye will then give you a better idea than all the cold-blooded descriptions could ever do.

We took this day seventy-five fish, with the lines frozen in the loop, so that the reel was useless most of the time; often would Leonard take the end of my rod and break the ice from the eye by pulling the line through it when the reel could again be used for a few minutes until the wet line came to the rod again.

The fish we put in a lath crate firmly anchored in the stream. I saw no signs of their spawning soon, and at night I looked the fish over again, and took out a few that were badly hooked for supper. I found the eggs quite large; the membrane enclosing them had its veins but slightly filled with blood, and I gave it as my opinion, which I still adhere to, that but few if any of these fish will spawn before the 25th of April or 1st of May this year.

All authorities on the subject have said about the first of March was the time of spawning, and although I had accepted it as truth, I now wonder where and how they got their information.

One fish of half a pound which I opened had 2,000 eggs in her, more than twice as many as a trout; the eggs are much smaller than the trout's; but as we had nothing to measure with we did not get the average size. Thermometer to-day—6 A. M.: 0 degrees; noon, thirty-four degrees; sun down, thirty-two degrees.

Thursday 2d, Leonard and I went to Grayling with all the fish, and built a crate there for them; put them under railroad bridge and went back; ice running in river; much ice along shore; Leonard poled boat and I used axe on ice, brush, &c.; axe and pole handle covered with ice; going back caught four fish and found that Mr. Fitzhugh had forty; saw a saw-bill duck, or hooded merganser, wood-duck, three wild geese, red squirrel, bald eagle, white rabbit, and pair of sheldrakes. Ducks are much wilder here than in districts more thickly inhabited. Water low in river every morning and high at night. We kept on fishing, although in addition to freezing in the loop and rings the line would be coated with ice where it touched the water, this would increase until as large as a lead pencil and make it impossible to get any line out, which would necessitate biting it off or thawing by passing it through the mouth. But Mr. Fitzhugh was in sight with his overcoat buttoned up, his woolen comforter about his ears and his line solid ice, apparently enjoying it. I did not see any one else. We lost many flies to-day by touching the boat and freezing fast. I had up to noon to-day caught more fish on the red ibis than any other hook, but now they ceased to take it, and at the next loss of a dropper put on another stone wing, which did well.

About 3 P. M., Mr. Fitzhugh and Frank came up from below and hurried us in shore with the cry, "Ripe fish!" we went to the fire to thaw our fingers before undertaking their manipulation; he said that as he handled one fish the eggs flowed into the boat and so did the milt from another. There were six fish in the well but none showed ripeness as a trout does by a purple vent and soft body; I then handled them and they felt hard and I called them unripe, but did finally by using more pressure than we generally apply, bring thirty eggs; the male milted freely; the eggs stuck at first but "freed" in half an hour; after taking in all the water they would I should judge that their diameter was about 1-7th of an inch or perhaps less; the yolk appeared small in proportion; that is, there was a larger water space between the yolk and outer shell than in the egg of a trout. I had bought wire cloth and bobinett for hatching, but having given up all hope of getting any spawn, had taken them back to Grayling. I took an old piece of linen, punched it full of holes, and after putting the spawn in it and tying it up, made it fast to our fish crate in a strong current to keep till morning, but forgetting the fact that there was tide water on the upper Au Sable I tied it too high and it was out of water and frozen hard in the morning. Thermometer—6 A. M., thirty-two degrees; noon, thirty-two degrees; sun down, twenty-six degrees; midnight, six degrees. Mouse ran round the tent several times at night.

Friday 3d, snowing and blowing; fished till near noon; the wind stiffening the flies with ice; caught enough to make total 190 fish; packed up, bade a long farewell to Camp Hallock and started up the river. As an illustration of the perils of navigating the Au Sable I will relate how as we approached a huge pine lying across the stream about three feet above the water which we had gone under several times, I being in the bow threw myself back as usual while Leonard gave a vigorous push; the tent and blankets on the seat behind held my head while the pine bark removed a few inches of skin from my forehead.

Arrived at Grayling we put the fish in the crate and got the boats and traps to the station. The rest of the party left for Bay City at 8 A. M. next morning, but I dared not start so late in the week. I waited until the train went down on Tuesday morning when I loaded up 180 fish, (ten had died,) and started. The men at the station helped me load and were very kind and accommodating while waiting among them. The conductor and express man on the train carried water and ice for me and all wished the fish success on their long journey; at five next morning we were at Suspension Bridge but were eleven hours in getting the next eighty miles, as we left the bridge at 9 A. M., Buffalo, 2 P. M., reaching Honeoye Falls at 6, and in an hour they were in one of my ponds with a loss of twelve fish. These fish are from a quarter of a pound to over a pound weight; some are bruised and will probably die; others have lost an eye from hooking in the brain cavity, and three are stone blind.

Whether they will spawn this year or not after their exhausting ride I cannot say. The next day they were tame and would not stir for any one, they were so fatigued, but they second day they showed a proper degree of wildness. That they are a "game" fish I do not doubt, as they fought nobly with a few exceptions, but Mr. Fitzhugh says they were not near as gamey as in summer. He is a most enthusiastic fisherman and that he has the welfare of the grayling at heart is evinced by his earnest efforts for their protection and his endeavors to introduce them to the fish culturists.

It is useless for any one to attempt fishing the Au Sable without boats, and a good pusher is indispensable as the stream is so rapid and full of snags, there is no floodwood, but it is too deep and cold to wade, and there are but very few spots where a line can be thrown from the shore.

I have not cared to discuss their merits as a table fish in comparison with trout; an epicure would shut his eyes and then after putting on a look of profound wisdom proceed to explain that they were not alike in the least particular; but my palate is not so nicely graduated, and I will leave the fish to be gastronomically described by a more epicurean pen, merely recording my opinion that they are "not bad." The flesh is nearly white. The stomachs that I opened contained cases of caddis worms and a few traces of shrimp; the latter, however, are like the worms quickly digested but have no cases to leave behind.

The grayling is essentially a bottom fish and in six feet of water will be found within a few inches of it, and in the clear water of the Au Sable they can often be seen to start and rush upward for the fly; on this trip they took most of the "bugs" below the surface simply making a swirl on the water with the tail, some few took it from the surface, but Mr. Fitzhugh says that in summer they often leap in the air. He has fished this river for the past three years, almost every month in season; is an old trout fisher and an artistic fly caster; but since he has made the acquaintance of the grayling he seldom cares for other fishing; this fact more fully establishes its rank as a game fish than anything that I might say.

Sir Humphrey Davy says:—(Salmonia, p. 175,) "they cannot stem rapid streams and are gradually carried down

lower and lower, and at last disappear;" but the Au Sable is swift with rapids about four miles below our camp. He also says:—"He is to be fished for at all times, for he is rarely so much out of season as to be a bad fish."

The only flies that I noticed upon the water were of the genus *chironomus*, an insect not larger than a mosquito; some days the grayling rose freely at them. I did not see an insect in this stream that I am not somewhat familiar with in my own water.

While waiting at the settlement two Indians came in with pickerel (*esox*) to sell, they were dressed and heads off, said they "catch 'em in Sawble;" they had been speared and, when I asked if they did not get them in the lake, said, "No, Sawble." They had eighty pounds and some of the fish would have weighed fifteen pounds alive; they sold them for six cents a pound and said they caught them ten miles below; and yet there are grayling there among these sharks! The old dispute is kept up here as to what is a pike and what a pickerel; they have both the pike of Europe and of Canada, (*esox*), which is called a pickerel in New York, and the pike-perch, (*Luciopeperca*), which is the pickerel of Canada, or the wall-eyed pike, yellow-pike, &c. of the eastern States.

Next day a party came with black bass, of three to four pounds, from Portage Lake, where they are reported plenty; they sold, undressed, at same price as sharks.

I failed to find any stream where the speckled trout and grayling are reported to dwell together. Sir Humphrey says that they do in England, and Tennyson makes the brook sing:—

"I wind about, and in and out,
With here a blossom sailing;
And here and there a lusty trout,
And here and there a grayling."

But it may be only poetical license in his case, but there seems to be no good reason why they should not, as they require about the same temperatures, food, spawning beds, &c. The trout might eat grayling but a grayling of a pound weight cannot swallow a fish larger than your finger, and as they spawn at different seasons, they seem well adapted to inhabit the same waters. FRED. MATHER.

—Seth Green writes to us respecting the propagation of the Michigan grayling:—

ROCHESTER, April 18th, 1874.

There will be no trouble in hatching them, but it will take a pretty close observer to raise the young fish. They will be so small that it will require great care. There will be a great many difficulties to overcome. One is, to fix a place so tight that they cannot get away, and give them water enough, and another will be to feed them and not foul the water. The above hints may help those who ever undertake to hatch them. I expect to go to Michigan as soon as I hear that the fish have commenced spawning. I will give you a sketch of my trip. Yours,

SETH GREEN.

Our readers will greatly appreciate the addition of Mr. Green's observations to those of Mr. Mather's, and we have no doubt, now that the season for spawning is known, that Mr. Green will succeed in obtaining spawn, which Mr. Mather could not do because he went too early.

—The Legislature of Minnesota has passed an act "to provide for the reception and disposition of the quota of fish and spawn allotted to that State by the United States," and appointing three Commissioners, who are to serve without compensation. The following gentlemen have been appointed, viz:—Ex-Gov. Horace Austin, and Dr. David Day, both of St. Paul, and A. W. Latham, of Excelsior, Hennepin County. The appropriation of five hundred dollars is made for the necessary expenses of said Commissioners. We print section 2 of the act, as follows:—

"It shall be the duty of said commissioners to apply to and receive from the United States commissioner of fisheries such quota of stock, spawn, or fry as may be allotted from time to time to this State, and to plant such spawn or fry in such lakes and streams in the State as shall in their judgment best serve to stock the various lakes and streams of the State, and to make such investigations and inquiries on the subject of fish culture as they may deem best, and report recommendations for legislative action that will best promote the useful cultivation and growth of fish within the State on or before the third day of the next session of the legislature."

—All who saw Seth Green's great display of live fish in aquariums at Rochester last week pronounced the exhibition truly wonderful. The fish are all of the most beautiful species, and are shown at various ages from a few weeks old up to several years. The eggs in process of incubation attract much attention. The fish are all marvelously tame, although they were taken out of the ponds at Caledonia and placed in aquariums for the first time for this exhibition. The gold fish in globes are of very large size, and are also very tame. Seth Green puts his hands in the globes and pats them on the back without appearing to frighten them in the least.

—S. W. G. writes from Grafton, Vermont:—

GRAFTON, VERMONT, April, 1874.

EDITOR FOREST AND STREAM:—

I wish to bring to the notice of the Commissioners of Fisheries in New England a nuisance in the Connecticut River at Bellow's Falls. In former years we are told that the eddies below Bellow's Falls were a great resort for the salmon. Since their day all the river fish have resorted to them, and it has been fine fishing there for pike until within a few years paper mills have been built there, and they are in the constant habit of throwing their waste material from their bleaching works directly into the river. The most experienced fishermen say that the fish from this or some other cause have left, and are very seldom taken there. How is this going to affect the salmon?

NEW HOPE, April 18, 1874.

EDITOR FOREST AND STREAM:—

I received, on the 17th March, through the kindness of Professor Baird, 10,000 salmon eggs from Mr. Atkins, Bucksport, Maine, whose mode of packing I think perfection. On arrival there were but eleven dead, on the 27th were all hatched out, with a loss of only 131. As there is much controversy as to the best mode of conveying water to the eggs, I will state that I take it through terra cotta pipes, under ground, 150 feet from the spring; use no filterer; float them on glass grills attached to wooden frames. I have used them this year with perfect success, and have discarded gravel. JAS. B. THOMPSON.

APRIL WORK AMONG THE FLOWER SEEDS—THE ANNUALS AND HALF HARDY ANNUALS.

AS you have already progressed to the point in which you are to make your selection for the adornment and decoration of your future small garden plot, your more extensive border bed, or your annuals or perennials, you should now be able to know the different natures and peculiar characteristics of those flowers. A few words, therefore, upon the different flowers comprising these beds, in city or country, is absolutely necessary to be known by every one who would have good success in the cultivation of flowers. First, we speak of the annuals. Annual is the common term applied by florists and cultivators of flowers to such plant seeds as are sown in the spring, which come up and blossom and mature and produce their seeds in the season of summer, and, having performed their work, perish. There are a few other plants that are classed among these annuals on account of their blossoming the first year; among them we place the Marvel of Peru, etc. These are not in the strictest sense annuals, but they are often well treated by cultivating them as annuals. We shall follow the well known formula of the cultivator, and divide them for convenience sake into three distinct classes, viz:—hardy, half hardy, and tender annuals.

In our papers upon the subject of large and small gardens, their arrangement and treatment, we shall endeavor to be understood, and shall avoid all technicalities, choosing to use plain language except in giving the botanical names and their classification, which in no case should be omitted. The seeds of the hardy annuals do not, as a necessity, require any artificial heat at any period of the growth of the same. You can therefore plant them out in the border garden or the city plot as early in April as the ground is tolerably warm, and in the condition heretofore spoken of as fit to receive them. You will find them hardy enough to endure any ordinary weather, such as we usually have during the months of April to November. Even a slight frost will not injure them, and I have seen quite a smart frost in May, and the beds quite white from the chill. In such instances I have taken, before sunrise, a pot with cold water and sprinkled a whole bed of annuals through a fine rose jet, and you would not notice the least retrograde movement or check from the frost. It is always safe to do so. As an usual thing, when you find the seed leaf has been passed, and the third set of leaves well set, a considerable degree of cold will not affect annual flower plants. Of the annuals, many of them should be sown in the autumn months, and young plants will make their appearance early in the spring. This is an advantage, as the flowers will always be found much stronger than those planted in the spring. Remember, here, that the very best soil for the growth and perfection of either annual or biennials is a light rich loam, not sandy nor stiff, but a nice admixture of the two.

As I have remarked, in the different States of the Union different times for sowing is required. As a general rule, from the middle of April to the first of June may be called a good time. In the southern States the months of January, February, and March will be found the best to sow seeds in, as these months will more nearly correspond in geniality, heat, and other similar circumstances with the April, May, and June of the more northern States. Our southern ladies are, as a general thing, quite accomplished and well versed in floriculture, a taste for the beautiful seeming specially characteristic of those reared

'Mid the sweet regions of the southern climes.

As we can give no certain or unerring rules as to the best time either in the weeks or days, we must urge upon our lady friends careful observation and attention to certain facts always patent to certain times, and observable always.
